Amber, English, 429
America, fruit-growing in, 395 ; flore of North, 740 ; cultivation of the Liquorice-root in, 737
American Apple-crop of 1895, the, 641 ; notes, 152
American nursery, quantity of worked trees in, 770
Amphitecna nigripes, 642
Anemone japonica, monstrous, 526
Angora, Tragacanthand Persian berries in, 365
Angræcum pellucidum, 158
Annuale, 608
Anona Cherimolia, 577,619; in Constantinople, 734, 757
Anthracite coal as a manure, 73
Anthuriums, bracteate forms of, 73 ;
hybrid, from Ghent, 73
Aphides on Lettuces, 526
Apiary, the, 212
A pios tuberosa, 501
Apogamic Ferne, 211, 271, 305
Aponogeton distachyon var. Lagrangei, 215
Apple, a black diseased, 685
Apple, Ben Davis, 582; Blenheim Orange, history of, 749 ; Cox's Orange Pippin, 684
Apple crop of 1895, the, 641 ; caltare, 519 ; fruit, aecond crop of, $5 \% 6$; grafte on Pear stocks, 131 ; Newton Wonder, 710. 746 ; the Spitzenberg, 268 ; trees trained on a roof, 270 ; in shrabberies. 719 ; with skin black, 620 ; with flower at side, 430
Apples, beat varieties of, 555 ; colonr in, 556 ; Nova Scotian, 334 ; popular varieties of, 587 ; prices of, 499 ; in Normandy, glut of, 716
Apricots from standard trees, 247
Aquatics, cultivation of, 69
Araucaria imbricata, 74 ; at Bournemouth, 217
Aravja albenm, and moth-catching, 246 ; A. sericifera, 211
Arboricaltural Society, the Royal Scottish, 387
Aristolochia clypeata, 484; A. elegana, 452 ; A. elegans, in Africa, 369 ; A. gigas var. Sturtevanti, 518; A. longifolis, in Hong Kong, 306; A. ungulifolia, 44
Arnold arboretum, the, 461

Arnold, Matthew, as a lover of flower, 738
Arüichokes, 9, 648
Arandina bambusæfolia, 388
Ash, the orange-berried Mountain, 361
Asparagus cultare, lecture on, 655
Assimilation and respiration in vegetables, 132
Assimilation in plante, 329
Aster corymbonus, 372
Aster field, an English, 481; A. Manckii, $3 \dashv 1$; plante, failure of, 216
Asters, China, 152; hybrid, 620 ; suppozed nataral hybrid, 526
Astilbe Lamoinei, 358
Attar of Roses, the adulteration of, 333 Auricula, the, 643
Australia, frozen flowers from, 682; horticulture in Weatern, 678
Aastralian flowers, 301 ; timber, 335
Azalea indica alba at Penrice Catie, 129
Azaleas at Walton Lea, Warrington, 65

B
Bamboos and the past winter, 17 ; hardy, 186
Bambure Metake, 747
Bzananas at Hampton, 706; the cultivation of, 240
Bankfield, Odontoglossums at, 90
Barbarea valgaris, 217
Bard, lines to a minor, 79
Bark from Ailanthus, 619
Baroda State Gardens, retirement of Mr. Henry from, 675
Barron's, Mr., retirement, 138, 158, 161, 186. 214, 244. 246, 270. 304, 335, $337,571,372,400,682,712$; a national tentimonial to, 494,526746
Baaket, Seasell's patent Orchid-, 748 ;
West's improved Orchid-, 306
Bateman's, Mr., garden, sale at, 130
Battersea Park, Palms at, 650
Bauhinia Galpini, 452
Bean, the Climbing French, 246, 272, 304, 652; kidnev, dwarf Parisian, 167; the Carob, 264
Beech, round-leaved, 18
Begonia disease, 304, $337,544,586$
Begonia Gioire de Sceaux, 720; B $\times$ Mrs. J. Heal, 585 ; B. incomparabilis $\times, 680,715$; the taberousrooted, 267
Begonian at Mesars. Ware \& Sons,
Belgiam, note: from, 162, 182, 298391
Bollis perennis, 206; "The Bride," 131
Balvoir Castle, notes on the hardiness of some plante at, 38
Benefit and Provident Aasociation, United Horticultaral, 501
Bentley Priory, the gardens at, 556
Berlia Industrial Exhibition, 1896, 770
Brlin notes, 424, 610. 708
Berlin. the International Exhibition at, 45

## PETER COLLINSON.

$I^{\top}$T may be fairly questioned whether the annals of horticulture contain a more anomalous an individuality than that of Peter Collinson, who did more to escourage the cultivation of exotic plants during the earlier balf of the last century than any other man, and who never wrote a book! It is more than passing strange that this restless and enthusiastic cultivator should have fallen into the great obsourity which surrounds his name and his work; for even the memoir of him in the Dintionary of National Biography, by the late Robert Hant, F.H.S. (vol. xi., pp. 382-3), is from natisfactory, one or two of the most important sources of information concerning him being entirely overlooked. Posthumous fame is more of ten than not the only species of gratitude vouchsafed to men who have done muoh on behalf of their country; but if the post-mortem eulogies of Peter Collinson have been few, faint, and far between, he enjoyed the mach more substantial and satisfying adrantages of an exseedingly wide repute and appreciation daring half a century of his long and busy life.

Peter Collinson was born at the paternal estate of Hugall Hall, or Height of Hagal, near Widdermere Lake, in the parish of Staveley, about ten miles from Kendal, Westmoreland, on January 14, 1693. 4. His parents were members of the Society of Friends, and were engaged in business as mercers. At a very early age Peter developed a passion for natural history, and when quite a young man had secured the friendship of the leading naturalists of the day-Doctors Derham, Woodward, Dale, Lloyd, and Sir Hans Sloane. The Earl of Bute was another distinguished naturalist who encouraged Collinson; and it was at the suggestion of the latter that Admiral Sir Charles Wager systematised his search for illustrativeexamples of natural products during his voyages - considerable portion of the colleotions thus formed passed into the possession of Sir Hans Sloane, now an integral part of the British Museum. Collinson natarally experienced no difficulty in becoming a Fellow of the Royal Society-in his time, as present, the most exolasive of the learned bodies in this country-and was eleoted December 12, 1728, at the unusually early age of thirty-four years. He was an exceedingly diligent and asefal member, not only in supplying the Society with "carious observations" and materials for disoussion, but in premoting and preserving a most extensire correspondence with learned me: in various parts of the world. His diligence and economy of time are desoribed as such that, " though he never appeared to be in a harry, he maintained an extensive correrpondence with great punotuality; acquainting the learned and ingenious in different parts of the glabe with the discoveries and improvement in natural
history in this country, receiving the like information from the most eminent persons in almost every other."

The most noteworthy of Collinson's correspondents were Cadwallader Colden, of New York, and Benjamin Franklin, of Philadelphia. The latter commanioated his first essays on electricity to Collinson, in a series of letters, which were afterwards published,* and whioh will be found in the collected editions of Franklin's works. In 1730 a subsoription library was set on foot at Philadelphia, and Collinson not only encouraged the movement by making several very valuable presents to it, and by proouring others from his friends, but he voluntarily undertook the commission to purohase a quantity of books-a task which he performed to great satisfaction for over thirty years. At the same time he transmitted to the directors or committee of the library, accounts of every new European improvement in agriculture and the arts, and every philosophical discovery, among which, in 1745, he sent over an account of the new German experiments in electricity, together with a glass tabe, and some directions for using it.

A few months ago a very important series of long and interesting letters from Colden to Collinson, and a few from Franklin also, oame into the market at Sotheby's, and realised very high prices. A few extraots from these letters will be valuable for future reference, although botanical matters formed but one of the many subjects dealt with in these epistles.

Writing to Peter Collinson from New Haven, in Connectiont, on June 26, 1753, Benjamin Franklin, inter alia, condoles with the former "on the death of good Mrs. Collinson." "I do not," he says, "offer to comfort you by arguments drawn from philosophy or religion, sach will readily occur to a person of your understanding and piety. Natural affections must have their course. The best remedy of grief is time." A contemporary has noted on the flyleaf of this letter the following somewhat onpleasantly candid opinion:-"There was no occasion of any philosophy on this ever-to-belamented ocoasion. P. C. had few feelings but for himself, the same principle that led him to deprive his son of his birthright, when that son lay in the agonies of death, and knew not what he put his hand to, supported P. C. in the loss of the best woman in a manner that did no honour to his feelings, his gratitude, or his humanity." How far the charge made in the anonymous annotation to this letter is true, it is now impossible to say; but unsupported evidence of this kind is not of serions value.
From 1749 to 1757 Peter Collinmon aent to and received a large number of exceedingly interesting letters from Cadwallader Colden, Lieatenant Governor of New York, anthor of $A$ History of the Five Indian Nations. In the earliest of these, dated from New York, July 18, 1749, Collinaon was anked to view "a chamber fire-engine, with long leather pipes, anch an I am told are likewise uned to water gardens, and cont about $£ 5$, if from experience they are found to answer the end for which they are desigaed;" and also 200 lb . weight of red Clover weed." A letter dated agsin from New York, March 17, 1758, Colden refers at length to botanical matters, one of the sentencer being:-"I rent by laet packet to Dr. Fothergill a description of a new genus, with a drewing of the plant by her [bis daughter Jnany], which we have called Filmaurea." In another letter, dated Auguat 11. 1764, contains the following intereating paragraph:-"In nome of

- These letters ware published in three parts, under the titio of Eperimants end Obserractions in Electricity, in Loudon, in 1751. 1753. 1754, Collinson undoabtedly acting as editor of the pamphlet.
your former you informed that you had the true Scammony from Alyayo growing in your garden. I am confident it will agree well with this climate. I should be glad of some of the seed to be sent so as to now it next apring, and some of the aeed of the true Hellebore. Dr. Whytte in his latt letter informs me that the Colchicum antumasle, or Meadow Saffron, is found to be an extraordinary Dacrelia, and effectual in Dropries. I wish to have it, an I think it is not a native of this country."

Only two letters appear to bave been preserved out of the many which must have passed between Peter Collinaon and Richard Richardson, the equally enthusiastic naturalist; the have been priated by Dawson Turner in his Extracts from the Litenary and Scientific Correspondence of Richard Richardson, 1835. Neither appears to be in Collinson's handwriting, and were probably dictated by him to a aecretary. The earlier of these is dated Aagust 12, 1742, and deals chiefly with the death of Lord Petre, but it contain everal horticaltaral items, which will be

Fig. 1.-PETER collingon.
(From Nichols Literary Aneedotes.)
read now with intereat. For example, he anys, "the Laurus indica, Aldini, is nowhere to be nold; the seed of it were cent to Mr. Brewer, fresh, but they have not come up." And again, "Mr. Gordon has also had flower Obeliscotheca (Rudbeckia hirta, L. ) with a red flower; he ia the only gardener now left that has a good atove; but now Lord Petre is gone, I am afraid all utove plants will go down.

I tell you of a curionity that I saw at Captain Goffre, an Eaat India director, the true Tea-tree in great health. It was brought two or three yearl ago, a present, from China, to his wife. It is an evergreen, and is housed with the Orangetrees, for it grows on the more northerly parts of China and Japan, about the latitude of forty degrees north." According to Miller, the Tea-tree was not imported into England bofore 1768, which is, therefore an error.

Four yearu later, April 4, 1746, Collinaon again favoured Richardoon with another of thowe long and gosiping letters which are now euch valuable contributions to the hiwory of gardening. His fears aboat the decline in atove plant caltare, consequent on the death of Lord Petre, proved unfounded, for Lady

Petre appeare to have thoroughly entered into the apirit of their calture. He deacriben the great tom house of Lord Petre an "the most extraordiany sight in the world." All the plants, he goes on th say, "are of such magnitude ; and the novelty of the appearance atrike every one with pleasare. The trellices all round are covered with all species of Passion flowers, which run up near 30 feet high: the creeping, great flowering Cereas blow annally with such quantitie of Hower that urprises every one with their bearty, and athe ame time perfumeth house with their scent." He does not tell us of the size of the great stove, bat the lener one measumd 60 feet long and 20 wide, and "is full of a vast varisty of all species of tender exotics."W. Roberts.
(T) be continued.)

## PARASITES.

At a meaonable time towards the end of lant yeur (Gardeners' Chronicle, December, 1894, pp. 745.6),1 contributed a fow notes to this journal on the biological peculiarities of certain species of Viccas and Loranthas, baving, at a previous meeting of the Linnean Society, exbibited namber of apecimens of various plants parasitical on the ateme and branches of other woods plants, in illuatration of thew peculiarities. A prominent feature in that exhibition, though one merelyalluded to in the article cited abore, consiated of apecimens of Anstralian Lorantha and some of the plants on which they prey, oxhibited to demonetrate the otriking resemblance in the foliago of the parasite and that of the hont. In aome instancus the resemblances are eo close that a superficial oxamination is insufficient to detect the presence of the paraxite when not in flower. The biological aignificance of this phenomenon has been interpreted in the sense of advantage to the parasite, though apparently without any very good reason, for they are in need of no special protection to enure their existence and reprodaction. Indeed, as I have already pointed out, several of those opecies parasitic on plante having similar foliage, grow equally as well on plante having totally dissimilar foliage. Bearing on this sabject, Mr. F. Tarner, F.L.S. Botaniet to the Department of Agricalture, Sydnet, has a very interestiag article in the Proceedings of the Linncen Society of New South Wales (vol. ix., pp. 557 to 560), on exotic trees and shruba affected by Australian Loranthe and Viscums, He gives a list of twenty- weven foreign trees and shrabs that have become hoats for native parasites; yet only a small number of the latter have been observed to attach themeslves to introdaced plants-only three in fact, out of about twenty-five of the Loranthacea. They are, Loranthus celastroides, L. pendalas, ad Viscum articulatum. The last is a lestleas Misloto with broad, flattened, jointed branches, and one of the coont widely disperned species, ccearring almonk throughout Iadis and Malaya, and extending to China, Japan, and Polynesia, growing on a great variety of plants; yet Mr. Turner atates that ho never sam it growing on any native Auctralian trot except Doryphora Saseafras (Moaimiaces). Ife had also seen it growing on cultivated Peach trees, bat on no other exotic. In the Kaw Herbariam, however, there are Australian pecimen recorded as paraaitic on Pilocarpus (Rataces), Ezocarpus (Santalacex), and Baloghia (Euphorbiacex). In the Sandwich Islande it it common on Acscia Koa; in Japan and China, on Earys and Camellia; and in India and Malaya, on a variety of trees and shrubs belonging to various other natural ordern.
Curiously enough, the Loranthu that most clonelg, mimice or resembles, if the reader would rather, the native host plants, is the one that mont commonly preys upon exotic plant belonging to a variety of natural orders. This is L. pendalus, which ir common on some pecies of Eacalyptus, Santalum, Acacia, \&cc. It, and L. celastroides, between thens, have been obverved growing on twenty-vix ezotic treesend ehrubs belonging to thirteen natural ordeth Among the trees and ulrabs on which they prey I majy name the Talip; Orange, Apple, Pear, Locut, Plam, Whitethorn, Olive, Eim, Plene, Alder, Wil. nat, Oak, and Willow-a afficiently diverse variety.

In connection with the existence of parasiten paranitic on other parasites, I mentioned in my article referred to above that there was an authenticated record in Bentham's Handbook of the British Flora of Viscam album growing on Loranthas earopæus, for which I could find no other anthority. I have aince found a more definite record of the fact in Pollini's Flora Veronensis (iiii, p. 176), where the anthor, after enumerating a number of trees on which Viscum album grow, continues:-"Atque etiam alius speciei parasiticæ, scilices Loranthi eпropæi; nпnquam vero anper Qercaum apecies." W. Botting Hemsley.

## USE AND ABUSE OF POTASH IN FRUIT GROWING.

Attention has been called by Prof. W. E. Britton in the American Agriculturist to the use of the fertiliser potauh in orchards. The author says, an excess of nitrogen naually tends toward wood production and an increased growth, at the expense of the crop of frait. Potash and phosphoric acid, on the other hand, are the elements apecially suited to promote the general vigoar of the tree, and increase the quantity and improve the quality of the fruit.
The experience of many large fruit growers favours the use of potash in manuring orchards. It is most commonly applied in the form of mariate of potash, from 200 to 300 lb . per acre being considered an economical dreaning, if the orchard receives an application each year. Kainit may be used instead of muriate of potash, bat double the quantity must be employed, as this alt containa a mach smaller percentage of aoluble potash, and it is only about one-third of the price to parchase.
Professor Britton is inclined to think that the practice of applying potash or phosphoric acid exclasively is sometimes carried a little too far, and thinke that if a complete fertiliser were used, it would in many casen give better reaulta.
The reault of experimenta on the fertilining of Peach orchards at the New Jersey station shows the greatent yield of fruit per acre where mariate of potash and nitrate of aoda combined were applied; but potash gave much better reaults than either nitrate of soda or phosphoric acid alune. Potash eeemed to promote a certain vigour and thrift which were lacking in trees deprived of them.
A later report from the ame atation confirms this experience, and eryy, "potash has proved the mont valuable of the single elements, the net gain being greater than where farmyard manure was ueed." The largest net gain, however, came from uaing a complete fertiliser.
Mr. S. D. Willard, a well-known weatern New York horticulturist, ways:-"In order to have good hard wood, healthy leaves, and well-developed buds, we mast rely upon potash and phosphoric acid."
Potash was once thought to be a remedy and preventive of Peach-yellows, but experiments show this to be without foundation. In a recent balletin from the Cornell Station, Profeasor Bailey asa: "I believe that the keynote to the proper fertilising of Peach orchards is potash and phosphoric acid, and not nitrogen; wood-ashes, muriate of potash, bone fertilisers-these are some of the money-makers for Peach trees. Potash is generally the most important element to be applied directly to orchards, particularly after the trees have reached bearing age."
One of the best sources of potash for orchards is wood-ashes, but this material is so often in America weakened by leaching that it cannot be confidently recommended when in that condition. Forty to fifty bashels to the acre is a good drensing if the aahem have been kept dry. Muriate of potash is perhaps the best and most reliable form in which to necure potarh at the present time. Commercial amples generally contain from eighty to eighty-five per cent. of mariate of potash, or about 50 per cent. of actual aoluble potanh. An Apple orchard in full bearing and upon loone soil may recsive at high $2 e .1,000 \mathrm{lb}$. of potash per acre, but a normal and economical application is from 500 to 700 lb .

Thus it is seen that in a majority of cases an application of potash benefitu an orchard in bearing condition. This fact points towards one of two suppositions, (1) that the soil is generally deficient in potash; or (2) that potash is beneficial when present in excess of the requirement of the crop. At first thought, a deficiency of potash in the soil seem improbable, when chemical analysis showa that the total contents of the first 8 inches of a fertile soil gives nearly $20,000 \mathrm{lb}$. of potsah per acre, $3,521 \mathrm{lb}$. of nitrogen, and $4,400 \mathrm{lb}$. of phonphoric acid. The soil then contains over four and a half times as much potash as it does of phosphoric acid, and more than five and a half times as much potash as it does of nitrogen.
Mach of the potash present in the soil becomen available to plants ao slowly, that it has to be assisted in rendering it more soluble by some other agent, or by an application of ready-formed potash.
The ashes of fruit trees contain a large percentage of potash, and it is also present in considerable quantities in the frait. It may be mentioned that some prominent fruit-growers fail to note any benefit derived from potash alone when applied as a fertiliser to orchards, and nome claim an injary from its effecte. This fact mapports the first supposition referred to above, bat is fatal to the second.
Soils differ, and it is likely that we shall find potash very beneficial on mome soils-perhaps, on most soils, while aseless on others; before applying large dones we should ane it in a mall way and note its effect. It in aleo thought that potash applied as a fertiliser improven the quality and flavour of the fruit; it certainly tends to mataration and to the production of sugar. J. J. Willis, Barpenden.
The Rosary.

## ROSA WILLIAM ALLAN RICHARDSUN.

I read somewhere within the last few days a savere condemnation of this Rose, stating that it was so fagacious as not to be worth growing. Sarely the writer could have never aeen this charming Rose in free bush form, or climbing up into a tree, ascending a charch-tower, or clothing a housegable in a half-wild and free atate. The exquisite form and great variety of colour in the bads and expanded flowerm, the beanty of the leaven, and the prodigality of the bloom, aurely atone for it lack of aubatance and of staying power. With the exception of L'Idéal, we have nothing in the aame atyle among our Roses [Jaune Desprez. Ed.] And William Allan Richardson seems to me worthy to rank with Gloire de Dijon and Homere for the production of triking and telling effect around the house or in the landscape. No Rose can produce similar colours or anch fresh and faecinating resulte at William Allan Richardson.

The Extreme Hardinkss of Rosa rugosa and its Varieties.
Susuex seems to have been highly favoured in the matter of the safety of it Roses this year. From all I have seen and heard of the two countier, Suffolk hae been hit much harder by the frosts of February than Sussex. The county has doubtless a warmer climate to start with, and has more and greater undalationg of sarface than Suffolk, and few things are more potential in affording changes and ameliorations of climate than are hills and valleys. Rosarians, in localities less favoured by nature, rejoice with "A. P." and others who havo written in hopefal terma of the Rose harvest already begun in Sumex. And we can all find one pleasure in common, and that is the extreme beauty and perfect hardiness of Rosa rugosa in all its varieties. The only change that I have noted in thil atriking Rose this year is in the colour of the foliage. I have noticed this change before, but not to the wame extent. In mome cases, almont entire plante have become almost golden. The change of colour in the leaves has not affected the bloom, which is plentiful as ueual. Rosa.

## A PARK FOR DROITWICH.

Droixwict, though situsted in an agricultural district, find its chief mupport in the manafacture of salt. Bat this trade is becoming precarious in some reapecta, becasae the making of alt in the town is not $s 0$ great as it once was. Many of the houses appear to be losing their aupport also, and are leaning in every direction. The churche are like the houses, mostly out of the perpendicular, and the High Street has lost grade.
The town is becoming better known on account of the brine bathe that were provided by Mr. John Corbett, of Impney, who bailt ap a gigantic alt industry in the town and at Stoke Prior, four milen nearer Bromegrove. Theae bathe are rightly becoming famous for their carative and alleviative propertien in rheumatirm, ciatica, gout, and kindred complaints. Numerous visitor realise the value and importance of a prolonged course of baths, and take up their residence for weekz and monthe, according to the necessity of their case. The town, though mall (about 4000 inhabitants) is well provided with hotels and boarding-houses.

To meet the requirements of visitors, Mr. Corbett has provided a beautiful park in a central position, and within a short distance of the hotels. The site, covering nearly 12 acres, was formerly an orchard, the froits being chiefly Applep, Peara, and Medlars. Many of the trees are 100 to 150 years old, and of immente size. The ground is slightly undulating, and has a slope to the west, north, and east. Mr. Davien, the head gardener at Impney, han availed himself of the natural advantages offered by the lay of the land, and has produced, after his own plann, a park which is at once beantiful, interesting, and unique.

A few of the fruit treen have been removed for artistic reasons, but mot of them are retained, Rones, Wistarian, Clematis, Bramblew, Honeynucklen, Virginian Creepera being planted near them, so an to grow up into the crown, where they will in course of time form picture of floral loveliness. Then imagine the glory of the Apple blonnom, of the ripening golden fruit in antumn, and the feat of Rones in summer. A wide carriage-way encircles the park, and in one part is carried in a atraight line through what is an avenue of Apple treen. Wide footpath intermect, without marring the appearance of the central area, and skirt the boundary. In anitable positions are a large flower-garden planted with the unual kinds of bedding plants, a Roae garden, and an American garden with manses of Ghent Azalear, Andromedas, Khododendrons, Ericas, and other plants. Conifers and other evergreens are planted in masees about the award, and are used for masking undesirable objects and the internecting point of walka and roade. Seats and summer-housen are plentiful. J. Udabe.

## FLorist8' Flowers.

## RANUNCULUS ASIATICUS VARIETIES.

Thodar the Panty, Tulip, Auricula, \&c., are now the subjects of reviving interent, Ranunculases, the favourite flowerk of my boyhood'a daym, neem to be more and more neglected. Yet no flower is more beautifal or perfect in form, they excel most other flower in the symmetry of their shape, their brilliancy, and variety of colour; so that a bed of fine Ranunculus is a most attractive object. I have no doubt there are still some amateare to be found who cultivate Rananculuse from whom a choice collection could be obtained. The once famous collections of the Rev.- Tyso, Messrs. Lightbody and Watervon, are, I preanme, now defanct. It is not a difficalt flower to cultivate, although all kinds of ail and situations are not equally adapted to the requirements, and it has numerou insect enemies.

I do not now propose to go fully into it cultivation, but to eay a few words on soils and the raising of seedlings. In selecting a situation for a bod choose a moint tolerably rich aoil, not too fully exposed to the ann. Prepare the ground by deep
treaching, and add to the garden woil a portion of manare from an old Cacumber-frame, with one-foarth loam-mix these well together, and prepare the bed some length of time before planting, in order that it may settle firmily ; plant the roots in the end of February in rows sbout 9 inche spart, and from 3 to 4 inches in the row. Use a anerked dibber, wo that the rootu may be all planted at one aniform depth, and cover the roots from 1 to 1 linches deep. Shoald the weather prove very wet or frovty before the planta come up, protect the bed with atraw, mata, or nome anitable material. When the plants comenence to ahow bloom, give plenty of water between the rowi, but never water over the plants, which is one cause of failure; when in flower protect them with an awning from an and wet, and when the folinge is nearly withered about ix weeks after fowering, welect a fine day and take the roots up. Place thom in a room where there is plenty of air to dry gradaally. After they are once dry they mast be kept so, so the least damp would mould them. The best time for sowing the need is the middle of October or early in Jannary, in boxes or pans, covering the seed very lightly. They should be kept in a cool frame during fronty weather, and at all timen should have constant expoeare to the light. In May, plunge the bozes or pans up to the rim in the open groand, where they have only the morning sun; water them almost daily until the grave withers, then let the boxes become quite dry. About the middle of July take them ap, gradually dry them, and keep them in a box of dry and. In Febraary they should be planted and treated in the same way as the old roots. Edvoard Bownett, Iyne, Chertsey

## Teie Carmation and Picoter.

I fear the time hae come when I must be claned with the old florista; and yet daring all the yeare it has been my pleseare to caltivate the Carnation, I never knew a wason anything like the present. It has been mout trying to the show varieties of Carnations and Picotees. The scarlet and crimmon bizarres have saffered most, next the flakes, and then the choice floriata' type of Picotees. The yellowground Picotese have also felt the effects of the wet, cold autamn, and of the eevere froute in Jauuary and Febraary. All the self Carnations are doing well, and will flower very atrongly.
In the first place the layers did not form roote well, and many of them did not produce soy at all; thin necessitated late planting out or potting up, and almost before the plante became eatablished aevere frouta set in, and the roota were thoroughly frozen, thous in 60 -vized pots in frames were at hard as iron, and slthough the plante were not killed outright they were very badly crippled. Indeed, plante ware sent to me se late as May in a dying state, the cause of which I had every reason to believe wat owing to the effecte of frost apon them in Febrasy. One good effect of the frowt is the deatruction of the weakly growing varieties; it was cortainly a teating time, plant which paseed well through a winter like the latt may be regarded as nigorour enough for anything. Nothing in Carnation culture ie more remarisable than the different degrees of vigour and hardinese of varieties. Many persons have an idea that the selfe are hardy. free-growing varietien, and that the fllkew, bizarres, \&c.s, are delicate things, only fit for greenhouns cultare. There is no doubt that planta of the scarlet bizarre section are more slender in growth than the others ; bet it doee not follow that they are lew hardy in conatitation, or that they will sot atand the frowt so well in winter. Indeed, the bizarrea and fiakee do much better in the county of Darham ont-of-doors than they do in Eaver; vefficient proof that if is not altogether either front or wet that ipjare them. The degres of vigour in a Carnation is to a certain extent determined by the colour of the flowers, as may be ween by the greater vigour of certaia oporte from the bizarres. The maroon colour in scarlet bizarres, or the purple in crimsons, giving the crongest growth; and yet in sulf the whits-fiowered Carnations art as rigorous, and somatimes, ladeed,
they have greater vigour than the acarlet or erimaoncoloured varieties.
Plante of differing degrees of vigour require a different treatment. Ono semen the young gardener who had charge of my plante, gave the entire collec. tion a good dresaing with a rich compost in Msy. This answored admirably for all the rarieties that mado ahort stumpy growths, causing them to grow mach longer. Those of very vigoreus conatitation. and which prodaced long-jointed laywrs, apindled ap for bloom to an alarming extent, caasing convidorable loss. In a dry mason, sucb at this, a rica anface-dressing is a great aid to the plante. Watering hat been much needed everywhere in the south; bat watering in of little use aslese the planta can have mulching of decayed manure, and if a thorough sonking in given once in a week, that will be mach better than giving a amall quantity daily, but never safficiont to well satarate the ground. Anyone can obsarve the effect of watering on hard, thoroughly dried groand, by examining it after the water has been spplied for a few hours; it will be quite dry sbout 2 lachee below

the surface, unlew the surface has been loowened. The treatment of pot-planta requires much thought on the part of the gardener, at aome varioties make quite three simes at many roots as others, and it is afe to suy that planta require three times at mach wator, and if the cultivator is not caraful to water each, with dae regard to ita requirementa, the reatite cannot be altogather satinfactory. The time for layeriag in now at hand, and the soll ought to be prepared for it. This may coneist of equal portione of loam, leaf-moold, and sand. A little of the sarface-toll ought to be removed, and this propared meterial pat in its place, carefally trimoniag and catting the layers with a lay*riog-lnife. Any blooms that have a tendency to burat will be greatly helped by the calyx being supported with an indiarabber ring. The thrip have been troublewome this year, but there is no better way to deal with them than by patting the plata in a greenhouse and famisatiog them. It is astonishing bow mach mischief this liftle insect cas do to the flowers, it quite epoils them if left andiatarbed. Green-fy, which doen as mach harm to the layert as thripe do to the fowers, may be killed aloo by frmigating. The plants in ove gardan I viaited thim year had boen attacked by a bluck sphis, and, naoberved, it had aprand cosaider-
ably over the plasta, atlacking the bloom it po ference to the layers, this wis also destroyd by fromigatigg; it thee pecte appear before it it timo it romove the pladte iato the Caraktion-boese, the bett way to koep stem down to by ayrsainge and alo deatiog with Lobaccio-powder J. Ih whilas.

## Trees and 8hrubs,

## HEDYBARIM MILTTJICGUCM.

We are inoobed to MP. Lynct, of the Cazbridge Botazic Gandoa, for the opportavity of Areriog th ateractive handy abrab. It la a ative of Soethen Mongolia, end wes described by the lameat Maximowica. Oap lllatrasions (Gg. 2. 3) thow a leaf ad a portion of the faborvensee of the semint she, cogether with ac octlive ebowing the rpamal character or babis of sbe plack. The berbeceoce portions are covered wich a chia covering of appreend to hairs. The boikhe is 2 20 5 fool ; the bravebe are anconding, alender, rigid. angelar, etriate; the pincata leaves are somewhas distank, (w) to 30 mill long. the pione are alcornat or opposile. sixten to eighteen in namber, ovate-cate, apiculate. 106015 mill. Jong. Scipales delsold, caminale. Flowert ano merose, is erect racemes. with very abort pedicale. Calye oblique, subular, alit on the epper aide, liab nearly eacire. Sisedard violes, with yellow blockm on the middle of the janar aerfoce. a ceac. long. Wing obliguely oblong. with a long clow; keel d two oblizes helberd-ebared ecalted petale. Scamons curved, aine sed one. Rips fruis sot seen.
The plant above deweribed is bandsome hardy ahrob, which lues, wo balieve, been diutribated from the Cambridge Botanic Gardea. We bave dof conpered Mr. Lyneti's plant wish wathentic opecimensis the herbarium, bat we may point ont thas oar preeont plant doee pot ontifely corroepond with Hegel's figure in the Gertonfore, \& 1122, wherein the tomert are dewcribed and 8 gured as row-coloured.

## Colonial notes.

## A TOWN GARDFN IN NEW ZRALAND.

A prect of groosd in the contro of town, although a small obe, in act a very encouragiag place to operste on borticaltarally, bat a mixed collection all doing well may intarest onme of your reeders is other parta of the wopld. Is one corner is a bash of Aloysia citriodora from Chill, and demmed at anociate for oven $Q_{\text {iees of Spais. Is ancther }}$ corsar is a deed Willow, ap which are racing is friendly rivalry a Clomutie, a Devomiensis Row, and the white 8wat Pes Mrs. Sankey, all of Raropeal origin. Alogaid s funce aro the followiag Tou Roves, aleo from Europe: - Marie lian Hoate, Madaze Lambard, Madaen do Watheville. TMe Bride, and close by, the Rev. T. C. Cole. Not far from thees is anatus dependens, another Sonth Austican abject, sad if there it one plast mont than another is thi vegutable kingom wich deserves sdmirstion, it is this. On the ocber wide feace are Camellime from Chins, which do better planted outaide in tho shade is these regions. an indication that they are uetiven of a cemperate clime, and flourith an andergrowth is woods. Here aloo are Japanees Chrysunthewams, inclading Reolle de Lyon: bulbe from the Cape of Good Hope and other coantries above the equator, an Fresiae, Iniat, Ranuncall, Belliax, Antholyses, all Schizotylis, and the Trumpet Lily. Auother plant which Istites apon boing meen is the Coral tree (Erythrim Crista-gelli), from the cooler parts of B-azil. That grand ormamental Grase R1ymo condenestus frow Britiah Colmabia is hore, bot raquices more roote then I have for it; $n$ is Pranas ilicifolin from Callfornis. Both these wert apnt me by Dr, Franceschi, and Lavatera savargwatifolia. Abott the middle of thie plot of groand is a peodent Willow

[^1]with a rastic seat underneath inviting your leinare. Not far from this Willow is a miniatare rockwork, smooth stones being ansuitable, as they attract and retain the sun's heat-raya to a deatructive degree, in the centre of which is an Ethionema grandiflorum from Aoia Minor or the Levant, and neatling anderneath this is the modent Campanala fragilis, and a native Adiantum, which, trae to itself, refueed to grow in pota; and also the Iryleaved Cyclamen, an autumnal-flowering variety; and that indiapenable plant to all rockwork, Cerastiam tomentosam, is amongst them, bat the parity of its flowers attracts the sails. The climbing Gourd of Central America in very ornamental, but requires abundance of water. With the exception of a fow minor sabjects, all have been noted that are in this enclosure. . . . Oar own native flora hava decided objection to being removed from itm natural aanociations, as if afraid of contamination with the outside world, particularly that part above the equatorno inducements can reconcile them to any new conditions of life; ten timen out of twelve they positively pine away and die. The prevailing colour is white, as in Clematis indivisa, Convolvalus sepium, Ranunculue Lyalli,Oarisia macrophylla, the Monntain Primpose, after the way of Japonica, but with whorls of pare white flower: ; Plagianthue Lyalli, one of the dwarf ribbon-trees, with clasters of lovely white flowers npringing from the sides of its brancher, which at first sight reaemble a Tydea. Then there are many apecien of Veronica, Olearia, Pittosporum, Cordyline australis, the latter a common feature everywhere, all with white flowery, and many othern, discovered within the last twenty jeare, many genera of plants hitherto unknown, owing to the difficulty of getting into their native wild. For the information of those of your readers who are unable to underatand what being loat in a forest meana, let them for a moment imagine themaelves in an immense area of densely-wooded country, consisting of evergreen treea, shrube and Ferna of all sizen and agen, many square miles in extent, and far away from any human habitation, the proatrate trunks of trees in all directions rotted with age, the atems and branches of climbing plants impeding progress at every ntep, Mosses and Lichens hanging 2 or 3 feet long in their nilvery gurb, fitfully lightivg up the gloom. Add to this the oppressive, dank atmophere. You shout (or cooey) for help, but the sound seems mockingly reeechoed by the native birds; in attempting to extricato yourself you are found taking a circuitons roate; it is then you feel what the word " impenetrable" and "deupair "really mean, and what it is to be lost in a buah or foreat. Yet there is an inexplicable fascination in the perilons ponition.

## THE ARTICHOKE.

Thas plant is of Greek origin, and the ancient Greeks engaged in ite culcivation; atill more so the Romana. The Greeky called the Artichoke Cynara, 30 did also the Romana. Pliny, combiniog it with the Apallean word sclarea (Cardoon) called it asealia, otherwise Carduus, and the Italians of the middle ages Articocce, from which our modern term Carcinofe is derived, which pointe to the similarity exiating between the furm of the cones of Pinas pinea and the closed flower-head which afford no wellflavoured and wholewome a food. Bat as all the parts of the Artichoke are pleasant eating-rootu, leaf-talke, stems, and flower-hesds, to the Neapolitan of to-day calls it atill Cardoni, and the head especially Carcinoffe. The true Artichoke is without doubt not Italian, but of Greek and oriental origin; yet we find the later Greeks praining the Artichoker of Sicily for their apecial good quality, and this is true of them at the present time. That the bee-attracting, gigantic, handecme flowere which apring from the delicious bud attracted also the ancients, whone only trouble was the numerous prickles, which are nought for in vain in the beat varieties of to-day.
There were in ancient times many different forms; an 1 , at has been mid, the Sicilian varieties were

 CAMBRIDAE: BOTAMIC GIRDEX.
celebrated. The Spanish Artichoken are dark parple-almost black; and the further north it in grown, in rainy, foggy climaten, the violet colour disappears, and is replaced with green or greygreen. The Spanish Artichoken are, like the Cardoons, upright and tall, the bude hidden from view, and the ribs of the leaves of fleethy connistency, as in the Cardoon. Pliny extolled the Carthaginian Artichoken for their great size, snd thone of Mauritania for their excellent flavour.
In the present age, the Artichokes of Naplen and the Campania, in aize, tenderness, good flavour and fruitfulness, excel all others, even thowe of other parts of Italy, and it is believed that thene fine forms of the plant originated in northern Africa. The sncients gave mach attention to the cultivation of the plant, and we are told that large quantitien of manare and diligent atirring of the oil were required to render the bade tender-eating, and increaze the fruitfulnens of the plants as well. It is a maritime plant, and loves proximity to the ocean; it should, therefore be chielly grown on the coatt; and with the ready means of transit found in most European countries, there would be no difficulty in sending the produce inland. The ancienta increased the plant by means of the side-shoota or arckers, which the root freely prodaces.
In the spring, the sarface of the Campanis, covered by enormous Artichoke field, astonithen the traveller, who sees it for the first time with the abuadarce and bearty of the planta. No other vegetable can compete with it in productiveness and value, rivalling Asparagus in flavour and wholesomeness, and in the simplicity of the methode of cultivation. The profits of the Artichoke-grower are enormous, exceeding anything obtnined in France or Germany for vegetables, even auch a good paying crop as Asparagua.
In Italy the plant resta daring July and Augurt, allowing the land to be inter-cropped with nome quick-growing plant. When the heat of the aummer is past, and the antumn rains begin to fall, the plant commences to grow anew; this is the best time to remove the side-nhoota (auckers), and traniplant them. These shoots soon poin roots into the soil, and to grow faat, and may be depended upon to prodace heade the coming jear. In November, the plant being in full growtb, is well dressed with manure. To do this, the leaves are bundled up together, and trenches are made at the side of the plant, and pig-dung-water is poured into them; over this is placed half-rotten stable-dung, and the earth is returned over all in the form of a ridge. In about foar weeks another application of liquid mannre is made, and it does no harm if this be followed by another in January. Tbere are varieties in Italy which produce beads at Christmatide, and some that grow the whole year; but the usual harvest period is from the end of February to the middle and end of Joly; in Sicily earlier, and in northern Italy later. The beade are cut with a atalk and a neighbouring leaf before the parple flowers expand, and tied in bundles for the marlet. Some special varieties are of the aize of a child's head, and some have a epiny calyx, these being the bent flavoured. The plant is of ase to man and animaly from the root apwards, and the dried stem: are oned for fael. Extract from Wiener Illustrirte Garten-Zeitung.

## VEgetables.

pea cannell's english wonder.
Those who have not ae yet grown this Pea should do so. As a d warf-growing Pea it is one of the beat in commerce, and in gardens of limited area, and where stakes are not obtaiabble, as is often the case with amateare in town dietricts, a Pea like this is a boon. In height it is about 1 foot, and requires bat 15 inches apace from row to row. The quantity of pode produced is simply attounding. The advantage of this variety over American Wonder is the excellent way the pode fill. I have before me two pode, a fair anmple of many; one measures barely 24 iaches long without the atalk, and contains seven extra largo Peat. The second pod is jast $2 \frac{1}{2}$ inches long, and has eight Peas closely packed inside. If this Pea contained all these pointe of advantage, and wss of iodifferent fiavoar, I thould not appreciate it even then, regarding, as I do, glayour as being of the firt order. Cannell's Eaglish Wonder has no fault as regard flavour, and it is an acquisition in every respect. Sown on February ${ }^{28}$, it wat ready for uee Jane 7. $L_{C}^{\prime} \boldsymbol{M}$.

## A LIST OF HYBRID CATTLEYAS.

THE following list has been compiled by Mr. Chapman, gardener to R. I. Measures, Esq., in the same manner as was followed in the list of hybrid Cypripediums previously published. Of this latter list, copies can be had on applioation to the Editor, it being understood that the proceeds are given to the two Gardening Charities. This list of hybrid Cattleyas is made up to May 1, 1895.

A LIST OF HYBRID CATTLEYAS-(Continued).

Nursery Notes.
SWISS NURSERY, FARNEAM, SURREY.
Nor in the ordinary acceptation of the term is this a nursery, because it neem to be more generally utilised for the production of seed crops, and in this direction very likely it present some features of intereat that ordinary nurterie lack. The place is nituate on a somewhat barren-looking heath, about $2 \frac{1}{2}$ miles from the famous Hop-town of Farnham. If a matter for congratulation to the local renidente that Mr. S. Mortimer has pitched his tent there, it is all the same a matter of some difficulty to thoas at a distance who find Rose Lodge is not a convenient place to reacb. The site seemed, at the outwet, to have been on thia barren atarved-looking heath, about aupromiaing an one as conld be for a nurwery, but no one can tell the full capacitien of ground until it is fully teated. Now, after a few yeart of deep working and good cultivation, it in found poseible to grow first-class show Dablise in quantity, yet arrounding heath-land looks an if it would be dearly purchaved at 20 s, per acre. Amongat other accompliahments, Mr. Mortimer is a capital Dahlia florist, and he has put out this year of "shows," fancier, pompons, Cactus, seedling", \&c., about 1000 plante. These are in everg case about 4 feet apart each way, are all neatlv ataked, and well mulched with long manure. Tinis latter usefal
article, by the way, hat to be brought about 6 milen, from Alderahot, at a cont of 10 e, per cartload. Even on this apparently dry elevated apot Violas do well, a long row of old plante of the pretty Conntens of Kintore presentiog a charming sight. Still, the soil is far more retentive of moisture than in the long drought could well have been expected. Water is almays found at 6 feet from the nurface, whilst half a mile away a depth of 180 feet has to be dug ere water is found.

The wonderfally pretty Nemenia atrumona Suttoni is found here in great quantity, and blooming freely. The plants were raised under glant, then planted out in various blocks of colour, and these are found to come pretty true. Some of these hue are rich a'most beyond dencription. Within the houses a very fine lot of seedling Coleuse may be seen, atrong plants, in 6 -inch pots, of varying heights. Size of leafage and coloration all are beantifal, some saperlatively so. Who would take the trouble to grow these plants from cattinge and winter them, when from a packet of seed they can obtain wach a wealth of beanty and of variety? These are grown expresoly to produce seed; very tiny in the seed, and the greateat care and patience is needed to collect it. Celosia pyramidalis again forms a very beatifal feature; the plante range from 16 to 24 inches in height, are of perfect form, have many singularly rich colours, and are indeed charmingly effective for ordinary decoration. All the beat worte of Fuchaisa
are grown, bat only as old pot-plante, dwarf bushes, jast to furnish cuttinge, we these, when rooted, are sold in great quantities. They root in shallow boxen, filled with the arface-and from the heath, with remarkable ease.
The chief aubjects of the housen, however, are Tomatos, Melons, and Cacumber ; of these latter, hage crop of seed-fruite have already been taken off from January plantinge, and other plante heve taken their places, to give a second crop. Thene are chiefly grown in wooden trough about 20 inches wide, having open or trellis bottoms, and atand over the hot-water pipes. No plants could do better than thene, none could be healthier. The houves are low spane, and being well down in the ground, alway have a moist atmosphere. Cacumber Marvel, shown recently at the Drill Hall twice, is represented here by younger planta now in full fruit. The sample hanging remarkably handsome, mooth, even, and green in colour, with scarcely any heel, and about 16 inchea long, is as, perfect a variety an can be denired, and is a heavy cropper. Of other varieties grown, Sutton' Prize-winner, Improved Telegrapb, Al, and Rochford's Market, are now in growth or cropping. Success, Lockie's Perfection, and other varieties are aloo grown as needed. The jear's produce of fraits is indeed heary, and the seed crop a great one.

Melons are grown for seed and for trials, Thene are chiefly put up in Orange-bozes filled with soll
the plants being about 2 feet apart; they are, as are the Cacumbers, trained up beneath the roof on wires. Melons and Cucumbers sometime are grown in the same house, getting almont identical treatment. There are juat now, perhaps, thirty or more varieties of Melons being grown. All have good, even-aized, hand momely-netted fruite; none are big, or ungainly, or mall. Every one is prenentable, and they harg thickly. The largeat crop of any one variety is Eclipue, a grean-flesh, of great beauty and of high glavour.

Tomatos of all the best vorta are grown, both as arect or upright plants, and trained to wire under the glass. A fine new 100 -feet house, having plants put out in rown of four on each side, and 3 feet apart, aesma to preaent as admirable a atructure for the purpone as can well be conceived. The sorts are Conqueror, very early ; Perfection, Mitchell's Hybrid, A 1, Ham Green Favourite, Beat of All, Abundance, Frogmore Selected, \&c. There are no unduly large fruits. A good amooth, medium-aized ample, firm, and richly coloured, in mont enteemed. Thin house is very light, has ample ventilation, and the plants are in perfect heath. About 12 cwt . have already been taken from it, and fully 8 cwt . more fruits are maturing now. Tomatos are grown for market, and so far the return for good samples seem to have been most satiafactory. Mr. Mortimer' exhibits at the Drill Hall and elsewhere fully whow that he ia a first-clase cultivetor. A. D.

## Cultural Memoranda.

## PROPAGATION OF RESTIO SUBVERTICILLATUS.

Tex propagation of thin rare Cape plant, I believe, has hitherto been effected by the divieion of the roots and rhizome, and by this method the triala have often been attended by failure. Lately, roota ware noticed about the noden of the stem, apparently apriaging from the base of the young growthe, but only apon stems of not leas than two or three year old. Several stem were taken off and cat ap, learing about a coaple of incher of old stem with the node in the centre; these were put into thumb pote and placed in a handlight where they were shaded from the an in an intermediate temperature. Hers in about a month's time tio plants in some casea begen to root, and when root action is once set up the growth in vigorous. As the plant in a small state would be useful as a decorative plant on account of ith long feathery plame-like ntems, it should soon become more generally known in our gardena. Grown in a cool greenhouse, it soon forms a very large plant if encouraged, and for planting in large structure is always pretty and attractive. R. L. Harrow.

## The Wzek's Work.

## TEE KITCEEN GARDEM.

By Jomor LavsirbT. Gardener. Powis Cante, Webhpool.
HINTS ON WORK IN GENERAL -Owing to the drought, gardeners in most parts of the country will be beavily handicapped in this department, and in some dietricta crop will have been lett uathinged in the hops of rain coming so as to render the work possible. Where rain has fallen and the land is moistened, the thinning should be forthwith completed. Other crops, nuch.as Salafy, Scorzonera, Tarnipm Beetroat, late Onionm, and Canlifowern, wili need heavy application of water at the root and byringings of the foliage. Go over the plantation of Cauliftower at whort intervals of timo. protecting the head by breaking down a leaf or two over them. For how Caulitower I would not recommend thil al general practice, and certainly not in the case of Aatamn Giant, the heads of which rariety are a long time in coming 20 perfection, and breaking down the leavea sometimes lete in the light at the aidea. It is a better method to gather up the leaves near the tops, and tie them loowly together, not eruuhing them. This allowa of on expmination of the head by removing the tie.

Another, but more costly way, is to use two thicknesses of calico which fit close, keep out damp, and the heads readily develop underneath them, and keep perfectly white. Safficient care is, I think, not taken by some cultivators, or we should not see so many badly-coloured Caulifowers in August on exhibition tables. The best way to keep fullgrown heads is to stand them in an erect position in a cool, rather dark ahed or cellar, with the roota in damp noil. Ds not crowd them together. If the roots are plunged in water, as is sometimes advised, the card soon opent. Do not be over-desirous of size in Cauliflowera, but cut or lift them when the curd is firm and white.

BROCCOLI.-Carefully prick out the bent plants from the seed-beds when large enoagh to handle, the plants being more easily looked after in these scasll beds until wo get rain than when planted in the quarters. I do not advise early planting, or on soil that is loone or very rich. It may not be amiss to describe my method of procedura with Broccoli in 10945 , as it was generally a disastrons year for them. Oar hardent frost wan $35^{\circ}$, or $3^{\circ}$ below waro. The seed was sown on May 24 and June 13. The majority of the plants put out were of the June aowing. These plants were planted direct from the need-beds.

CELERY.-The main crop of Celery should now be planted, affording the plants one good watering to settle the moil. Damp them overhead after hot days.

THE SOWING OF BEED8 OF COLEWORT8.-A sowing may now be made of Colewort and earlyhearting Cabbagen for autumn use, making other sowinge of the ame in the course of a fortnight.

HERB8.-The cutting of herbe for drying shoald take place at soon an any kind show flower, if later than this the leaves drop. Parsley should be gathered in quantity for drying whenever it is plentiful. When dried and bottled there is a great saving of green Parsley for flavoaring purposes effected.

## PLANTE UNDAR GLABS.

## By W. H. Sxate, Gardener, West Dean Park, Chichester.

PLANTS IN FRAMES, -By this time of the year Freeria bulbs should be thoroughly ripened, and maj be shaken out of the soil, the large-floweriag ones being put on one side for potting. The smaller bulbi, so as to economise pace, may, when the suitable time for starting them arriven, ba planted in boxes. The Bride (Gladiolus Colvillei) and other varietien of Gladiolus cultivated in pots should be placed in the open air as soon as the Howara have faded or are removed. Afford weak manure-water occasionally to them till the growth begins to die down, when clear water only may be afforded, and then very aparingly.

NERINES should be oxamined, removing decayed leaves, sud cleaning the plants generally. Thone which are showing for flower should be separated from the rest, and the anil afforded a thorough watering. The tock of Nerines should be examined every few day, for no sooner in a flower-spike viaible than the plant needs water at the root.

SALVIAS may be removed from the frames and potted on in their flowering pots. Guod loam and leaf-soil with plenty of well-decayed manure will auit them. After re-potting, place them out-ofdoors on a coal-ash floor, syringing the foliage daily, and affording planty of water at the roots when the pota are permeated with the roots. Lat the plants be provided with neat stakes before they become tall, or damage by wind or heary rain may occur.

MIGNONETTE. - If large pots of Mignonette are required in the early winter months, seed hould now be sown, three or four eed baing placed in a many 60 -potn as may be considered suffizient for the densud. These should be filled with loam, leafsoil, and finely-broken old mortar. Make the eoil - Dery firm before sowing, and cover the seeds to the depth of a quarter of an inch, and place the pots out-of-doors on the north side of a wall, Mignonette
ancceeds if kept partially haded daring the nammer, and the soil never allowed to become dry. A few of the best varieties for winter are golden Qieen, M lles' Hybrid Spiral, Parson's White, Garraway's White, and Matchet, the latter being sown a little later and kept in maller pots; the habit of the plant is very dwarf and bushy.
herbaceous calceolarias.-Sow the seed in hallow pans filled with ifted loam and leaf-noil, previously moistened thoroughly, cattering it thinly on the sarface. Do not cover the seeds at all, but after pressing them into the moil place a bit of glass over the pans, and keep shaded till the seedlings appear, when more light and air should be gradually afforded.
vallota purpurea.-This plant, as soon as the flower-apikes puah up, requires abandance of water at the roots, and a slight top-dressing of Clay's or some other fertiliser. Sickly plants should be shaken out of the soil, the bulbs wahed in water, and repotted in turfy loam, leaf-soil, and wood-ashen or charcoal in the proportion of one hovelfal to one bushel of ail. Rymove the flower-spikes from all weakly bulbs. The plant should be lightly shaded till they are firmly established.

## THE HARDY FRUIT GARDEIT.

By W.Pope, Gxrdmer, Highelere Castle, Newoury.
FURNIBHING BLANK SPACES ON TRAINED TREE8. - It sometimes happens that unaightly blank occur on Peach and other trained treen, owing to bad attacks 0 : blister or mome othar cause. The efmmetry of the tree may be reatored and fresh main brancher secured if deaired by inarching, and the operation should be performed now or daring the next two months, when the young shoots attain the requisite length and firmness. Saitable growing shoots hould be inarched on to the bare portions of the older branches. The method of operation is much the ame as in ordinary budding, but in addition a tranaverse cut has to be made at each end of the longitadinal slit in the bark, which should be on a clean healthy branch; and about $1 \frac{1}{2}$ iach in length. Raise the bark carefully with the handle of a budding-knife, then take a thin alice of bark and wood from the young shoot on the ide to be joined to the atock, and place the growth thas prepared under the bark, alterwarde binding it closely, yet not too tightly, with aft matting, or budding cotton. When the anion is effected, which, under favoarable conditions, will be in the course of a month or two, the young branch should be half cat through below the juaction, and after a further interval of a few weeks, it may be severed entirely.

REMOVING GNAGB FROM PEACH-TREES.-Look over and remove anags of dead wood from Peach Nectarine, and Apricot trees, paring auch off closely and neatly with a sharp knife.so that the wonad will heal over before winter. Young, newly-planted, and other trees that may have been cut back require special attention at this meason in this matter, such snage, in addition to being unsightly, form harbonra for insects later on, and are otherwise injarion.

RABPBERRIES are generally looking well this season, and there is every prospect of a good crop. See that all fraiting canee are properly secured to wires or other supports, and protect from birds by fixing nets well above the planti. which is batt done by erecting a light framework of wood anfficiently high to allow room to walk ander, then stretching net over all. If surface suckers have been removed, and only anficient for next year's requirements have been reserved, this will admit more light and air to the crop of frait now maturing, and it will utrengthen the growth of thome reserved for fature fruiting. If it be desired to form new bod from sarplas suckerm, thene may be atopped at a fort in height, no as not to interfere with permanent canes.
protecting red ano white currantbLose no time ia protecting Red and White Carrants by netting if birds are troublesome. First make are that all are free from caterpillars or aphis. If caterpillars are present, the bent remedy is handpickiag; whilstaphis may be destroyed to a grest extent by first taking off and destroying all infested tops, afterwards thoroughly washing the trees with clean, soft-wster, applied with force from the garden-engiae.

THE FLOWER GARDEN
By Bailez Whids. Gardener, Birdsall Gardens, York.
raising roses from seed. - The cronsfertilisation of Roses is not much understood or practised in this conntry by amatears ; it is, however, a most interesting occupation. In our uncertain climate, the plante operated apon should either be grown ander glass or in a sheltered part. The flowers selected as seed-bearers would require to have the stamens removed with a pair of finelypointed sciasora before the pollen han become matare. General Jacqueminot is a variety which should be
fertilised, or the pollen ased to fertilise otheri, in fertilised, or the pollen used to fertilise others, in
about four hours after expanding; and in determining the time, a good deal of attention in required, for if the pitilis are not nearly matured, they will not be in a condition to be fertilised. The petals are then gently palled off, the stamen cut away, and the pollen applied to the atigma of the seed-bearing flowers by the aid of a camel'shair pencil, or by gently rabbing them with the bloom of the fertilining sort. Very doable flowers do not make auch good seedbearers as the less doable ones, and they posseas less pollen. Atter the operation the fertilised flowers should be enclosed in fine netting to ward off flies, \&c. The ripe seed-podm or hips when gathered should be baried in damp and until the beginning of the year, and then sown in pota or boxes placed in gentle heat. The seedlings appear in a few weeka, and will require carefally potting and planting out when all danger of froti is over.
pleasure arounds - Gras lawns that have become browned by the recent dry weather thould not be mown very clonsly. Raise the knives in the machine well ap, and remove the graas-box, $s 0$ that the cut grans may remain as it is scattered about by the machine; it will then assint in keeping the lawn green. If the lawn has not been mown for some time owing to the drought, it will be well to mow it lightly over with a sharp scy the before the lawnmower is used on it again. Grast-edgings should be kept tidy by clipping with the edging-shearm, and narrow verges of grass in dry situations require to be well watered daring dry weather.

8HRUBBERY BORDERS AND BEDS should be frequently hoed and raked, to give them a tidy appearance. Gravel walk and drives which are made with materials that become very loose during dry weather should be watered and rolled. Keep them clean from weeds by hand-weeding, or by applications of a weed-killer, which is a mach cheaper process in the end than using hoe and rake to them, especially where large gravel is used. The watering of trees and shrubs that were planted late in the season should be continued during dry weather.
rosemary (rosmarinus officinalis).-Seedling plants of this useful sweet-scented undershrub that were raised in the apring thould be planted out into sheltered situations against walls or other places where they are likely to stand well through the winter. They are unable to stand the winter in the north in exposed places, or on cold, wet soil. They may be propagated by cuttinge atruck in gentle heat, or by layering. The present time is a good one to make layers from the old plants into a light, ricb, well-drained soil. There is a great demand in most gardens for this very valuable plant.

LAVENDER (LAVANDULA 8PICA).-This popalar sweet-scented plant requires a warm, light, loamy soil ; it is easily increased by seeds sown in gentle heat in the apricg, or by layers of it pas down now, and planted out in Augunt or September, when it has become well rooted. It should then be planted in rows about 3 feet apart, or it may be planted in shrubbery borders in place where it can get the full saulight, It require well-drained soil, and in northern districts shelter from north and east winds also. The flower-spikes should be cut when the bottom part of the apike begine to tarn brown. If they are long enough, they shaculd be tied tightly just below the flowert, then tarn up the stalks, and tie the ends to form a protection for the flowers, which will last much longer if tied in this way.

PRUITS UNDHR GLABS.
Bu Riciard Pabrer, Gardener, Goodwood. Chichester.
PINES.-As the fraits are cat from the plants, the old foliage may be shortened back to allow the mickers to develop as much as ponsible. Keep the roots in a moint condition, and byringe overhead and
between the pots during bright weather, allowing a little manure-water to collect at the base of each sucker to encourage new roots. Only aufficient shading ahould be afforded to prevent the young foliage being damaged, plenty of light and a fair amount of ventilation being necesary to promote aturdy growth. In the meantime clean some 6 inch pote, and prepare a good heap of compont, ready for potting up the auckera as soon as these are large enough. The compost will be all the better if prepared some Tarn it over well severs times, so that the whole be thoroughly mixed, and let it consist of good tarfy loam, apent Mashroom dung, crushed charcoal, and sharp and, with a alight dasting of soot. Keep the soil covered with mate to prevent it becomiag diry. The poteshould heve one large crock at the bottom, and a few finer one placed over; or what is better, a aprinkling of broken oyater ahells. The house or pit in which the young stock of plant is to be wintered hould be thorougbly cleanned, and the planging material renewed to enare a steady bottom heat of about $85^{\circ}$. Smooth Cayennen ahould be induced to throw ap of few trait in auccestion from now onwards, so as to keep up a regalar sapply during the autumn and winter months. Commence to feed the plants an moon as there is the appearance of frait, and encourage growth by giving plenty of heat and moisture. Frait in different pleace of held stages should be kept in an upright position, as the the crown to grow on one aide.

MELON8.-The hot weather has caused these to turn in quickly; and where naccessional crops are not following clonely, shading ahould be efforded to those changing colour, to retard them as much as ponaible, and as the flavour of the fruit improvea by being allowed to become thoroughly ripened on the plant, it is better to shade the roof-glase than to cat the frait before it ir ripe and atore away in a cool place. Later crops in different atages of growth should be frequently dressed with frenh loam, and well sapplied with moistare at the roots, and the foliage kept regularly as ringed in hot weather. Seed may still be sown to raise plants to supply frait during September and October, but the houses in which these are to be planted must be thoroughly cleanaed and fresh soil afforded, or it is likely they will prove a failure from the attack of red-mpider, and the poorness of the noil that has produced a previous crop.

WINTER TOMATO8.-These were recently potted into mall 60 's and placed on ashes in a cold pit. To ensure plenty of fruit during the winter, the plants must be grown well daring the nummer month. As soon as ready, these plante will be put into $6 \cdot$ inch pota, and again placed in the cold pit, until eatablished, when they will be atood on ashes in a annny position. By the end of the presert month they will be ready for the fruiting-pota, which will be 10 -inch ones. In the final potting a space of several inches should be allowed, so that the plants may receive several top-dressings as the fruit plants may receive severat The plant bould be staked and placed in a sheltered place, but one open to the aun. All side-shoots mast be kept piached, and each plant grown on the cordon as tem. By the end of September the plants will be from 4 to 6 feet higb, wit I clusters of fruit in different atages of growth, the whole length of the tem. Avoid too rich a $\begin{gathered}\text { nil } \\ \text { when potting, as it is }\end{gathered}$ beat to feed the plant alter the fruit is set. Keep the roots well supplied with moistare, but should period of wet weather set in, see that the drainage ifree, and the poss ahould be stood on a couple of bricks.

CUCUMBERs.-A few plants may be raised now to supply fruit during autumn and early winter, and chus asve to a great extent those plants intended to yield fruit from Docember onwarde.

## TER ORCHID EOUSES

By W. H. WHITR, Orchid Grower, Bwrford, Dorking.
CATABETUMB, MORMODES, AND CYCNOCHEB. -Thene singular and interesting Orchids now growing rapidly, enjoy strong heat and a clear light whilat growing ; and a capital place for them in in the East Indian-house, where they may be suspended from the roof with their foliage about an inch or two from the glany. The flowern appear an the bulb get matured, and until the growth is fully madn up mastared, and until the growth is fully man up abandant watering is required by the plants. After
flowering is pat, the plante should be expored to
full annhine, and be plentifully applied with water at the root till the new paeado-balbs are sipe and the leaves fallen. Cyrtopodiam Anderwonii and C. punctatum will require imilar treatment, bat theee flower daring the apring monthe, the apilew appear ing in conjanction with the young break.
brouahtonia, banguinea, etc.-A very atriking Orchid now in bloom is this speciet, which is worth adding to any collection. The colour of ite flowers is deep red, and these last for a long time in good condition. It nucceed when fastened on to in wooden rattor block, with a little sphagnum-mons about it, and suspended from the roof of the Mexicanhouse. The ame kind of treatment as that afforded to the other inmates will suit ite requiremente. Another beautiful pecies which anually doen well in the Mexican-hnuse is (Idnntoglossum citromam. Its flowering season is now over, and the young growthe are on the move. Any plant that require fresh material or more space should be at once attended to. Backeta are preferable to potm for this plant, as when auspended the racemes of blonsom are seen to better advantage. They ahoald have a light position, and water carefully afforded till the new growth have made some progress or decay may realt if the roots are not in full sc tivity. When established, abundance of moistare il necesary, the plants being placed in nearly full and shine, and a good overhead syringing administered at closing-time every day. If the plante mant be grown in the shade, lens water at the root will be required, and syringing may be dispersed with Barkerias require exactly the same kind of treat ment, and now that these plants are in fall growth the young shoote should be frequantly examined for mealy-bug, which if not kept in check will disfgare them.

EPIDENDRUM RADICAN8, which has been in flower for several months, hould have the flower-miket removed, the plants having started into growth. I: is a plant of a scandent habit, and the ahoots should be tied around a few neat stakes, keeping the young growth well up toward the light. I hroughout the growing season, it should be kept moist at the ront, so frequently syringed overhead. E. radican may be easily propagated by taking the offehoot which appear on the old growth and flower-atems, and inserting them thickly around the edge of a flowerpot, in well-drained aphagnum-mont.

EPIDENDRUM BTAMFORDIANUM is DOW starting new growth from the base of the current jear's spikes. It is a species that has baffod numerous cultivatore, and from the information which I have received from Mr. C. Payne, who for a long time succesfully cultivated the aplendid mpecimen exhibited at the recent Temple nhow (see Gardeners' Chronicle, p. 687. with fig.), the principal cause of failure appears to have been through affording it tco much heat and moistare. The plant, when it came ander Mr. Payne's care about a dozen years ago, wa a very little piece, with only a few pseado-bulbe, and he put it into a small uballow pan, affording it plenty of drainage, elevating the plant well above the rim, and using as compost two part of rough fibry peat to one of phagnam-mnes. It was placed in a light moint corner of an intermediate-house, where, with carefal attention as to watering, \&c., the plant soon began to grow luxariantly, and it has continned to grow and bloom well up to the present time. Daring growth, and until the flower-apikes became well adranced, abundance of water was alway afforded, but as the flowers commenced to open lese water wai afforded, and at no period wat the plant allowed to become quite dry. The proper time to re-pot E. Stamfordianam in about the time that growth recommences. I may mention, that according to Mr. Payne's recommendation, I have placed several small plante which for yeara pat bave been gradually deteriorating, in auch a position as above indicated, and they already appear to appreciase the change.

Roses.-365゙6 Rone bloom were ntaged, an wh learn from the ecretary, in competition at the National Rose Society's Southern Show. Tae total sbove given does not inclade the Rover extibited in the section for garden Rowes, and in the decorative clases. With the exception of those at Birmingham in 1890, and Chester in 1892, this wes the largent provincial exhibition that has yet been held by the Society.

CORRECTED AVERAGE TEMPRRATURE FOR THE ENSUTNG WEEK, DEDUCED FBOM THE OBSERVATIONS OR FOBTY-THRER YRARS, AT OHISWIOK.-63'.3.

Messbs. R. Wallace \& Co., of
Calochortus.
Colchester, send us a box of out flowers of some of their varieties of this lovely genus. Their markings are so delioate and so intricate, their shades of oolour so nively graduated, that a verbal description is more than ever inadequate to conver an idea of their beauty and variety. There are still many who care little for the signifioanoe of all this variety and beauty; to them the flowers are beautiful, and that is enough. But the real plant-lover finds in them an added interest, and is able, in some degree, to invest the material with the spiritual. Taking the flowers before us, it is obvious that all this variety of oolour and spotting is conneoted with the fertilisstion of the flowers by inseots, and we do not doubt but that adaptation to parpose direotly or indireotly governs the whole arrangement. It is curious also to observe how the same end is aooomplished by various means. Thus, in most of the flowers before us there are "eye-spots," and fringes of coloured hairs to attraot and entangle the inseot guent, perchance to bar the passage to undeairable visitors. In all such flowers, so far as we have seen, the stamens and the ovary are pale-coloured and relatively inconspionous, but in one labelled C splendens stroviolacens, the flower is self-coloured, pale lavender, thinly besprinkled with whitish hairs, with no eye-spots or blotohes, and no fringe or pad of densely-oompacted hairs, such as are met with in the other forms. On the other hand, the atamens and the ovary are of a rich purple coloar!

What the insects are which visit thene flowers in their Californian homes, and what precise variations occar in the mechanism of fertilisation, we do not know ; growers might, with advantage, record what take place here, and who are the visitants. This matter is not merely one for the
physiologist or botanist, it is of direot praotical importance also. A curious illustration of this fact is given us by Messrs. Wallace, who find that one particular form, C. venustus var. oitrina is injured by a leaf-outter bee. The insect destroys nearly all the flowers of this variety, and, to a less extent, those of the similarlycoloured C. lateas. Why the insect should thas manifest a preference for yellow, and take no heed of flowers of other coloar, is a mystery to be solved. Messrs. Wallack ask for a remedy, but short of oovering the flowers with a net, which would be very objectionable, we do not see how the enemy is to be oircumvented.

Calochortus differs from Tulips or Lilies, though allied to both. On handling the bulbs for the first time, one marvels most of all at the prodigality of blossoms that keep following each other in rapid sucoession from the tiny bulbs or root-stook. By growing a fair oolleotion of these plants in early, mid-season, and late varieties, these bulbs may be had in succession from April 1 to the ond of July. These bulbs are quite hardy under proper caltural conditions. Planted in oold, wet, or crowded herbaceous borders, where the straggle for life and growth is incessant, and the survival of the strongest only the bitter end of so many brilliant hopes, the Caloohortus might not oome to much. The best plaoe for them is a thoroughly drained, dry border, faoing and also sloping south, and raised 1 foot or so above the surrounding surface. The soil should be compounded of sea-sand, leafmould, and road-grit in about equal proportions. Sandy loam might compensate for the absence of sea-ssand and road-grit, where neither is easily available; but the former is the compost for Calochortus at Colchester.

It is good practioe to take up the bulbs in the month of August, and replant again towards the end of Ootober or the beginning of November. The plants make little foliage, and produoe almost a forest of flowers. They are greatly helped through the blooming season, and espe cially through suoh droughts an we have had this season, by good thorough waterings every alternate day. Many ohoice colleotions of these showy bulbs were exhibited at the Colchester Rose show, containing some of the choicest varieties.

Though most of the earliest had faded at the time of our visit on July 2, the following were among the best in the different sections. Earliest: C. albus, C. amoenus, C. pulohellus. The mid-season bloomers: C. Benthami, C. corruleas elegans, C. lilaoinus, C. Tolmei.

The latest ceotion are the tallest and the most show, the flower-stems rising to a height of 2 feet in some of the varieties, one floweratem showing a dozen or more blooms, some, suoh as one of the largest venustas oculatus being 4 inches across the cup. The following, among others, were beautifully in bloom in Messrs. Wallack's nursery on Jaly 2:-C. lateus, C. I. ooncolor, C. splendens atroviolaceus, venustus ooulatus, v. oitrinus, v. parparasoens, v. rosens, V . vesta,

Messrs. Wallack sam up the cultaral procedures best adapted for these plants as follows: -" Garly planting [in September, Ootober] to a depth of 3 inches in a light porous soil, sunny position, protection from heavy winter-rains, but no ooddling, plenty of water whilat in full growth, and thorough ripening of the balbs either by taking them ap or by placing lights over them." We should be glad to hear the experience of those who have cultivated the plants in pots.

The following notes on the flowers submitted
to us may serve to oonvey some notion of the colouring of the varieties, though nothing but a well-eresuted coloured illustration can suffice to conver any adequate idea of their beauty:-
"C. splendens atroviolaceus."-Flowers upwards of 3 inchea acrom. Sepals linear-lanceolate acuminate; potala pale lavender, with a small purple blotch a the very base, elsewhere self-coloured, thinly beset with white hairs; filamenta deep violet, ovary glancous, pale violet.
"C. citrinus."-Flowers upward of 3 inchen acrosi ; sepal oblong-acuminate aristate, greeniah externally, with a amall eye-spot in the centre of the inner arface; petais canary-yellow, with a median parplish-brown aquarish blotch; claw with numerous fine radiating linear spota, and a central crencentic band of orange hairs pointing downwarde ; stamen yellowish; ovary green.
C. luteus."-Fiowers upwards of $2 \frac{1}{2}$ inchas acrom Sopals oblong, tapering acuminate, green, convex ex ternally, yellowiah internally, with a fow purplish brown atreake and lines ; petala canary-yellow, with no blotch, bat nameroas amall radisting parplish linen in the centre, and a broad crescentic tuft of orange hairs pointing downwards; flamente and ovary yellowiah.
"C. oculatus."-Flowers upwards of 4 inches acronn. Sepale broadly oblong acuminate, greenish internally, with a central purplish-brown apot edged with canaryyellow; petala creamy-yellow with a central blotch as in the sepala, but larger, claw with numerons minute radiating purpliah lines or apote, and provided with a creacentic band of orange-brown haira; atamens cream-coloured; ovary glaucous.
"C. venustus pictus."-Flowers apwards of 4 inches acrone, epaln recurved acaminate, aristate, apoted and blotched on the inner aurface. Petaln creamywhite, blotch irregularly wedge-shaped, reddichbrown, aurrounded by a thin band of pale yellow, claw with reddish-brown apote and hairn, and a central circular pit. Stamens pale pink, Ovary greenith.
"C. Vesta."-Flowers upwarde of 4 incher acroma, sepale broadly oblong, aristate-acuminate, recurved, greenish, finely spotted on the inner surface; petale pale lavender, with a central reddish-brown, square blotch, surrounded by a halo of yellow, claw marked with minute reddish spots, and with a ring of gold and brown hairs midway between the blotch and the bud. Filaments and anthern cream-coloured. Orary glaucoun, pinkish.
"C. roseuss."-Flowers upwards of 3 inches acrom Sepala green, oblong, acuminate, aristate, with s amall purplish blotch within at the base; petall cream-coloured, with two oblong blotches, one above the other in the middle line, the apper pale, the lower rich chentnut-brown; claw with a central aqurish pad of yellowish hairs, and numerous fine reddish-brown radiating atreaks; anthern and ovary pale.

## Prolessor <br> Huxley.

The death of Professor Huxiri most industrions, persevering, and olear-headed students of science and philosophy in our times. His work is remarkable, not only for quantity and diversity but also for excellence. Theseare qualifications which will be best appraised by his colleagues, but his lucidity of exposition, his disinterestedness, directness of purpose, and we are afraid we must say his pugnacity, gained him the ear of the pablic. It is as the great apostle of Darwinism or rather of "evolution," that he is best known. Darwin himself was the most modest and retiring of men, shrinking from publicity, averse from controversy, and considerate to his opponents to a fault. Such a man was considered "fair game" for the wielders of ridicule, and an excellent target for the heavy artil lery of those who, eminent in their own department, considered that they should have the monopoly of orthodory in matters of natursl science also. Understanding nothing of the
subject, except at second - hand, fearful of assaalts that would never have been made, they assailed the athor of the Origin of Species and his book with a virulence and one-sidedness which seem unacoountable to the generation which has grown op since and takes the general principle of evolution as a " working bypothesis" as a matter of course. For the condition of things that existed at the time, Huxlry was just the right man. Generally well read in science, literature, and philosophy, exceptionally familiar with the details of his subject, clear in logic, incisive

DENDROBIUM $\times$ ILLUSTRE (chryeotoxamp. Dalhouaieanam (). - Even so far as can be jadged by its firt inflorescence, secured after something like ten jeart carefal tending, in this showy bybrid we have a remarkable instance of the good work of the hybridist in producing new garden plante. The apecies cronsed are an diasimilar as they can well be, and have little in common, except that they both inhabit Barmese territory. D. Dalhounieanum was first introduced in 18s7. and D. chrysotoxam eome ten years later. The former has tall terete ateme, leafy when young, and the latter clavate pueudo-bulbs, bearing a few leaves at the top, and jet in Mears. Veitcr's bybrid the smalgama-
lip being parple. It is a remarkably interesting and beautifal plant now; when it wat exhibited by Measin. Jas. Veitcre \& Sos at the meeting of the Orchid Committee of the Royal Horticaltaral Society, June 25, it received a Firat-clana Certificate.

Royal horticultural Society.-The next meeting of the Ryal Horticultaral Society will be held in the Drill Hall, Jamee Street, Victoria Street, Weatminajer, on Taeedny, Jaly 9, when a special show of Roses will be an attractive feature. At 3 o'cloct, Mr. Francrs Darwis will deliver a lecture on "The effecte of Darknese on the forme of plants."

Fig. 4.-dendrobitu $\times$ rllustar: flowers yellow; hip purple
in speeoh, he rushed into the fray, and the railers and vituperators soon found they had an antagonist who could, when neoessary, use their own weapons with overpowering efficiency. One may regret that each party did not keep to its own department, and we must deplore the unscientific temper that was manifested, but we must remember the provocation, and bear in mind that the means used were at the time the only ones that could be appreoiated.

HUxley, though a nataralist in the broad sense of the term, contribated little to botanical, and nothing to horticultaral literature. His paper on Gentians, in the Journal of the Linnean Society, is anggeative rather than practioal.
tion of the two in diatinctly traceable, the awollen atems and fleshier leave indicating D. chryootoxum, while the way in which the leaves are borne, and the characteristic light line on the aheath covering the atems, point as concluaively to D. Dalhousieanum. The flowert also in form merge the two parents, and it will not be too much to may that es D. Dalhousieanum often has tea or twolve flowers on a spike, and D. chrytotoxum often two dozen, sufficiently fine inflorescence, wo far at number of flowere go, may be expected from the hybrid on ite gaining atrength. A curioas circumstance in the resemblance in some particulars which D. $x$ illatre bears to D. albo-annguineum, although its flowers are thicker in substance, and of a clear, shining atraw-yellow, the markings on the downy

Floral Decoratione at Windeor CastleAe belte the reaidence of royalty, on the occasion of a visit from a foreign potentate whom Her Majenty wishe to honour, the art of the gardener is nearly alway called in to aid in imparting an appearance of gaiety to the rich appointments and furnishing of the State apartments at the Cattle. And such was the case when, on Her Majenty's reception of the Searzada on Taenday last, we had the pleamare of inspecting the floral decorations. Mr. Owes Thomas, the ruyal gardener, hae a good eye for effect, and whilet not atriving in the least after eccentricity in arrangement, $s$ is the habit of some, he attain very aatiafactory reault by the use of a few apecien of plante and flowern inatend of a maltiplicity, and by the avoidance of any urdue crowding.

The general scheme of arrangement war one precisely adapted, an regarded some parts of it, to the nummer season, namely, to fill up the fireplaces with planta, to flank all doorway with amall groups, and make assemblages of plants in apaces that admit of its being done by their remoteness from the cuatomary lines of traffic through the various aloons. The only departure from these ideat wat that remarked in St. George's Hall, which will be noted farther on. The grand ataircase, with its white marble statae of Gzorge IV., and bronza figures of naiade, wan beautified by a group of tall Palome, atanding apart from, and a little lower than the statae, the foreground being filled in with Codirame (Crotons), which have foliage with yellow coloura predominatiag, anch being conaidered more cheerfal-looking in the balf-light than the richer-coloured varietien. Other plants consisted of pink Hydrangeas, yellowflowered Margueriter, Liliam longiforum, and beaides these a finishing of Adiantam, Panicum variegatum, and the like. Spray of the variegatedleafed Lonicera and Ivies possessing small foliage hang down over the solid, low walls of the staircase; and on the top of them were disposed Hydrangear, Cape Pelargoniams, more yellow-Howered Margaerites, and the seldom-ased Hamea elegana, pro-fasely-flowered spraya or plants of Rona FálicitéPerfétue, clothing the amall pillars, which gave a finish to the head of the atairs. The wall behind was slightly masked by alender Palms, as far as regarded the large bare epaces between the lancetthaped windows. Small groupa were diaposed on either hand a little further on under the arch, beneath which is the aoproach to the ante-room. In this room the large fauteuil was topped with a cluster of gay-coloured Caladiams of moderate nize, surmounted by a nice apecimen of Pandanus Veitchi. A doorway wae here maoked by a fine piece of Alocania metallica, nome Palmar, Codiæums, and Kalonanthen coccinea, with a bordering of Pilea muscona, Ferns, Solaginella denticulata, Isolepis, and other dwarf plants. The veatibule leading from this to the next one-Nelson's room, so called from a white marble buat of the hero perched on a piece of a mast of the Victory, was flanked on each side of the two doorn with Palms, and a few flowering plants of a kind to afficiently light up the rather darkened place. An imposing group, consiating of Liliep, Kalonanthen, Marguerites, and Codixams, filled the fireplace in the Nelvon-room, and a amaller group was arranged on the opposite wide. St. George's Hall is entered from this laut apartment, and is lighted by eleven very high windowa, all on one side. In each window was hung a banket of cut flowers of one variety, the bakets being literally covered in every part with them; and the flower-long apray and apikesconsisted of a white variety of Intermediate Stock (epridg-kown, an Mr. Thowas remarked); Caneia corymbona, the only yellow flowere employed for thia purpone; Sweet Pea Her Majenty, a deep pink, proface-flowering variety, which filled five of the baskets, and the stocks also five. The windowseate were filled up with much the same kind of material as that previouly noted, with the addition of Glozinias, Hydranger paniculata, the white blownom and graceful habit of which render it an almont ideal plant for indoor nae; Spirea Aruncus and 8. Bumalda, Dracenas with coloured leaves, Francon ramona, Gladiolus The Bride, with Fern, Iwolepis, \&c., as a finish, A group of Palmp, Codimams, Dracæoas, and miscellaneous abbjectim made an effective filling for the enormon fire-place, which finds a place on the side of the Hall opposite the windowe. Some tall, slender Palme at a doorway, and fanking the throne, completed the deaign of the decorations. A capital method of showing off the flowering sprays of Bougaiavillea was retoarked, which being new to up, may be denerving of mention. A Kentia or some auch apecies of Palm about 5 feet in height is selected, and into the axil of each leaf a long flowering shoot of Boagainvillea spectabilis is etuck, the whole forming a very pretty hind of floral fountaic.

The Gardeners' Royal Benevolent InstiTUTION. -The fifty-nixth anniverary featival dinner of the Gardeners' Royal Benevolent Intitation took place on the evening of Friday, Jane 28, in the Whitehall Rooms of the Hôtel Métropole. The Dake of FiFB presided, and the nomerous company included Sir Trevor Lawrence, Preaident of the Royal Horticultaral Society; and Mesars. G. A. Dickson, N. N. Sherwood, W. Gibbs, T. Ellis, Ed. Siern, G. J. Brackenridge, David Syme, G. Monro, Jan, Webber, T. F. Peacock, F.S.A; G. W. Dawes, W. J. Jeffries, E. W. Cathie, G. Bighop, \&ce. In proposing the toast of "Continued Saccens to the Inatitution," the Chairman aid that in thene days, in apite of universal depression, enormons sums were apent every year in charity, and last year in London alone there was disbursed by the different societies and agencies which existed for the parpose no less a nam than $£ 5,200,000$, to ay nothing of the very considerable am which coald not be calcalated that flowed along the hidden channels of private benevolence. Bat, nafortanately, these hage sums did not bring about the beneficial reaulta which we all desired, because there was not sufficient concentration in charitable effort, and becanse there were too many mocieties doing the ame or similar work. His remarks, bowever, did not apply to the Gardeners' Benevolent Institation, for it was, he belheved, the only society of its kind in Great Britain. Its principal object was to asaist the aged and infirm by means of pensions, and it incalcated the admirable principle of self-help by giving preference to those who had sabscribed to its funde. Now-adays it seemed as if all parties in the State had agreed to do that which was regarded as tneroughly uasound by the old Whig achool in which be was brought ap, namely, to establish a syatem of Stateaided pensions. But the Gardeners' Bonevolent Iastitution had been doing for many years for the gardeners what the State now proposed to do for everybody. The life of a gardener was not entirely a bed of Rozes. Many had to toil unceasingly at all timen of the year, and in all weathers, and the result of their toil was to provide as with some of Natare's choicest gifts. Bat misfortane sometimes overtook them, and it was to meet cases of this kind that that Institution was eatablished nearly sixty years ago. Since then penaions and grataities had been granted to the amount of $£ 65000$, and at the present moment 156 persons were receiving the zasistance of the Society, 77 of them being men, and 79 women, while there were manay pressing cases on the list waiting for e'ection. The toast, which was heartily received, was reaponded to by Mr. G. A. Drekson of Chester. Mr. W. J. Jeffries of Cirancester gave the toast of "Horticulture," which was acknowledged by Sir Trevja Lawrence. The Sacretary, Mr. G. J. Ingrair, having annoanced sabscriptions amoanting to nver $£ 1900$, including $£ 30$ from the Dake of $\mathrm{Fifg}_{\mathrm{I}} \mathrm{£} 105 \mathrm{from}$ Messis. Rothscmild, 10 guineas from Alfard de Rothschild, Esq.; and $£ 10$ from the Hoo. Walter Rothschild, $\pm$ '2l from N. Sherwood, Enq, and £25 from Mesars. Jamis Veitch \& Soss; the proceedings closed with the toant of "The Chairman," proposed by Mr. N. Surswood. The Dake of Westurnster has increased his annual nabacription to the Iastitation, of which he is President, to $£ 1515 \mathrm{~s}$.

Univergity College, London. - On the evening of the 27 th alt, the President and staff of this Institution gave a largely attended aad brilliant conversazione. The scientific and engineering departmente of the College, and the Slade achool of fine arts were all in gala array. The department of botany was well to the fore, and its exhibits included saperb collections of plants from well-known growers. Mesers. Jaikes Veitch \& Sow eent an interesting collection of infectivorou plante, hybrid Orchide, and other plants. The hybride, being grouped with their parent forms, made a particularly intereating exhibit. Mesert. Wx. Paut \& Son had a fine diplay of Rosen in the soath cloister, the fleshcoloured Clio, Dake of York, Hon. Edith Gifford, and the yellow Medea being particularly admired. A large
collection of Cactaceæ and other ucculent: did fall juatice to Mearrs. Henry Cannell \& Sons; whilat Meaors. B. S. Williams \& Son and Mr. T. S. Warb both sent attractive and well-selected exhibits. In the botanical laboratory was a group of portraits of former members of the botanical staff, including a large crayon portrait of the late Prof. John Lindiky (lent by his an Lord Justice Lindlex), a head in oils of Professor D. Oliver, and photographs of Professor F. O. Bower, Dr. D. H. Scott, the Rev. George Henslow, Profensor F. E. Weiss, and othera. Here also was a selection of old Hower-drawinga by Ehret and Madame Meatan, large photographe of forest vegetation (lent by Dr. D. Morris, Ansiatant Director, Roya! Gardens, Kew), and photographa of plants at Kew, by Mr. F. A. Bridae. Oa the tablen were exhibits of physiological interest, and a few alides of fossil plants from the collection of the late Professor W.C. Wilciamson. Of apecial note were the large models of dividing cell-nuclei exhibited by Profesaor J. B. Fariler; they are likely to be of great help to the stadent of minate cell histology. The laboratory had been very skilfally decorated by the lady atadents of the department, and the banks of flowers which they had arranged, and which were illaminated by the electric light, were singularly effective, as also was a tank of white and yellow Water-Lilies. A neries of living Seaweeds and other aquatic plants, shown as transparencies by this department were much admired, Ulva, Laminaria, Cladophora, and Utricalaria, were perhaps the most beaatiful. Other botanical exhibits incladed phosograph and tables illustrating the fixation of free nitrogen (lent by Sir Henry Gilbert, F.R.S.) plant akeletona, by Mrs. Hodakinson; and artificiallycoloured flowers, by Wm. Brocíbank, Eeq., F.L.S. In the Slade achool we noted an effective combination of flowers, stataary, and Chinese lanterns; and in the phyaical lecture-room, Argon and Heliam, the main output of the chemical department of the college during the session, were on view. The soirée was attended by several thounand gresta, including many well known in literary and scientific circlen.

ROYAL BOTANIC SOCIETY.-At a meeting of the council of this aciety, held on Saturday lant, it was decided to open their gardens in Regent's Park to the pablic on every Monday in July, August, and September, at an admission fee of 18 .

An Outing of the National Amateur Gardeners' Association,--On Saturday, June 22, in response to an invitation from H. Hocks Gibes, Esq., opwards of 150 members of the National Amateur Gardeners' Association paid a visit to Aldenham Honse, Herts, for the purpose of ingpecting the gardens. The headquarters of this Society are in London, and meetinga are held the first Tuesday in every month at the Memorial Hall, Farringdon Street. In order to promote the objecte the Society have at heart, visits are made during the pring and nommer months to various gardens and nurweries. The parent Society number between 400 and 500 members, beaides branches in different parts of the country. The visitora, amung whom were a number of ladies, were met on their arrival by Mr. Beckett, the head gardener at Aldenham, and nomesmateurs resident in the neighbourhood, and conducted by him round the lovely gardens.

Herbaceous Plants.-Now that thene are in full meason, we haaten to announce the pablication of a Hand List of herbaceous plants cultivated in the Royal Gardens, Kew. We must defer further notice, but may mention that it may be obtained at the Royal Gardens, Kgw, at the cost of one willing.

The newcastle-on- Tyne Horticultural SOCIETY. -The sammer nhow of thin society will be held in the Recreation Ground, North Road, on Wedneaday, Thuraday, and Friday, 24th, 2Jth, and 26 th inst. This year additional prizes are offered for groupa, dinner-table, and fireplace decorations, and also for vegetables. The council are also prepared, as we are informed, to give increased facilitien to attractive tráde atands.

The royal Gardeners' osphan Fund.The monthly meeting of the cromitipe took place et the Horticultaral Clab oa tha 27 th alt., W. Marshall, Esq, preaiding. The fo lowing special donations were simouncent: - From the William Thoman Mamorial Fund, $£^{\prime} 5513 \mathrm{~s}$. $2 d$; Mr. J. T. Anderenn, R. I. Mesaure. Esq. proceeds of skle of ebird edition

Cypripediam. Hybrid Species," £T 10.; and Mr. A. Stirton, Wrexham, 5s. A cheque was drawn for the children's quarterly allowances, which now smount to $£ 2 \mathrm{OH} 10 \mathrm{~s}$; and the gardeners about the couatry who do not yet subscribe to the Fand or sapport it in any way should make a note of the face that so large a amo is paid annually to asnist in the mainenance of the orphan children of dead gardegers.

The Oriain of the Cineraria. - We have som, farther remerk to make on this subject, bat defer them for the present. In the meantime, we observe that our colleague The Gardeners Magazine "conclunively prove " [co his own satisfaction] that the evidence in favoar of bybridity will not bear examination. An important statement of fact from Mr. Kelway ia pablished in the ame joarnal, to the pffect that be. Mr. Kelway, raized the florist' Cineraria in 1837 . by election from seedling of C . cruenta. If the records are to be relied on, thil is ten years after Drommond's experimente, but this, of course, doe not inpalidate Mr. Kelway's statement. We shall also have to refer later on to the alleged hybrid that have appeared in the Cambridge Botanic Garded, and in that of $\mathrm{M}_{\mathrm{r}}$. Poer.
M. Rodigas - Sjme of the Bilgian paper givo fall detaile concarning the compliments paid to M . Eurice Rodigas, the Director of the Schoal of Horticulcare at Ghent, on the occasion of his completing thirty-five yeara as a professor. Many of us in this country are also familiap with the unceasing labours of M. Rodigas, his accaracy of perception, his impartiality, his powers as an administrator, and some of us are fortanate enough to reckon him an a personal friand. MM. Borvenice, Pynaert, Rodians, and Van Hucle, conatitute the "four-leaved Trefoil," a body to whose joiat effurt for more than thirty yeara no amall part of the progrese of Balgian horticalture is due. The talk of this foar-leaved anity is Count De Kerceove de Draterahem Floreat semper diuque foreant.

National Horticultural Society of France.-A: the lat meeting of the Orchid Committee of the National Horticultural Society of France, Mr. Jacob, Orchid Foreman to the Baron Ed. de Roxaschild, Armainvilliers, showed a magnificent groap of new hybrid Cattleyas. I noticad amonget them a particalarly interenting plant, Cattleya Armainvillea slba (C. Meadeli $\times C$. Rigas), potals and sepals lurge, pure white; lip broadly opan, crimson; pare gold yellow at the bate. Another plant of the same crom had the divaion slightly flathed with clear row. A pleadid thing is Lax'io-Cittleya Jacobisna (Lalia parpurata $\times$ Cattleya Mandeli), the division of the flower white, tinged with rosy-mave colour; the front lobe of the lip dark crimson-parple, and the base nearly white. A fae Lalio Cattleya Canhamiana, raised from I。. parpurata $\times$ C. Mossiæ, was shown the parentage is certain, and the plant is exsctly the mame as the one obtained at Mesury. Visitci \& Sons Mr. Page, gardener to Mr. Lebsudx, Boagival, exhibited a very hadsome new hybrid Uypripedium; the parents are C . Berizatum and C . Haynaldianum, and the plant which remblem C. Parishii, received the name of C. Labaudyanum: cape with six flowera each having it dorsal wepal emerald-green at the base, vertically atreakpd with brown; petals twitting, pale green at the base, and vinous-parple at their extrenoity; the whitish inferior wepal in very large and arched. Thin plant received a first-class certificate, Georges Truffunt.

The Late M. J. E. Bommer.-We have received a biographical notice by Prof. Leo Eresra of the
late J. E. Bosmer, whose name is well krown in connection with his monographs on Forne. M. Bommer, it will be remembered, was a native of Brumels, and hia death took place last February.

## Home Correspondenoe

THE BTRAWBERRY, SENBATION.-This Strawberry has tarned out well with as thit season. Pisated on a border by the side of Noble, it has ripened it fruit an early an that variety, and the frait is very much fiser in appearance, and of better favour than that variety. What its merits may be for pot-work I cannot say, but I intend to give it a trial nexp seamon. If we coald only get some of the Britioh Queen Glavour in the large early Scrawberrifs, what an acquinition it would be! W. S. Hurlstone.
bamboos and the pabt wintern-Mr. Beani instractive paper on the subject of $B$ amboos and the past wiater, is most interesting. His cooclasions are fully borne out by our experience here. As regard Canon Ellacombe's angeation, that the severe winter has actually been of service to his Bamboos, I ahould rather be of opinion that the great bhoote to which he alludes are due to the wet summer of 1834, which greatly encouraged sootaction, and, consequently, the stem-bud which are formed on the rhizomes. Tasan-chilee, which he mentions an being killed, is not hardy, and woald die in any ordinary Eaglish winter. It is supposed not to be a native Japanese plant, but a degenerate form of one of the giant tropical Bamboos, partially acclimatised in Japan, bat doomed to certain death here. Its position in Japan would be analogous to that of the Japanese and Chinese Bamboo in this country. We can grow them, bat in a dwarfed form; and if they were to be carried to a atill more unfavourable climate, thay would parish altogether. A. T. Fraun Mitford, Batsford Park, Moreton in-

THE CINERARIA. - As anthentic records are wanting apon the early history of the aubject, a few experiment ought to be made with the view of avcertaining the value of the two conjectures. If it originated by the crossing of cruenta and lanata, it was evidently not denigned, and it may be waid that our greenhouse Cinerarias came by chance. A fow plant of Cineraria cruenta when in flower shonld be isolated, 0 at to make nure againat their becoming pollinated with other Cinerarias; seeds should be saved from mach a stock, the need nown, and the plants when in flower carefally examined for variations. Then a few plants of Cineraria craenta might be pollianted with the pollen of Cine. raria lanata, and vice versá, saving the seeds, and raising plants from them, and watching the results. As far as my experience goen, the seede of Cineraria cruenta ars not abortive, as is stated in the Botanical Magazine, for a plant which was in flower in thene gardens a short time ago has prodaced several seedlinge, many having aprung up from the aurface of the soil of the pot in which it was grown, also from the seed. gathered from the plant. And I can endore Mr. Drammond's remark, that "the flower retain their beauty until the very day the seeds are cattered." It may be that oar plant had become pollinated by the floriata' Cinerarias, which were in bloom at the ame time as C. cruenta. These aeedlings from C. cruenta which we bave will be watched with interest, to note whether any variation takes place from the parent plant, and I will send you a note apan the subject in due season. Mr. Duagla: has expressed a wiah for a plant of C. cruenta and C. lanata. I hall be pleased to send him a plant of the latter and two or three seedling of the former for experimenting apon. if he is not already sapplied. Win Harrow, Botanical and Horticultural Society's Garden, Sheffield.
cedar of lebanon at Tapley.-The height of this tree is about 50 feet. It top is large and flat. It was planted in 1825. W. T. T.

RED WATER. - I have in my garden a wall poad of about 500 quare yarde area, with an average depth of about 2 feet. It is contained in a cemented basin, and is applied by means of a hydraulic ram from a deep apring a quarter of a mile diatant, the water of which in enpecially pare and bright. In each spring time for nome yeara pasf the water of this pond han turned a deep blood-red coloar, in

Which atate it remain for some monthe, and then it appear that the colour is dae to namberlest red coloured organiome, which. sccording to Prantl and Vises, are relerable to Hamatococcas. I do not know whetber this red water is often seen and well known, but as it ia very ansightly, I should beextremely obliged to anyone who would tell me if there be any mean of destroying the growth, or of preventiog ite recurrence. S. Courtauld, Bocking Place, Junc 26.

8Quirrels. - The note of 1)r. Morrie regarding the iujury to acariet Chestants by thee aprightly hittle thieves is very interesting. I have known them injure the thoote of the Scotch Fir in the anme way: here they eat the green cones of that tree by handrede, but fortunately they do not iojare the trees. Ineir power of adapting themselven to altered circumatances is m extraordinary. I believe they diaposed of at leat a buehel or two of my Parsnips during the lat winter, and now they eat my Strawberriea by wholesale and bite the nets to pieces. Last aeaon Applen and Plums were annexed in large quantitie. Daring the winter one little fellow came regularly evary morning on to the all of my breakfat-room window. If gave us great pleasure to see him ait and manch up pieces of bread which were provided for him. The mont extraordinary freak I bave ever heard of squirrels in the following: I bave a bell to ammon $m$ workmen, which is hang in a little cage about 15 or 20 feet high. The other day, when the time came for ringing the bell, a squirrel was found sitting by the bell, his mouth full of frayed hemp, and the rope bitten in two. We presume he found the soft hemp suitable for lining his neat, and my bellman bad to climb up to fix another rope. Query: Did the equirsel find the rope frayed, or did he manufacuare a soft wadding from the rope? Charles Noble.

HEAVY THUNDERBTORM.-A thort note of what happened at Edge last week may intereat some of your readers. At 4 P.M. on Jane 26 a thanderatorm suddenly collected in the sky after a brilliant and scorching day. About a thousand flashes of lightning, all within five or mix miles, occurred in an hour, during which I eatimated that nearly 2 inches of rain fell. At one time I counted over thirty flames in a minute. Toirteen large treen-there may be more yet to be discovered-were atrack within about half a mile of my house, twalve Oak and one Ath, aix of thase were within 300 yarde of the house. At five o'clock the torm had all passed over. The next day, June 27 , at balf-pasi twelve, we had another sharp thunderstorm, lasting an hour, e fall of large hail, lasting twenty minutes, completely demolished every open flower in the garden, and many of the plants. The Rhabarb leaver are a curious sight, looking as if they had been used for rifle targete. A few cattle were killed in the neighbourhood, but, a far as I have heard, no human boing*. C. Wolley Dod, Edge Hall, Malpas, June 29.
gTORM IN YOAKBHIRE. -The atorm of Juae 26 was the worst the oldeat man in Mirield could remember. The hail was as big an marbles, and in mogarden of nearly 2 acres in extent, Peas, Beans, Strawberries, Rupberries, and all vegetablef, flowert, and everything else, were completely destroyed, and rearly every pane of glase in the house wan broken. I am by no means the only one who has nuffered, but when man is depending on hi garden. it is a serious thing. D. Brown, Nab Nurseries, Batiyeford, Mirfield.

VICOMTESBE HERICART DE THURY BTRAW BERRY.-The engraving, p. 775, well reprenent this fine variety at ita best. This variety was a favourite with Mr. Wildmith, of Heckfield Place, for early forcing, and none conld he obtain that wai better for ripening in the middle of February-in fact, he regarded it as being the bent Strawbarry for forcing or ont of doors. It fiavour is excellont, and in thi respect it it only second to Britich Queen. It is a aplendid cropper, bat unfitted for market, the berrie being mallioh, and ite favour does not make up for it want of size. About Liverpool the Vicontense way alway a favourite variety, it going there ander the name of Garibaldi. So little is it known out of private gardens that in this dietrict, where at leat 1000 acres are devoted to Strawberry caltare, I do not know a aingle inatance of itw being grown for market. It in a very free grower, and a very hardy planc, with ample foliage, which in chort-atalked, if the bulk of the old leave are removed when fruiting is over. $E_{s} M_{\text {. }}$

## national rose exhibition at GLOUCESTER

## Junir 2\%.-This was a most accenfal meetiog

 In almost all clases the competition was numeroa, and in many it was exceptionally cloes. The Mayor accompanied by the sheriff and weveral of the council, nito the Maror of Cheltenham, opened the show. Good as Windeor was last season, the presentamong these after the most prifeot apecimen, Comtense do Ludre, Was removed. Mr. B. R. Cast, Colchester, was Do Dufferin, Comtese de Nadaillac. 8 . M. Rodocinachi - Ear Williama, Her Majenty, Caroline Testout, La France, Dupuy Jamain, a od Lady Mary Fuzwilliam.
seven competed in a chas for twenty-four singles, Mesart Townshusil \& Sow. Worceater, wianing with a good stand nmong their best flowers being Rubens, Marie Bady. Charles Iufnuvre, and Gugtave Piganneau; the 20d prize ctand, from In marn. Coourxi \& Boxs. Bath, was larger, bat not so well ormed.
The strongest clas was that for twenty-four varieties, three trusees of each, ten competing with remarkably close stands. Messrs. R. H\&Hh NEsh \& Sons were lst, showing in suparb form: Mr. B. K. CaNt, Colchester, was place 1 zad, his lot ubing particalarly bright and clean, but maller.
Mr. B. R. Camt, Colcheater, was well in frost for twelve uingles of any H.-P. Rooe, and etaged - doren beautifal Lady Mary Fitzwilliaza: Mesme. Townsiemd sons, Worcester 2nd, with Mro. J. Laing.

There wat a very utrong and cione competition in an extrin lam for twelve niagle tromes, open to all umateurs irrespec live of the pumber of plant grown. The Rev. J. H. PEM BERTos, Havenigeatte BJwer, waw lit with a rood otand V'Irch Brunser. Gabrielle Luizet. Horace Vernet (a grana liooms), Marre Bumann, Rarl of Dufferin. Gustave Pigameau. Acc. Mr. K. H. Lindmell., Hitchin, a cloee 2nd, had youdger liwern, and in all prombality a couple of hours later in ulding would have seen these iwo redoubtable growerm in reverme pomitons. Some mintun or meventeen lot were staged. A clans 'os twenty-four dinfloct, muklen, wan also pery atrong,
 ia:ned a bloon markel i. cuecter " but ahich way far too noarly ble Marie Raty in every reaper?. Il was a good bloom. Othere that demerve mention were Ionocente Mirol Marie Vierdier, S.-M. Rodocmachi, ant Her Mrjaty. Mr. E. B. LiNIMLLL. Hitchos, wan 20d with remarkably gool example of Comse Rammliaud, whise Hep Mijsty. Ihake of Welliagton. Marie Baumand, and Horace Vernet were also grand.
A clam of enghteen siogle crumes. dintinct, open only to prowers of lem that 2000 plante of reoggaited exhibition "arietion, found Mr. J. Pamere, Hitchin, good let. His bent blooms were La Irames, Gibrielle Luizet, Innocente Pirola, and Ducheme de Vallombrome Mr. K. Kawley. Rerkhameted, wim Ind, and bel Hurace Veraet ia eplendid ondition.
In a clan of mix distibct, three hiom of each, sleven comrelitorn lupded up. Mr. E B Livragels, Hitchía, wan let having very bonghe and cleap flowern. Mr. WALTERENW, Ledbury, made a rood 2my

## 

Open elew, irmepperive of number of planti, for eichbew distiact, miaple krimen, menes rery ewodient ownoln were put up. Mr. O. G. Omrme. Collh ster, wionien with rred flowere of Cleopatre, Madawe H. Jsmav, Iren ewer Krumor. Madame Cusin, Marchat Niel. Sourenit d'sn Ams, and Madawe de
 Metuan eproghtoa terbery, Ipwich, was but little behind.

In a class of six sing'e, for growers of leas than 500 plants, Mr. G. MovLes, Hitchin, was a capital list; Mr. B. F. Hobes, Worcester, 2nd.
An extra class of six trebles, open to all amatears, was won oy the Rev. A. Foster Melliar. Ippwich; Mr. Conway Joses. Hucleton, was 2nd. Six truses of any Tea or
Noisette, Souvenir d'Elise Vardou woa here for the Rev. Noisette, Souvenir d'Elise Vardou woa here for the Revo
Foster-Meluin ; while 2nd was taken by Edith Gifford, for Foster-Mellilir; while
the Rev. F. R. Buryside.

## Open Classes.

For twelve varieties, three of each, some of the grandest Teas we haviseen were put up. Mr. B. R. CANT, Collehester, being het, with La Boole a'Or, Mada me Cusin, Innocente Pirols, Madame de Watteville, Edith Giftord, and Ernest Metz in particularly good form.
Twelve truses of any Tea or Noisette brought a dozen of Marie Van Houtte in its prettiest form, Messrs. D. Phor \& Sow, colchester, taking lst.

## Gardee roses.

These were not quite so extensively thown as usual. In a clase for nureerymen, of thirty-six bunches, distinct, with not fewer than three, nor more than six trusses to a bunch, Mr. C. TURNEB, Slough, was lst, with very pretty trusess of rugocess Crimson Rambler, Persisn Yellow, Moesee, macrantha, Polyantha, Hébés Lip, and Moschata alba a mong many othera. The amateur's classes of these wera good. For eighteen
bunchea, Mr. A. TaTE, Leatherhead, was ist; Marquis of bunches, Mr. A. TaTE, Leatherhead, was Lst; Marquis of
Salisbury, Hebe's Lip, Crested Moss, Gloire de Resmanee, Salisbury, Hebe's Lip, Crested Moss, Gloir
Rosa Mundi, and macrantha were his best.
For six bunches, not open to the exhibitors in the preceding clasees, the Bev. J. H. Pembertox was a capital lot, having as pecaliarly semi-double form of Polyantha, the old Red Provins or Provenoe, multifora simplex, Rose Mundi, acc. Mr. J. OUGG, Hereford, was 2nd.

## Open Classes.

A display of Roses, not to exceed 6 feet by 3 feet, in which any Rose may be shown and arranged to individual taste, was very pretty, but not so striking as several lots we have seen. Mr. H. Whitehend, Heathville Nursery, Gloucester. was lst, with an arrangement of Rose forming the letters N. R. S., ihe society's ivitials. Edith Gifford, Marie Van Houtte, and Lamarque, formed these letter in lire order, while the whole was surrounded with various other Roses, but too formally arranged. We hope this silly practice will not find favour. A good box of Turner's Crimson Ramblep was ineluded hore.
A good box of Turner's Crimson Rambler was included hore.
Three trusees of any new seedling or distinct sport did not provide s startling novelty, Pride of the Valley whe the only one shown, no award being made. It looked far too mach like a pale indifferent Mrw, Jno. Laing.

## Local Classes.

These were good, but the excellent quality and enormons number from other districts, not to mention the fact that the strongest growers also went into higher clases, considerably strongest growers also went
detracted from their beauty.
Mr. Conwax Jonis, Hucclecote, won the Silver Cup for eighteen distinct single truses; and Mr. T. A. Washeounx, Huccleton, was placed 2ad.
Mr. J. F. Fulford won the gilver Medal for twelve narieties: Mr. Gakbikr Pabry was 2nd.
A Challenge Plate, presented by the Rev. F. R. Buanside, for twelve Teas or Noisettes, went to Mr. T. A. Whshbourn: Mr. R. C. Hoptow being 2nd.
Mr. Conway Jones also won the Silver Medal for six Teas of Noisettes, Mr. T. ThorPE, Hilldrop, near Oloucester, tahing a similar honour for twelve trusaes; while the lat for ix singles was won by Mr. G. Phatt, 39, Park End Road.
The Corporation of Gloucester presented a silver salver for twelve distinct singles, which was won by Mr. Cowwar Jones; the 2nd went to Mr. C. Brown, Saint's Bridge House.
A ailver medal for twelve singlen, grown by cottagers, wa presented by T. THoRPR, EMT., and won by Mr, E. C. Hopros, Hucelecote. Eor nix singlew, Mr. J. MrDDrcotr, Malson: Mr. F. Bincerer, Hucclecote; and Mr. A. Micazli, Coney Hill, woa in like order.
A broaze medal and money was woa by Mr. E. Pooks, Upton, 8t. Leonarde.
Among the cottagers, Mr. F. W. Bolvow had the bent angle
truw in Mrs. Joo. Laing.

## SLlVEB-MDAL ROSES.

The Bilver Modal for the best hybrid perpetual in the nurserymen clasees, whe warded to Mescrs. HinK FEss \& Sows, for Comteme de Ladre; that for Teas or Fioisettee going to Mr. F. Caxt, for Ethel Brownlow.

In the amateurg' clasees, Horace Veroet won, for the Rev J. H. Pembertor; and La Boule d'Or for the Rev. FosterMELKAR。
A mood lot of hybrid Sweet Briars eame frome Mesars. Kerwes, WruinMe ac Co., Salisbury, who etaged all the older hiad except Meg Merrilies. They now had wome that aro nat yet in cousmerce, the bot of which is undoubtedly Jeanmie Deuns, a bright and sexi-double variety.

## DEVON AND EXETER HORTICULTURAL.

Juse 28.-The 1814t exhibition of this Society was held on the above date, the day being wet and nofavourable. The summer exhibition is anaally held in Arguat, and it is fifteen years since the latt
thinga, many of the well-known exhibitors having entered, bat only a amall number pat in an appearsnce. This not only caned grest disappoincment, bat also mach inconvenience. Tae quality was generally fine, Tea Roses being excellent.
In the nurserymen's class, for forty-eight distinct, Mesars Curtis, SANFORD \& Co., Torquay, were 1st; and Messrs. D. Prior \& SoN, Colchester, a good 2nd. In the winning exhibit were Ernest Metz, Jean Ducher, Victor Hugo, Maman Cochet, Captain Christy, Xavier Olibo, Madame Cusin, Star of Waltham, Black Princ e, Alfred Colomb, Marie Baumann, and
Suzanne-M. Rodocanachi, the blooms being distinguished for Suzanne-M. Rodocana fine form and colour.
In the tweaty-four distinct, Mr. Joen Mattock, New Headington, Offord, was 1st; Mesers Robert Veitci \& Son, Exeter, 2ad; and Messrs. Jarman \& Co., Chard, 3rd. In the
twenty-four distinct (three trusses of each), M trsers. D. Prior \& Son were 1st; Messir. Curtis, Sanmord \& Co., 2nd. In the winning collection were Souvenir de S. A. Prince, Her Majesty, A. K. Williams, Marie van Houtte, Horace Vernet, and Madame Gabrielle Luizet. In the 2nd lot were Margaret Dickson, The Bride, Jean Ducher, and Innocente Pirola, all very good indeod.
For the eighteen Teas or Noisettes, Messrs. D. Prior \& Son were 1st; Measrs. Curtis, Sanford \& Co., 2nd; and Mr. Join Mattock, 3rd. Messrs. Paior \& Son had gojd examples of Comtesse de Nadaillac, Madame Hoste. Hon. Edith Gifford, Caroline Kuater, Souvenir d'Elise Vardon, Cleopatra, and Marie Van Houtta. Messrs. Curtis, Sanford \& Co. showed a very fine bloom of Souvenir d'un Ami.

In the open classer, Messrs. Prior * Sor were sgain 1st for twenty-four Teas or Noisettes, Mr. J. MatTock 2ad, and A. Hill Gray. Esq., of Bath, 3rd. The prize exhibit had excellent blooms of Madame Lambird, Madame Bravy. The Bridesmaid. Inoocente Pirola, Catherine Mermet, and Marie Van Houtte. The latter was superb in this and several other classes.
For twelve blooms of any light H.-P.'s, Mesirs. Prior a Son were 1st with Her Majesty, as nearly perfection as it is passible to show them. Mr. Walter Drew, Ledbury, came 2nd with the eame variety, a magnificent lot.
For twelve blooms of any dark $\mathbf{H} .-\mathrm{H} . \mathrm{B}$, Mesars. Curtis, Sanford a Co. were well lat with a grand boz of Marie Baumann. R. N. G. BAKER, Esq., of Heavitree, Exeter, 2nd, with a very fine lot of Ulrich Brunner.
A. Hill Gray was let for twelve Maréchal Niel of magnificent colour; and Prior \& Sor took?promier place for twelve of any other Tea or Noisette, with a good box of Caroline Kuster. For sir buaches of garden Roses Mesors. Prior \& Sor were let, and James Jerman, Esq., The Bungalow, Exeter, 2nd.

In the amateur clases, Mr. WALTER DREW took premier honours with thirty-sis fine blooms, among which were Dingée Conard, Marchiones of Londonderry, Marie Finger, C. Teatout, Ulrich Brunner, Caroline Kuster, Thomas Mills, Her Majeaty, and Etoile de Lyon. In this collection, the bloom of Marchionees of Londonderry was awarded the Medal for the best H.P. in the show. R. N. G. BAKER was a good 2nd.

For the twenty-four blooms, B. E. West, Esq.o of Reigate, was let, with a fiae lot ; and A. Hill Gra Y, 3ad.
For twelve sorts, three truses of each, Mr. WALTER DREW Fas lut.
For twelve Teas or Noisetten, A. Hicl Gray had in his winning lot Reine du Portugal. Souvenir de S. A. Prince, Ernest Metz, and Souv. d'Klise Vardon.
Mr. B. N. G. Baker took premier place for six of any one sort of Tea or Noisette, with is fine atand of Princess of Wales. The class for twelve Teas or Noisettes, distinct, three trusses of each. was won by Mr. A. Hill Gray, with a fine lot.
Mr. N. G. BakHR tool honours for the best Tea or Noisette in the mhow, wilh Comteme de Nadaillac.

## Miscellangous Plants and Flowers

In hurdy herbactous flowers, some excellent bunches were shown, particularly fine being a bunch of Thalictrum squilegifoliun. Pelargonium in truees were good, but Pansies very poor, and the lat prize was withheld. Tuchsias and Pelargoniums in pots were fair, eapecielly the latter.
The groups were not at all up to the usual form at the Rzeter Augrat shows, they sadly wanted colour and rariety. The lst prize group, W. Brock, Req. Parkar's Well, Exete (gro. Mr. W, Rowland), was an ensy lat. The twelve Gloziniae, lat prize tor which was awarded to Mri. A. D. SIM, Knowle, Exeter (Kr., Mr. A. Williams), ware vers good indeed.

## Fsula.

Fruit was indifferently shown in most classes, Grapes were fair, Melons uneven, but 8trawberrie were splendid. For Black Grapes other than Hamburghs, Trentham Black was the winning sart, and in White Grapes, Backland 8weetwater. The let in Gooseberries was Golden Drop, but tho competition in these clases wae not reen. The clas for four competitian in these clames wal not keen. The claw for four
divhe of Strawberries was woa by H. Hammond sprscers, Req., Teignmouth (gr., Mr. Eoster), with Senaation, Watirioo, Commander, and Jumos Veitca, all Eret-rate. The two dishes were won with Sir Joeeph Paxton and Preaident, and the one diah clase by Mien Dax. Kenton, with a grand exhibit of Sir Joseph Puxton. Mra. A. D. 81w mhowed a fine dish of Baby Catic Curranta.

## Vegetableg.

In vegotablew, prexier place wae ggain taken by Sir Jour SEELLEY, Barto, High Sheriff of Devon (ge., Mr. B. Mavit). with grad colleation of eight rarieties, comaisting of Veitch's Model Carrst, Dule of Yorl Potato, Gradum Pea,

Veitch's Midsummer Day Caulifower, Veitch's Red Garden Globe Turnip, Perfection Tomato, Veitch's Exhibition Broad Globe Turnip, Perfection Tomat and Canadian Wonder Dwarf Keans. The 2nd prize Beans, and Canadian Wonder Dwarf Heans. The 2nd prize
collection was alco good. Veitch's Perfection, Voitch's Gem, collection was al:o good. Veitch's Perfection, Voitch's Gem,
and Blendworth Perfection Cucumbers were well shown. and Blendworth Perfection Cucumbers were well shown, Garden Globe 'Turnip, Early Puritan Potato, and Mein's No. 1 Cabbage, were prominent among the winning dithes.

## Trade Exaibits.

In the Nurserymen's exhibits were some very good things. By far the largest exhibit was that of Messrs. Robert Veirch \& Sor, who, in addition to a good general collection, showed \& Soy, who, in addition to a good general collection, showed
some new hybrid Water Lilies, a grand box of Carnations, and a rich collection of alpine and roct plants.
Meesrs. Randill \& Son had a good miscellaneous collection, as also had Mr. W. B. Smale, Torquay, this exhibitor showing good Petunias and Double Shirley Poppies, with three Chrysanthemums. Charles Davis flowering out of season. Mr. W.J. Godfrey, Exmouth, had good Carnations, amongst them being Goldmine, Sunrise, and Primroee League. Four new and well-coloured Coleuses were also in this stand, and a good and well-coloured Coleuses were also in this stand, and a good assortment of cut flowers. Mr. J. Walker. Mount Radiord;
Messrs. Jarman \& Co, Chard; Messrs. Beachr \& Co., King's Kerswell, als, exhibited: as did the Jadoo Company, who had a large stand of well-grown specimens, grown in Jadoo from the conservatories of Colonel Halford Thompson.

## WINDSOR, ETON, AND DISTRICT ROSE AND HORTICULTURAL.

Jons 29.-The annual exhibition of this acciety was held on Satarday last in the private grounde of Windsor Castle. Roses were by far the strongest classes, and in the most important of these the quality of the bloocos was excellent. There was not much competition in the plant clanses, and the three tenta that bad been provided were not more than farnished. We would aggent to the committee that on another occasion the names of the exhibitors should be more plainly written. Conaiderable trouble and error might thus be asved the apectators, while it would also be convenient if the addresses of exhibitors were incladed on the cards.

## Roses.

We have alreadysaid that the quality of the Roses was good, and this was particularly the case in the three first open claeses. Mr. Bend. R. CaNT, Colchester, was lst for thirtysix distinct singlo trasees, and the most notionble is hil stand were Ulrich Brunner, Gustave Pigmaneau, Madame $Q$. Luizet, Marchioness of Downshire, White Lady. Lady Mary Fitzwilliam, March oaes of Dufferin, end A. K. Williams. Meast. Harermes \& Bons, Bodale, Yorks, wurt 2nd. Their blooms were smaller, but they were of capital colour and nice in form; Mesars. Priors \& Sons, Calchester, were 3rd in this clens, but won in that for eighteen Tese or Noisettes, in this cimes, but won in that for eighteen Tees or Noisettos, Which included ver
Sonvenir d'un Ami.
The third open clas-three trusees each of twelve distinct varieties-fell to an amateur, and to win he bad to beat splendid blooms from the trade. The Rev. J. H. PFMbeator. Havering-atte-Bower, Aomford. Reoex, had large full blooms, and of excellent colonr; Mesarn. Habknkss of Sons were 2nd, and Mr, B. R. Cant 3rd. The National Society' Silver Medal for best Rose in the show was awarded to a capitel bloom of Marchioness of Dufferin, exhibited by Mr. Framk Cawt.

Amateurs. -The Rev. J. H. Pemberton was lat for eightees distinct Roses, and a splendid bloom of Mario Baumann grinen the National Society's Silver Medal for best Rose exhibited by an mateur. Others in the stand wore aloo very good. The Rev. J. H. PRMbrator, won, for sim single trusees of one hiad, with Caroline Teatout; and H. V. Mackin, Req., Worksop, for twelve Tees or Noisette, in not fower than eight Warieties; R. E. W EST. Rer., Reigate, was 2nd. The quality varieties; R. E. WRST. Req., Rei
in this clase was not remarkable.
Local Closses. There were six clames opon only to exhibi tors within ten miles of Windsor, and the 1st of these-loe eighteon singlo trusees-was won byN. L. CoHEN, Rerf, Roglo field Green (gr., Mr. A. Sturt); sleo the claws for twelve single trusses. In the lat clsen, A. Grluskat. Req.. 8lough, was 2nd and Mise Bailey Destor, Wingfield, took a similar ponitios in the other. Six single truses were best from Mr. Jokw gon, Manor College Gardens; and Sir Robert Harvlip, Bta was lat for sir single trusses of any H. P. or H. Tes. N. I. CoHEx, Eeq., with Innoconte Piroln, was lot for the same aumber of any Tea or Noisette; and the Dowager Duchen of Sutherland for six Teas or Noisettes in dintinct varietice. Mrs F. Hemeage and Mrs. Inviva wore lot reapectively for basket of Roses, and for six bunches of garden Roees, diotinet open to loonl ladiee oniy.

## OpIEN TO MtMrgens ontr.

Pot Plants, The winner of the 1st prise for an effective group of miscellaneona planto, arranged in a circle 12 fet bl 6 feet, waw gir Robstr Babver, Bart. (gr., Mr. Gillies), whose group, composed wholly of dot plants with a groued work of ferns and Gloxinias, contained soane rether tocommon work of ferns and Gloxinias, contained soase recher tocoman D. Phillips), who had also a tanteful exhibit.

Sir R. Hapver (gr., Mr. A. Gillies), way let for siz specimidy plante and for six plants for table decoration, having fairly sood plante in each esce. The Hon. C. 8. Inst, with cour opecimen Tuchsias, and Mrs. J. Huweacte (aro. Mr. Guttridge) with six zonal Ifelargoinme, we fist in thoee clanort.
F. Riosrdo, Eeq., had lst for sir tuberoun Begonias, and the Hon. O. S. Irby had the best Ferns.
Pruet was of fair quality generally. L. Baker, Req., was 1st for two bunches of black Grapes, with ripe Alicantee; and N. L. Cohen, Esq, with unripe bunches of what we judged to The best Peaches came from Mij Crapes
The beat Peaches came from Major Legge, Fulmer (gr, Mr. J. G. Mowbray), who had Royal George of fine quality
and L. Baker, Req., the best Nectarines. Major LeGGz had also kood Nectarines, showing delicately-coloured Pitmaston Orange. Mrs. Irving (gr., Mr. Elisha), had the best Straw berries, showing Laxton's Latest of All, and Frogmore Late Pine. There were seven entries of Melons for prizes offered by Mesars. Sutton \& Sons, Reading; and Mrs. Burton (gr. Mr. W. WICks), was 1st, with Hero of Lockinge.
Vegetables.-The Hon. C. S. Irby, Taplow, was lst for a collection of Vegetables in six varieties, quality only fair. His Peas, Duchess, were not full. There were also classes for Tomatos, Cucumbers, and a Cottager's class for a collection of our varieties of Vegetables.
For Mesars. J_s. Carter \& Co 's prizes for produce from their seeds, Mr. G. P. Quelch, gr., House of Mercy, Clewor, was
1st; and the Hon. C. S. IRBY was lst with a collection of four inds grown from seeds supplied by Mr, W. H. TITT, Thames Street, Windsor.

## Misoellaneous.

Her Majesty the QuEEN, from the Royal Gardens, Windsor (gr. Mr. O. Thomas), exhibited an excellent group of miscellaneous plants, both foliage and flowering specimens. The plants in his group were well grown, and included large Palms, Crotons, Liliums, Hydrangeas, Spirsea palmata, a capital plant of Calathea (Maranta) zebrina, Gladiolus, Crasoulas, a nice plant of Alocasia Thibantiana, Humea elegans, and other ecorative species.
The trade was well represented at this exhibition. Mesers Wo. Laing a sows, Forest Hill, London, 8 E., were the
exhibitors of a pretty group of miscellaneous plants. There exhibitors of a pretty group of miscellaneous plants. There were choice plants of Caladiums, Crotons, Begonias, \&c.
Messrs. John Peed \& Sons had a group of miscellaneous plants, composed of Caladiums, Dracenas, Glozinias, \&c., containing some nice plants, but the group was too heavily arranged. A collection of hardy herbaceons flowers, and a few Roses, exhibited on two tables, were also from Messrs. Peed.
Mr. Chas. Turner, Royal Nurseries, Slough, had three groups, one large low group upon the grass, consisting of Car nations in pots, and in front a couple of dozen baskets, furished with Rose blooms in sprays, each containing one variety only, and surrounded with Fern. The quality of this exhibit eserves remark
4 amall central group ecoircling one of the tent poles was composed of Lilies and Palms, and Roses in baskets and Pelargoniums were well exhibited in another group.
Hardy herbaceous perennial flowers were capitally ahown by Measrs. Jas. Veitcri \& Sons, Boyal Ezotic Nursery, King's Road, Chelsen. They included a fine lot of Delphiniums in variety, and a representative collection of other species now in flower, beside a collection of Rose blooms.
Meesrs. Wm. CuTbusi \& Sor, nurserymen, Highgate, London, N., exhibited a nice group of Carnations in pots, omposed principally of Souvenir de la Malmaison varieties.
Mr. THos. S. Ware, Hale Farm Nurseries, near Tottenham, had a large double-faced group of Begonias arranged on a contral table, including single and double varieties. Mr. B. LADHAMS, Southampton, had an excollent lot of hardy flowers; and Mesars. Geo. JiCEmin \& Sors, Woking, the same kind of plants in fewer varieties. Mr. H. ECEFORD, Wem, Salop, had one of his elegant exhibits of Sweet Peas, including another batch of new varieties, all pretty, and exhibiting endless variety in colour and considerable variation in form.
Mr. GEO. PHIPPER, Reading, had an attrective stand of florista' productions, \&c.; add Mr. W. H. Fitt, Thames Et., Windior, had a smaller exhibit of a similar character.

## CROYDON HORTICOLTURAL.

Joly 3.-The twenty-eighth nummer exhibition was held on Wednesday last in the grounds of Brickwood Honse, the residence of J. W. Prince, Esq. As unal, the ahow was very comprehensive. Classea for Rosen and plante were numerout and well sustained, non-competitive exhibit forming a maller proportion of the ahow that is becoming common at many place.
Roses were not quite no numerous as last year, and al though the quality was good in lst prize stands, many of the blooms had been damaked by recent rains. The leading class for nurserymen only, fell to Mr. B. R. CANT, Colchester, whose forty-eight distinct blooms were good, but not exceptional. Her Majeaty, Madame Casin, Maréchal Niel, Marchionese of Downshire, Thomas Mills, Gustave Pigannean, Madame Bois, and Baroness Rothschild were among the best blooms in this atand. Mr. Frank Cant, Braiswick Nursery, Colchester, with a younger, brighter, though amaller lot, a very close 2nd. We noticed very pretty blooms of Ethel Brownlow, Marie Baumann, and Madame Gebrielle Luizet The class for twenty-four Roses, distinct, three trussee of ench was also won by Mr. B. R. OANT
Memars. G. and W. H. Burcre, Peterborough, had an excelont lot of Roses in the class for twenty-four blooms dietinct, such as Charles Lefebvre, Duke of Fife, Mrs. Jno. Laing, Earl Dufferin, Marie Baumann, Jeannie Dickson, and Ulrich Brunper, having great substance. Meers. Towssexd es Sows Lower Brond Heath, Worcentar, were and.
Mr. Pruwe Oaxt was eaeily lat for eighteas Teas or Noisettes, including in his collection pretty blooms of Eithel

Brownlow, Catherine Mermet, Corinna, and Madame Cusin. Mr. B. R. CANT was 2nd.
The best dozen of one variety was from Mr. F. CANT, being fair blooms only of Her Majesty; Mr. B. R. Cant. with Gustave Piganneau was 2nd. The best dozen blooms of a Tea were Madame de Watteville, from Mr. Frank Cant

Amateurs' and Gardeners' Classes.-The leading open class, nurserymen excluded, was won by the Rev. J. H. Pemberton, Havering-atto-Bower, Easex, who had thirty-six excellent looms ; and A. Tate, Eeq., Downside, was 2nd.
A. Tate, Esq., was lst for eighteen Tea or Noisettee, but the uality in this class was not remarkab?e
The Rev. J. H. Pemberton won for six Roees, in three trusses of each; and A. TATE, Esq, was 2nd.
The best twelve blooms of one variety were from H. V. Machin, Rsq., Gateford Hill, Worksop, who showed La France: T. B. Haywood, Esq., Woodhatch Lodge, Reigate (gro, Mr. C. J. Salter), was 2nd, with Alfred Colomb. Three lasses were reserved for growers of fewer than 2000 Rose plants, and the first of these was won by Jıs. Barker, Esq. akfield, Hitchin, who had twelve distinct blooms of commendable quality. A bloom of Fisher Holmes in this stand was awarded the National Rose Society's Medal. The same exhibitor had the best twelve Teas, and the best four Roses, three trusses of each. R H. Langton, Esq, Raymead, Hendon, was lat for nine Roses distinct among growers of fewer than 1000 plants, and also for nine Teas or Noisettes.
Groups.-The winner of the class for the best group of plants, arranged for effect, was Mr. C. Lane, gr. to E. H. Coles, Esq., Brentwood, Caterham. He had a prettilyarranged group, bright with many flowering plants, and some well-coloured Crotons. Mr. E. Mills, gr. to Frank Liord, Esq., Coombe House, Croydon, was 2nd. There were six Esq.
In a district amateurs' class for a smaller group. the winner was Mr. J. Galvin, gr, to Mrs. Daties, Purley; while a 2nd prize only was awarded to Mr. G. Rales, gr. to J. Claisher, Esq., Heathfield Road, Croydon, an exhibitor in an open class for amateurs and single-handed gardeners.
Plants. - Jno. Warren, Esq, Handcross Park, Crawley (gr., Mr. Offer), was the exhibitor in a class for nine stove and greenhouse plants, the quality of which was commendable; Boronia elatior, Ixora Fraseri, and Darwinia fuchoioides were his best plants. Johiv Warren, Req., was also let for a specimen plant with oruamontal foliage, showing a capital croton, Queen Victoria. Philip Crownex, Esq. Waddon Croton, Queen Victoria. PHilip Crowlesx, Req.o Waddon
House, Croydon (gr., Mr. J. Harris), had the best flowering House, Croydon (gr., Mr. J. Harris), had the best flowe
specimen, in a good plant of Clerodeadron Balfourianum.
For six ornamental foliage plants (greenhouse), Mr. M. E. Mills, gr. to Franis Lloyd, Esq., Coombe Honse, Croydon, was 18t. He had a good plant of Pritchardia pacifica, Anthurium orystallinum, A. Warocquennum, \&e. Mr. H. G. Filbey, gr. to Mrs. F. Berns, was 2 nd.
The 1st prize for six exotic Ferns was taken by Mr. Horne, gr. to H. TıTE, Heq., Streatham Common, who had capital specimens of Adiantum cuneatum, A. cardiochloena, Microlepia hirta cristata, Marattia fraxinea, and Nephrolepis ensifolia.
Nine ornamental foliage plants were very good from J. Warrew, Eeq., his Croton Williamsii, C. Warreni, Cycas revoluta, and Kentia Belmoreana being very worthy of remark. Philip Crowley, Rsq., was 2nd. Begooias in a
collection of nine were best from Mr. J. Slater, gr. to Mrs collection of nine were best from Mr. J. Slater, gr. to Mrs.
Hulse, Shepley House, Carehalton ; and Mr. J. Knapp, gr, to F.W. Amsden, Esq., Chichester Road, Croydon, was 1st for six plants. Pelargoniums in six plants were won by Mr. E. Perrett, gr. to Mrs. Fuller, Duppas Hill; and Frank Lloyd, Eleq., was lst for six plants of Caladiums.
Selaginellas from Philip Crowley, Ksq., were excellent, particulariy 8. apoda and S. Poulteri. Tae same exhibitor was lat for nine distinct Ferns in 6 -inch pots. Fucheias and Pelargoniums were shown in other clasees, and were of average quality
An uncommon class was that arranged for a collection of succulents. There was only one exhibitor, Mr. C. A. BLoe日, Brighton Road, Oroydon, but his plants were worth notico. Mr. F Bas not shown exteneively, but the quality was good解 tolerably well-coloured bunches of Black Hamburgh ; and $\mathrm{Mr}^{\text {r }}$ E. M. Bethune, Denne Park, Horsham, won in the class for White Grapes, with three bunches of Foster's Seedling. For a collection of fruit in six dishes, a good lot was staged by Mr. J. Munro, gr. to James L. Bricenell, Eeq., Langley Court Beckenham. His black Hamoburgh Grapes, Peaches, and Straw-
berries were remarkable. Mr, E. Mills, gr. to Frank Lloyd, Esq., with Prince Alice, had lat prize for a dish of Straw berries.
Vegetables were of good quality, and table decorations ware attractive and tasteful.
Miscellaneous,-Messis. Jwo, Lanve \& Sows, Forest Hill, London, S.E., had a central and two side groupa at the entrance to the large plant teat. The two smaller groups were com posed of a collection of choice Caladiums, and the ceutre one was made up of double and single-flowered Begrnias of ex ceptional merit. We noted Duchess of Fife as one of the prettiest and most attractive single-flowered varieties we have neen. Mesars. Laine had also cut Roses, cle.
Mr. Jwo. R. Box, nurseryman, West Wickham and Croydon, staged a group of single-flowaring tuberous Begonias, remark able for their bright colours and good form. A group of herbaceous plants and flowers were also shown by this exhibitor.
Meears. J. Chical \& Sons, Crawley, Sussex, exhibited a nice lot of hardy flowers, including some fine Gaillardias, Violas, \&o. Mr. T. W. EDMUNDS, nurseryman, Wecterham, Kent, had hardy 10 swers and Rosee.
Mosers. Curbusir \& Son, Highgste Museries, London, K.,

Mr. E. Chaff, nurseryman, Croydon, exhibited floral arrangements.
Mesers. Jmo. Peed \& Sons, Roupell Park Nurseries, Norwood Road, London, had a tasteful group composed of Crotons, Lilies, Caladiums, Forns, \&c.

## LEE, BLACKEEATH, AND LEWISHAM HORTICULTURAL.

Jour 3-The annual exhibition by this society was held on Tuesday laet in the groande of "The Cedars," Lee. Several tents were well filled, and the diaplay in each was good, Rosen, decorative and flowering planta, cut flowers, fraits, and regetables, were all well reprenented.

## Roses.

The largest class for these is equal in its requirements to that of the National Society at the Crystal Palace. The beat serenty-two blooms were undoubtedly those from Mesars. Harkness \& Sows. Bedale, Yorkshire, and this firm was awarded 1st prize; Messrs. D. Prior \& Sow, Colchester coming 2nd. Later in the day, however, the exhibit from Messre. Harkiress was disqualified, as "not according to schedule," and Messrs. D. Prior \& Eon were placed lst, followed by Mesars. G. \& W. H. Burci, Peterborough. In Messrs. Hark NESs' stand we noticed very fine examples of Her Majeaty Madame V. Verdier, Augusta Rigotand, Captain Haywand Horace Vernet, Mrs. John Laing, Marie Bavmann, and Gustave Pigannean.
In the class for lorty-eight blooms, Messra. Harkness were lst, and Mesars. Prior \& Now 2nd; but positions were reversed in the class for twenty-four blooms, and Mesars. Prio were lst and Mesers. Hareness 2nd. There were a few other minor clasees.

Plamts, \&c.
Mr. F. Foz, gro to Mrs. PEWN, The Cedars, Lee, with six nice Palms, took 1st in this class; and was similarly succoseful with twelve very commendable stove and groenMonee plants. Mr. C. Birch, gr. to R. WhXTE, Keq., Old Road, Lee, who was and in the latter class, included a well flowered specimen of Aristolochia elegans. Mr. Birch wa lst also for gix exotic Ferns, including excollent plants of Davallia fijiensis, and Adiantum scutum roseum; 2nd, Mr C. Nunn. gr. to W. Soames, Ksq., Maize Hill Honse, Greenwich. With a very fine Ixora Pilgrimi, Mp. Birch was lst for a specimen plant in flower: and Mr. Nunn 2ad, with Clerodendron Balfourianum. Mr. Birch was again succossful in the class for sir stove or greanhouse plants, and included capital specimens of Ixora Prince of Orange, Plumbago capensis, and P. C. alba.
Six foliage plants were beet from Mr. J. Lambert. gr. to H. W. Segelcke, Eeq., Herne Hill, who had very commandable specimens. Mr. Lambert was lst for an effective group, and Mr. C. Nunn 2nd, neither exhibits calling for remark.
F. Fonias were fairly good, and lat prizes wetaken by Mr F. Fox, Mr. H. Horton, gr. to Major-General Ashbirnmer, St. John's Park, Blackheath; and Mr. F. Johnson, gr. to S. Brailsford, Eeq., Tudor House, Blackheath Park. Calediums were also of good quality. Mr. Nunn was let for six plants, and Mr. W. Payne, gr. to C. D. ABEL, Esq., Eastcombe Villas, Blactheath, 2nd. Dracænas were well grown as exhibited by Mr. J. Lambert in the class for six plants, and Mr. T. Alley, gr. to R. Kelsex. Esq., Hurst Lodge, Lee, was commendable in a claes for four plants.
Mr. F. Fox took ist honours for a group of plants arranged upon a table; and Mr. C. Nunn iwas Ind. The contrast between the two exhibits was great, Mr. Fox haviag made hie group exceptionally bright by a free use of flowering and variegated plants, while the one from Mr. Nunn was uncom monly dull.
A clam which is almost peouliar to this exhibition, is arranged for twenty-four miscellaneous atove and greenhouse plante. The specimens exhibited are always moderate in size, generally of good quality, but calling for no special remark. Mr. C. Birce was 1st in this class on Tuesday last, and Mr. F. Fox, 2nd.
There were minor clatses for Orchids, Gloxinias, Fuchqias, Pelargoniums, \&c., and for various cut flowers.
Two clasees for spraye of Violas were essily won by 1.J. Rowberry, Eeq., The Crescent, South Woodford, his exhibits in the classes for twelve sprays and for six pprays being superb.

## Frut and Veertables.

This was present in moderate quantity only, Mr. J. YuIFord, Bickley Hall Clardens, was lst for a callection, and included in this a ragaificent dish of British Queen Stramberries. Mr. C. Birce was 2nd. Me. Fulford was also lst for one bunch of black Grapes, showing Gros Maroc, but the clase for three bunches was won by Mr. E. Goadard, gr. to T. M. Whitraker, Eaq., Eltham Road, Lee, with good Black Hamburgh, and the same exhibitor showing Backland Sweetwater, won in the class for three bunches of white Grapes.
Vegetab'es were very excellent in quality. The principal prize winners were Mr. Fulford, Mr. Fox and Mr, Mas Wemeter.

## Mtscenilaneouts.

Mr. H. J. Jowes, Byecroft Noreery, Lawihham, ahowed an excellent group of Begonias tastefully reheved by a roe use of the light varieties of Ferns. Meears. PEED Some, Roupell Park Nurserios. Upper Norwood, had a roup of Caladiums and other ahoice planta. Measrs. H. CAxKELI \& Sonss, Iwanley, Kent, exhibited a group of Begonias and some ipriye of Canos Quow Chariotio. The Agriculteurl
grown from seeds supplied by them; and Mr. Howlind, Vine Nurseries, Lee, exhibited groups of miscellaneous plants

Cottagers' Exhibits.-The produce from cottagers, arranged in ons of the tents, was very satisfactory.

## KEW NOTES.

Philadelphos Libmoinei $\times$,-Of the Mock Orangen now in bloom, there is not one possessing more attractive qualities than this. It is a hybrid, having been raised by Mons. Lemoine of Nancy, by crossing P. coronarias with P. microphyllus. In leaf characters, stature, and size of flower, it is intermediate between ite parente, bat besides being quite diatinct, it is superior as a garden plant to either of ita parente. Whilst it is larger and more showy than P. microphgllus, it has parer white flowers than P. coronarins, and their delicate, almost pine-apple like fragrance is much to be preferred to the heavy perfame of that apecies. A circular bed aboat 14 feet across in the Arboretum at Kew filled with this plant is now in perfect condition, and makes one of the most charming massea of flower to be seen in the garden. The shoots made last year are 2 to $2 \frac{1}{2}$ feet high, each one an erect columnar masa of pure white, fragrant blossom. Mons. Lemoine sent out this hybrid some seven or eight years ago, bat ite exquisite beanty is far from being as generally snown as it deserves to be.

## Rosa multiflora (syn. R. polyantea).

For the past few week thit Asiatic Rose has been the most effective of all the apecies in flower. The blostoms individaslly are mall (acarcely 1 inch acrons), but they are produced in such profusion that their want of aize is no defect, but adde rather to the distinctive character of the specien. A large mass of it is grown in the kose collection at Kew, and it occurs in various other parte of the grounds. Most atrikingly, perhaps, is ita beauty seen in the Bamboo garden, where it in planted on a bank and allowed to clamber over old tree-roote, forming huge mound of white flowers. Its amall flowera, whone fragrance may be detected many yards away, ite cone-nhaped, numerously-flowered truseses, and the fimbriated atipules at the base of the leaf, render the species an eavily recognised one. The long, arching ahoots grow to a length of 8 or 10 feet in one season. It is a native of China, Japan, and Corea, but although the double-flowered variety has been known in England aince the early years of this century, the trae aingle-flowered type was introduced as lately as 1875. A fine specimen in figured in the Gardeners' Chronicle for November 26, 1887, under the name of Roma polyanths.

## Spibea bracteata.

If not one of the verg latest additions to the genue, this is at least one of the mont ancommon of Spirzas in English gardens. It is a very pretty pecies, of compact habit, growing to a height of 2 or 3 teet (perhapa more eventually), with abundant obovate or almost orbicular leaves, which frequently have a few shallow teeth near the apex, and are of a peculiarly rich, lustrous green. The flowers are pare white, and fragrant, and are borne on thort, cone-shaped corymbe. The name bracteata refera to a bract midway on the atalk of the flower ; on the lower ones it is large and leaflike, becoming amaller and amaller towards the terminal flowers of the corgmb. According to Profenaor Sargent, this species is a native of the mountainous regions of the main Island of Japan, and among other places is found on the slopes of Foji-san. It aopears to have beed first introduced to Earope by Von Siebold. A fowering shoot is figured in the Gavdener'' Chronicle for February 28. 1885, as S . media var, rotundifolia alba. It may be increased by means of cuttinge taken as soon as the wood hat become fairly firm. [See alro Hemoley in Gardeners' Chroniele, June 16, 1894, p. 740 . Ed.]

Although a native of Madeira, this beantifal Genista pased through the froste of last February with carcely any injury-a marked contrant to the
behaviour of aeveral other leguminiferous plants, amonget which are natives even of our own country. A good many years ago some acores of plants were put out in the wild semi-wooded part of Kew Gardens nearest Richmond. Although the soil here is the poorest anad, thene plant have aucceeded well, some having grown into large apreading bushes 8 to 10 feet high, and even more across. It is, in fact, the largeat of all the hardy Geniatac. Every July these bushes are crowded with racemes of bright golden yellow flowers, and amidat the arroanding greenery these masses of glowing colour are particularly effective. The leaven are mall, lanceolate, and not divided. It was introduced as long ago as 1777, and was figured by Lindley in his Botanical Register in 1844 , but atill remains quite an ancommon plant. Daring the latt few years it has, however, been planted more extensively. W. J. B.

## COLCHESTER ROSES, 1895.

IT wae with many miagivings that I turned my head towarde Colchenter on the early morning of June 20. I had seen many Roses cut hard by the frost of February, and had many sorry tidings about others. And now the opportanity had come to teat the condition of the Rosea in their great and ever enlarging home in East Anglia. To this end I was to asaitat as jadge at the Colchester Rose, Flower, and Fruit Show. Lanch among the Roses, and with roaarians at Mr. Frank Cant's, and walk through as many Rowe gardens as posible. A glimpse at the Roses in this show was most encouraging.
The Colchester Rose and Horticultural Society was apecially favoured this year by the weather, though a soaking shower passed over the tents about 12 o'clock. It also enjoyed the warm patronage of the ex-Mayor, Henry Goody. Eaq., and of the present Mayor, E. Egerton Green, Erq., the Prenident of the Horticultaral Society, who has been indefatigable in his efforts to make the Rose show one of the chief features of the gear. In this, assisted by the Mayorens, who presented four Medals for the four beat Roses, he has admirably ancceeded, and he crowned the edifice, as it were, of his other gifte by devoting his personal service on the day of the show, and granting the Society the ase of him benatiful grounds at East Hill House, near the Castle.
So far an the trade were concerned, the Colchester growera won and held the field for prizas among them, courteously changing places among themselves, bat resiating the ingress of outaiders. Mr. Benjamin Cant, the veteran grower, and founder of the Rose induatry, was lat for thirty-six, and Mr. Frank Cant and the Mears. Prior \& Sona winning the other chief prizes.
Among amateara there was a wider competition, though a very creditable share of prizes were also won by Colchester growers, such as the present Mayor with the energetic secretary of the aociety, Mr. C. G. Orpen. The winners of the four silver medals presented by the Mayoress were Min Pomberton for a grand bloom of Horace Vernet, Mr, O. G. Orpen for the beat Tea, The Bride, Mr. Frank Cant for a beautiful bloom, La Fraichear an anard rather aeverely criticied. Mr. Wiloon Marriage had the fourth medal for the beat dozen Rones.

Among other fine Roses at Colcheater on the 20th were Maréchal Niel, Madame Canin, Soavenir de S. A. Prince, Catherine Mermet, Jean Dacher, Comtesse de Nadaillac, Belle Lyonnaise, sad Marie Van Hoatte. Among perpetaals, the following, among others, were good for colour, size, form, quality:Horace Vernet, Mra, John Laing, Duchess of Oxford, Dr. Andry, Dapay Jamain, La France, Marie Baumaad, Madame Gabrielle Laizat, General Jacqueminot, Prince Arthar, Joha H.spper, Earl D. 4 ffrin, Senatear Vaise, Dake of Teck, Dake of Ediabargh, A. K. Williams, Charlen Lefebrre, Grandear of Cneshunt, Lady Mary Fitz willism, Marie Rady, \&ce.

And now, after a most auccessfal meeting of ronarians, and a most hoopitable lanch at Brainwick, we are fuce to face with thousands and teas of thousands of Roses, and Briart of all posible sorta
and nizen. Almost the only mart they bear of having passed through a semi-arctic winter is that the majority of the Roses are a week, perhapa two, behind time. Hence, had the show been a fortnight later, Colchester's beat would bave been yet more brilliant and perfect than on Jane 20 .
Without exaggeration, the Colchester Rous were without speck or flaw of any sort. On ex. amining acre after acre, not a sign of mildew nor speck of rast were seen, nor a bud bored, nor a leaf browned, nor barrowed by caterpillars or maggoth, And yet the persistent drought and the ever-preesent north-east winds, are held to be the most potent factor in the prodaction of disease. Neither hat the trade in Colchester the mean nor the will to adopt artificial watering. Bat they fight the drougbt through liberal, deep calture, and a loose surficemalch of frequently-boed soil.
It seems that bat few of the Roses bad had their heads or root protected last winter, and it war marvellous to see sach aurvivals of atandard perpetuals, and dwarf Teas-acre after acre, in wellfilled rows, in robast health and bighest vigour. The Rose grounds in and around Colcheater vary somewhat in character and aupact, and in some portions the atandard Teme were hit very hard, and the dwarfe cut to the ground. Others covered their utandard Tens with Pea-straw, and these were asved; and the enormous brakes of the latter, in robuet health, rashing into bad, were worth a journey of a handred miles to see in these times, when we hear anch depreasing reports of the wholessle slanghter of the innocent Rones in February, and the lingering, enfeebled life of yet larger nambers over since. D. T.F.

## ©bituary.

S. A. WOODB.-We regret to hear, through the Journal of Horticulture, of the death of Mr. Woode of Osberton on the 26 sh alt. from poisoning, It appears that the deceased bas suffered from gout, and from nervoas depression. Oa the morning of his death he was in great trouble about his Grapes, and anked his wifo to go and see them, remarking, "I know I shall go mad." Shortly after this he took a bottle of "Waop Destroyer," which resalted in his death. Mr. Woods, who was fiftyone, has been gardener to the Foljambe family for eighteen jears, and has given great antiofaction.

Alderman Masters.-The death is recorded in the Evesham Standard of this well-known market gardener, at Evesham, st the age of sixty-eight. The deceased gardener was thrice Mayor of hit native borough. A few jears ago he was Secretary to the Fruit Pests Committee, a committee of investigation which made experimente as to the beat methods of destroying frait-pests ; and before the revision of rates, Mr. Masters was one of a depatstion who laid the views of the gardeners before the President of the Board of Trade. In every particular connected with the market gardening induetry the decemaed brought to bear an exceptional degree of intelligence and perseverance. Journal of Borticulture.

## New Potatos

French and Channel Islands' arrivals heavy, prices lower. Home-grown now coming in, and selling at $8 s$. to 10 s. per cwt.

Old Potatos.
A few still uncleared. J. B. Thomas.

## SEEDS

Lonnon: July 3.-Messrs. John shaw \& Sons, Seed Merchants, of Great Maze Pond, Borough, London, S.E. write that but few buyers visited to-day's seed market, and Triforequirements were neither large nor numerous. French Trifolium attracts increased attention. For sowing Mustar and Rape seed there is a somewhat improved inquiry. Hari cot Beans being exceedingly scarce, realise full prices Blue Peas are harder in value. Bird-eeeds at this inective period show no fresh feature. Linseed steady. Buckwheat rathe chesper.

## FRUITS AND VEGETABLES

Borovari : July 2.-Quotations:-Peas, 2s. 6d. to 3s. 6d. per bushel; Horseradish, 1s. to 1s. 3d. per bundle: Apples, Tasmanian, 4s. to 8s. per case; Strawberries, $1 s .6 d$, to $2 s .6 d$ per peck; Gooseberries, 1 s . 3 d . to 1 s .9 d . per half-sieve.
SPITALFIELDS: Ju!y 2 -Quatations:-Cabbages, 3s, to 58 per taly: Carrots, French, 2s. 6d. to 3s. per dozen bunches Turnips, 2s. to 3s. 6d. do. ; Peas, best blues, 2s, to 2s. $8 d$ per bushel ; do., bags, 4s. 6d. to $5 s_{.}$; white do., $3 s_{\mathrm{s}} 6 d$. to $43^{2}$ Broad Beans, 2s. to 2s. 6d, per bushel.
STRatrond: July 2.-There has been an excellent supply fall kinds of produce at this market during with a good attendence of buyers, a brist trade wae done; Quotations: Cabbages, 1s. to 3s. partally : Canlifowars, is to 8. 6d. per dozen: Gooseberries, 1s. 9d, to 2s 3d Per half ieve: ditto, 3s. $6 d$. to 4s. per flat: Red Currants, 38 ed to 4s. $6 d$, per half-sieve; black, ditto, 5s. to 5s. $6 d$ per halt ieve; White Cherries, 4s. $6 d$. to 5s. per half-sieve; black, ditto, 4s. to 43. $6 d^{2}$. per half-sieve; Cucumbers, 1s. $6 d^{2}$. to 3s. 6d. per dozen; Green Peas, 3s. 6d. to 5 s . per bag; ditto, s. 9 d . to 2s. 3 d . per sieve; Onions, Egyptian, 100 s. to 120 s. per ton.

FArringdon: Ju'y 4.-Quotations:-Apples, Tasmanian 8. 6d. to 9s. 6d. per case: Strawberriee, 2s. 8d. per peck rooseberries, 3s. 8d. to 48. per half-bushel: Raspberries, 2s. er amall basket; Cherries, 5s. per half-flat; Currants, red, 3s. to $3 s, 6 d$ per half-bushel ; do., blact, 68 . do. ; Pine-apples, 3. 6d. to 3s. each; Tomatos, English, 5s. per docen ( 1 lb .) ucumbers, 2s. to 2s. 6d. per dozen; Lettuce, 9d. per score Cabbage, 48. $6 d$. per tally; Carrote, 1s, per dozen bunches.

The districts indicated by number in the first columen are e tollowing:-

0, Scotland, N. Principal Wheat-producing Distriets1, Scotland, E.: 2, England, N.R.; 3, England, E.; 4. Midland Counties; 5 , England, including London, 8 . Princtpal Grazing, Sc., Divtricts-6, Ecotland, W. '7, 10. Ireland. \&. Ohannel friaris.

## THEPA8TWREK

THE following summary record of the weather throughout the British Islands for the week ending June 29, is furnished from the Meteorological Office:-
"The weather was again fine and dry during the earlier part of the period, but later on the conditions became showery and unsettled generally, with thunder and lightning in many places. Over our extreme south-east counties, however, the rain was very slight and local. During a thunderstorm on the 20th the rainfall at Churchatoke was exceedingly heavy.
"The temperature was above the mean, the excess ranging from $2^{\circ}$ in "England, E. and the Channel Istands" to $5^{\circ}$ is "Scotland, W. and Ireland, N.' The highest of the maxima were recorded during the eariy daya of the week, when the thermometer rose to $87^{\circ}$ in 'England, $\mathbf{8 . W}$.' (at Llandovery). to $86^{\circ}$ in the 'Midland Counties' (at Bawtry), and to between $81^{\circ}$ and $83^{\circ}$ in moet other parte of the Kingdom. In thin 'Channel Isiands,' however, the highest readiag wae 790, and in "Scotland, X. and W.," $78^{\circ}$. The lowest of the minima were registered batween the 24th and 20th, and ranged from $37^{\circ}$ in ' Seotiand, Es,' adi $89^{\circ}$ in 'England, E., and the Midland Counties, to $48^{\circ}$ in 'Scotlasd, $\mathrm{W}_{0,}$ ' and to $3 y^{\circ}$ ia the 'Oharatel Islende。
${ }^{5}$ The rainfoll was again less than the mean in 'England, E. and S., and in the Channel Islands, as well as in Scotland, W., but just equalled the normal in "Scotland, N. and England, S.W., while in all other districte there was an axeess. At Churchstoke on the 20th, the abnormally large fall of 4.83 inches was recorded.

The bright sumshine continued very prevalent cenerally. and exceeded the mean in all dietricts. The percentage of the possible duration ranged from 59 in the 'Channel Itlands, and 54 in ' England, S.,' to 34 in 'England, N.W.,' and 33 in 'Ireland, N.'

** Owing to the large increass in our circulation, qos are reluctantly under the necessity of going to press some howrs earlier. Our contributors, who well know what this implies, will kindly aid us by sending their communications as early in the week as possible. Communications should receh us not later than Wednesday.
** Blants, Fruits, ETC., to en Named.-Correspondente sending plants or fruits to be named, or esking questions demanding time and research for their solution, must not expeat to obtain an answer to their enquiries in the current woek. Specimens should be good ones, carefully packed and numbered, nd not more thas sice should be sent at ons time. Loaves only, or lorists varieties cannot, as a rule, be named.

Addendum: MonarceSteawberry, We inadvertently omitted to mention in our report of the last meeting of the Royal Horticultaral Society that a First-clask Certificate was awarded the above variety, thown by Messrt. Lixton Bros. of Bedford.
Annual Importations, etc, of Hardt Feuts: Enquirer, I. W. A oummary is to be found once a month in our columnt. The consumption is not known, and cannot be known in the preaent condition of internal atatistical information. The value of import is usually given in our monthly tablen. Faller information could be obtained from the reports of the Board of Trade. For your fifth question, we mast again refer you to your Chronicle p. 714, isaue for Jane 8 this year.

Black Hamburgh Vines and Muscats: $F$. A. The inarching of an early on a late variety is seldom desirable; beaides, if the Muscat do not succeed you cannot expect that the Black Hamburgh would do any better on the roots of the former. There might be a light trace of Muacat flavour imparted to the fruit by the union, and probably there might reault a diminution of the dark purple colour, and maybe a toughening of the skin of the berriet.
Boors: W. G. S. The Carnation, by E.S. Dodwell, publiuhed at the office of Gardening World 1, Clement's Inn, W.C.-E Trimellin. Borticultural Hand.book and Exhibitors' Guide, mecond edition, published by Blackwood \& Sons, London and Edinburgh,-J. V. 1, The Chemistry of the Farm, R. Warington. Yea, apply to Secretary, King' College, Strand, London; 3, There is no one book that includes all you desire. W. G. Smith's Diseases of Field and Garden Crops (Macmillan). H. Maruhall Ward's Diseases of Plants (Society for Promoting Chriatian Knowledge).
Campanulatr Foxglove: J. B. Many thank. It if of frequent occurrence for several of the topmost flowers to become fased into one regular flower.
Carnations: Constant Reader hould know that the publither has no more to do with ach matters than the editor has with sdvertisemente. Your Carnations sre attacked with eel-worms, Burn the plants, and use fresh oil. No insecticide mould be used on fruitu approaching the ripening state.
Corrnction,-Fior "germinules," on p. 791, read "gemmules." Report of Yoha Gama: Mr. McPherson, of Londenborough Park Gardena, deaires ut to say that it was he who took the 2ad prize for black Grapen, and not Mr. J. Johnson, as wan stated by our reporter.
Cortage: Merton. If the cottage in given you in part payment for services rendered, you will have to quit it when the engagement comes to an end.
Galls on Lime Trabs: $\boldsymbol{H}, \boldsymbol{H}$. The galle are the Fork of a minute midge, Cecidomyia tloricola. The larva will be found in the centre of the gall.
Grapas Rustrio: Ji $\boldsymbol{R}$. The Grapen have been exponed to currente of cold air, or hard firing or the excestive ane of alphar whilet young. Sometimes
touching the berries with the hand, or hair of the head will canse it. There in no remedy, and all rusted berries should be cut out as soon as noticed.

Mildew on Vines: In Trouble. Beyond doing what you have done, you might place aancers about the honse filled with water in which flowers-ofanlphar bave been mixed, which will give off sulphurous fumes inimical to the mildew. The apote on the berries that you remark, are the dead patches of mildew. The skin thas affected has lost its vitality, and cannot expand as the berry grows in size, the consequence being that the skin will be ruptured, and the berry decay. When mildew attacks the frait that is inevitable.
Nabes of Plants: W. T. T. Ideaia polycarpa, Jadan, Bixaceze dicecious, Halesia tetrapteraMarshall. Leaf of Poplar, Popalus monilifera, the Canadian Puplar probably.-G. T.D Hyoscyamus niger, Henbane.-J. A. Roua polyantha-BogCottom. 1. Hs menophyllum tunbridgense ; 2, Aspidinm spinulosom; 3. Eriophorum polystachynm ; 4 Cotyledon umbilicus; 5 , Stellaria graminea.-W. $\boldsymbol{H}$. Magnolia glauce - A. M. 1, Potentilla fruticosa ; 2, Spirma confona; 3, an evergreen Oak; 4 Orchis pyramidalis ; 5, Orchis pyramidalis ; 6, Orchin maculata.-Ribes. 1, Epidendrum oncidioides; 2 Dendrobium Pierardi; 3. Pelargoniam tomentonnm (Peppermint-acented Geranium of gardens); 4 , Sedam Sieboldi; 5 , send in flower; 6, Buagainvillea apectabilis ; 7 , Geanera bulbosa, often called aplendens in gardens.-J. S. U. Kalmia angus-tifolia.-J.A.M. Pendulous tree, Planera Richardi; Roses viridifiora, the green Rone; the other plant not recognined.
Pin: © $\mathbf{A}$. R. B. \& Co. The Parple Podded, a variety of the Marly.
Thensis Lawn: G. G. 39 feet by 36.
Temtmonial: Merton. It belonged to you, and you should not have parted with it. You may claim it, but the dfficulty will lie in obtsining possesnion, if your late employer thould object to give it up.
Toustos: A. W. E. Refer to recent numbera, where vou will find the diveace mentioned under tne head of "sleepy disease."
Vrsus: S. A. The fungua in called Cladouporium viticolum. Burn all infeated leaves, and nex: season apray with a dilute solution of Bordeanx Mixtare at intervala of a fortnight, during the growth of the leaver, G. M.
Vises not Gmowng: :W.W. They will do no good, the Vine being above all things asun-loving plant, and by your own showing the sun cannot shine on the vinery or the border for more than four hours a day. Fancy what that means in cloudy weather. All your endeavours to carry out a proper mode of caltivation will be fraitlens.
Vines and Mealy-bug: N. Z. Having failed to extirpate the peas by means of the old recipes, why do you not give Richards' XI All Vaporiser a trial. It will not do harm to the Grapes or anything eles, and it is deadly to every kind of insect.
Whits-nlowered hona sugosa at Kaw: L. G. G. The plant mentioned is the variety Bianc double de Coubert.

Gardenkrs and others Wanting Situatioms. 26 words, including name and addres, 1s. 6d., and 6d. for every additional line (about mine words) or part of a line. These Adverticements must be prepaid. This scale does not apply to announcements of Vacant Situations, which are charged at the ordinary scale.
Birthe, Deaths, and Marriagss, ©o. each insertion.
Notioy to AdVirtisers.-In many instances Remittances in Payment of Repeat Advertisements are received without name, address, or anything beyond the postmark on envelope by which to identify the sender; this in all cases causes a very great deal of trouble, and frequently the sender cannot be identified at all. Advertisers are requested when Remitting to give their Names and Addresses, and also a Reference to the Advertisements which they wish repeated.
Posirion.-Advertisers are specially requested to note, that under no circumstances what ever can any particular position be guaranteed for advertisements occupying less opace than an entire column.
Postal Ohders.-To Advertisers, Subscribers, and Others.-It is very important in remitting by Postal Order that it should be filled in payable at GREAT QUEEN STREET, London, W. C., to A. G. Martin, as, unless the number of a Postal Order is known, and it has been made payable at a particular office, and to a particular person, it is impossible to prevent any person into whose hands it may fall from negotiating it.
N.B.-The best and safest moans of Remitting is by POST-OFFICE MONEY ORDER.
Advertisements for the current week Mçar reach the Office by first post, Thursday morning.

SATURDAY, JULY 13, 1895.

A GLOUCESTERSHIRE GARDEN.*
SINCE the publication, in these columns, some N twenty years ago, of "A Year in a Lancashire Garden," there has been a succession of similar books. Some of these have been written with literary skill, but little knowledge of plants. Some have been more conspicuous for frothiness or sentimentality than for the advancement of knowledge. Rare, indeed, has been the oombination of an expert's knowledge and the scholar's reading with the fluenoy of a ready writer. Bat this is what the reader will find in the present volume, and having found it, he will assaredly, in Diokensian phrase, make note of it. The work owes its existence to certain papers pablished from time to time in the Guardian. As now colleoted, they form two series, one dealing with the aspeots of the garden in each month of the year, and the other with various categories of plants and misoellaneous cognate subjects. The garden is, of course, that favoured one in a warm corner of Gloncestershire which has been the object of loving attention on the part of two generations of plant-lovers. It is necessary to bear this in mind, for such a happy oombination of circumstanoes is rare.
Few things afford a better illustration of the character and proolivities of a man than does his garden. Tastes differ, opinions vary, natural intelligence and acquired knowledge are possessed in the most diverse degrees, and all these diversities become manifest in the garden. In some cases the plants exist for the sake of the garden, in others it is the garden that is the casket or the setting for the plants. No hard-and-fast line can be drawn between the two oategories as they occasionally blend or overlap. When this does occur, the result is a oombination of beauty and interest than which nothing more desirable can be imagined. The anthor of the present volume recognises this, for he sates at the outset that "every garden has its own special and separate character, which arises partly from the tastes of the owner or his gardener, but atill more from the situation, aspect, and soil of the garden." As a general statement this is, of course, true; but it is equally true in speoial cases; that the tastes and knowledge of the gardener oast their impress on the garden, even when the natural conditions are not propitious. Obatacles do bat serve to bring ont the skill of the gardener. The garden at Bitton is known by repate to so many that some acoount of it from the author's pen will be weloome:-
"It is not a large garden-the whole extent, inclading a good proportion of lawn, being about an acre and e half, and in shape a parallelogram, or double equare. It lies on the west side of the Cotawolds, which rise about half a mile away to the height of 750 feet; and about fifteen miles to the

* In a Gloucenterihire Garder, by Henry N. Ellacombe, M. A. \&e. (Edward Arnoln, 37, Bedford Street.)
nouth are the Mendips. These two ranges of hilla do much to shelter as from the winds, both from the cold north and easterly wind and from the mouthwest winds, which in this part of England are nometimes very violent. I attach great importance to this kindly ahelter from the great atrength of the winds, for plants are like ourselves in many respects, and certainly in this, that they can bear a very great amount of frost if only the air is still, far better than they can bear a less cold if accompanied with a high wind. The garden, then, has this advantage of shelter. It has also the advantage of a good aspect, for though the undalations are very slight, the general alope faces the outh; and it has the farther advantage of a rich and deep alluvial soil, whicb, however, is no impregnated with lime and magnesia, that it is hopeless to attempt Rhododendrons, Azalear, Kalmias, and a host of other thinga. It has the further diadvantage of being only about 70 feet above the sea-level, which makes an inauperable difficulty in the growth of the higher alpines. On the whole, the garden is favourable for the cultivation of flowers, and especially for the cultivation of abrubs, except those which dislike the lime."

This preliminary account is defective ; the acene of operations is brought before un with more or less fidelity, but the warm oolite wall ia not mentioned, nor is the water supply alluded to, and nothing is said as to the hiatory of the garden, although its prement condition can hardly be fully understood without some reference to its gradual progrean in the past. As to the gardeners, the moving spirits, the entire book teatifies to their devotion, their knowledge, their akill, their thankful appreciation. Canon Ellacombe in this volume take us round his garden, chatting pleasantly the while on plants and their way and apparent caprices, on soils and seasons, on the endless literary suggentions afforded by the aubject.

Ae we go on our way with the author, there in no distarbing element, no inclemency of weather, no hurry, no train to be met; bat there are the lawn and the noble trees, and the long series of plants of never-ending interest-there, too, is the genial and cholarly Canon at your elbow, full of garden-lore, botanic knowledge, and apt allation. Hard by in the well-stocked library, where is ample means of "verifying references." Close at band is the noble isteenth-centary charch, bat of this we mast not speak further than to say that it adds additional beauty and interest to the scene. Citation from uch a book is a difficult matter, but to show how observant its author is we may adduce the following pasage:-
"An aoon an it (the piatil of the Hazel) in fertilined vary carious thing happens, of which I know no other instance. The little flower is placed upon last year's wood, and if it were an Apple, or a Peach, or any other fruit tree, the perfect fruit would be there also. But the nut acts otherwise, it at once starts away from the old wood and forms behind itself a thin branch 4 or 5 inchen long, at the end of which it ripens into anot; and as it so travela it carriea with it the bract in which the flower was formed, and which at last becomes the pretty cap in which the not lies."
This fact must be familiar to many, but we do not remember to have seen any record of it. The course of proceedings is aurceptible of a different interpretation, but the fact remain. "Uplifting" and "concrescence" are, of common phenomena in plants. The fertilisation of the Hazel is in many way" precocions. The two red utylen are conspicuous enough at the time when the pollen is shed, but the observer may look in vain at that time for the ovales, or even for the ovary. They are not formed till long afterwards. The point is very carious, at bearing on the question whether or no the pollen does ever exert an influence on the various coveringa of the seed, as well as on the embryogerm encloed withia them.

The teroptation is great to dilate on other suggestive pasage in Canon Ellacombe's book, on the germination of reed, the forces called into play raring growth, the numberless "myateries" that
attract the attention of the observer, and incite him to attempt to explain them. The sources of interest are indeed endlens, and their practical application not to be overlooked either. "From another habit of many plants I get," says the Canon, "another object-lesson, from which I learn that plant-life knows no rent." With the requisite limitations, this is a true atatement of fact, but one generally overlooked by the gardener.
The gardener will find in the present volume numerous hint as to the cultivation of various plants, whilst the plant-lover, turning over it pagen, will come upon pasages which will keenly excite his sympathies. Read this and judge whether it does not express a great truth. Allading to an unweeded garden, wherein "thinga rank and gross in Nature posseas it merely," the author-a gardener, be it remembered, whose competence is above testimony, says:-"But I have almost an affection for weeds, a decided affection for some of them, and I have not much sympathy with those who asy that a garden is not worth looking at unless it is as clean an a newly-swept floor; it in a counsel of perfection which I have no great wibh to reach. A weed is but a good plant in the wrong place; I asy a good plant advisedly, having a full faith that where Nature plants it, it fills a right place." Oh , the lensons to be got from weeds, if we would bat turn them to account!

The pasarge above cited furnishes an illustration of the strengthening faith and cheery optimism which pervades the book, and renderm it so delightful to read. The author finds always something in the garden to "lift him higher;" he owns he is not fond of frost and now, but he recognise that they have their uses, and that we might be the worse without them, and with a thankful spirit he maken the beat even of a garden in December. "To have a garden where natare and the climate do everything, and man is called apon to do little more than scratch the ground and gather the flowers and fruit, might be very pleasant from one point of view, but it would take away all that to me constitutes the real interest of gardening in itm difficultien, and even it disappointment ${ }^{\text {.' }}$

## New or Noteworthy Plants.

## DORYPHORA SASSAFRAS**

THis in a plant (tig. 6, p. 35) that find no place in Nicholson's Dictionary, nor in any garden-list that we have examined, and which we may, therefore, conclude to be rare in cultivation. It was sent to us with a requeat that we would name it , from Mr . Thompnon, gardener to F. A. Newdegate, Eisq., M.P., Weaton-in-Arden, Naneaton. Mr. Thomson also obligingly furnished with the wecimen from which our figure was taken. It forms a highly aromatic ohrub, with opposite, hortly-stalked, coriaceous, ellipticacute, remotely-serrate glabrous leaves. The flowers are shortly-atalked, solitary, or in group of three, the buds surronaded by deciduous boat-shaped bracta. The perianth is about 30 mill. (asy, $1 \frac{1}{4}$ inch) acrome, spreading, with six leathery, whitish, hirute, oblong-acute megments. The stameng are nine in namber, each with a short filament, and two amall rounded gland at the base of the anther. Anther two-celled, connective, prolonged into a long slender awn. In the flowers we examined the pistils were abwent, or very imperfect; but they are described as numerons, free at the bottom of a cap-like receptacle. Each carpel lias a long atyle, and it aingle cell containa a aingle ovale.

The plant, which would require warm-greenhouse treatment, is by no mean nuttractive when in llower, but it chief value convists in it very aromatic fragrance. It is a native of Eantern Australia, New South Wales, and Queensland, closely allied to Atherosperma, and belong to the Monimiacer. M. T. M.

[^4]Dendrobium Imprbatrix, Kränzlin (Reichenboiona, vol. ii., part zii., p. 111, t. 95).*
"This new species is very similar to Dendrobinen Augusta Victoris, Kiänzlin, and is one of the mons stately in growth of all Dendrobiams. The atem reach to a height of 6 or 7 feet. The leaves an comparatively small, although in other Dandrobas leaf of 6 to 7 inches in length by $2 \frac{1}{2}$ or 3 inchen in breadth would be considered as a rather conniderabin one. The flower-spikes rise from the axile of the upper leave of the previous year, and very ofta exceed $2 \frac{1}{5}$ feet in length, carrying from thirty to forty flowers.

It is impossible to do full jurtice to such plants in the apace at our command, but atill the plate illurtrater the charming delicacy of its blossoms better than a long description. The affivitien may b briefly described as follows:-Dendrobiam veratrifoliam, A. Rich, has shorter and broader leavet, is is much amaller, and it racemes very aeldom excead 18 inchen in length; the petals are larger, and the side-lobe of the labellam maller. Dendrobinm Mirbelianum, Gaudich, is also a maller specien, but very closely allied; it has a larger lip, the middo lobe of which is atrictly lanceolate and acaminate, and the little apur is sharply incurved. Dendrobin Augusta Victorim, Kränzlin, the most showy of thr whole section, has petals with amethyst veins; the side-lobes of the lip are very blunt, and the throw creats are frilled and denticulated not only in front, bat on the upper side. The rest of the section is ant of the question for comparison, at their petals exceed the sepals by twice their length, and also bj other essential characteristics.
"Thir fine plant was discovered in German Nor Guinea, at Finchhafen, by Dr. Hollrung, and later on was collected by Mr. Wm. Micholitz, who found it, to use his own words, 'mostly on trees overhangive the beach. Ialand it in only seldom to be fond ;' and, he adda, 'it flowers probably in March-April' The raing eeason is not sharply defined, but it generally raina most from June till October, If should be grown in sharp heat, with plenty of sute light, and after flowering receive a long, dry rett."

## Orchid Notes and gleanimes.

## THE ORCHID HOUSES AT RAMBOUILLET

WHEN visiting the fine establishment of M. Aus Dallemagne, we were remiaded that at that tim more than 150 groupe of Orchide had been trast ferred to the Bordeaux Exhibition, where the were very generally asmired. The arrangement of the houses at Rambonillet compriaen a wilte garden in the fore-part, a large central house with on both sides, and opening into it, four houses o similar size. Thir, in fact, is the plan of the estab lishment started in Brassels by the Horticultart Internationale. In the winter garden a magnificent Kentia australis epringa from a large rock-work, on which various plants are growing. The central houro is full of Catilleya Warocqueana, Lselia purpurata, scm fine plants of unusual vigour; Angracem warquil pedale, and Vanda uavis showed equally ep health.

1st houve: Importations of Cattleya, howing
*Dendrobium imperat' ix ( 9 Antennata), Kränzlin.-Cnni bus aggregatis maximis multi-articulatis late viridibusad 13 . altis ad 25 cent. diametro; foliis oblongis coriacois, 15 , longis, 6 m . latis apice obtasís: racemis maximis multifion 75 cm , longis vel imo longioribas ; bracteis minutis pediod multo longioribus basi incrassatio $5-6 \mathrm{~cm}$. loogis; lateralibus o basi paulo latiore triangulis acutis in calcar minutum curvulum connatis margine undulatie, intur medio lineari modulato acuto; petalis paulo long semitortis linearibus antice paulum dilatatis obtasis lsbea lobis lateralibus rhombeis margine laterali et anteriore cildo culatis, intermedio vix expanso fere orbiculari margine undulato crispo acuto, disco lamellis 3 a basi in mediuces undulato crispo accuto, dasco lamellis a dasi in erectas deantict intermedii decurrentibus ibique in laminas erectas puleiestim latas subito abruptas ductis, lobis lateralibus puic antier venulosis; gynostemii parte libera brevi tridentata plans antiee minute piloeula. in Reichenbachia, vol. iz., tab. 95.
masses of bads. One plant of C. Mendeli had an unusually dark lip. 2ad house: C. gigas and aurea, growing aplendidly. 3rd houre: C. Monnix and Triansi adorned the stages, and did admirably. Above the path, at in all the other houses, a triple row of hanging baskets and pots of Orchid was arranged. 4th hoase: Seedling of Cypripediam and Dendrobiam; also Cypripediams, Phalanopris, a fine Cattleya Monizo alba, a plendid specimen of Cattleya Rex and Vanda Sanderiana. 5th house: Odontoglonsums, especially crispam, un-
magne's horticultaral eatablishment. Another and tenth house is full of Cattleyas, and in reserve, in a very cool place, are Odontoglonam criapum, Cattleya and various other Orchid deatined for the approaching Congreas at Bordeanx.

In a special kiok is installed a machine worked by petroleum intended to draw up water for irrigating.

The entire buildinge are surrounded by a fine fruit garden. The property was acquired by M. Dallemagne in 1892 ; in lens than four year he has formed
in apite of the absence of the lip, are by no mean onattractive-indeed, there is an increase of delicacy and refinement reanlting from the absence of strong colour.

> Lelia alauca, Bentham and Hooker, Lindenia, t. cdixv.

The Brassavola glauca of gardena. Flowers 5 inchea acrose, fragrant, roundish in outline, stellate, segments oblong, atraw-coloured lip projecting, white, with a purplish blotch, convolate at the base,

Hig. 6.-DORYPHORA SASSAFRAS. (8RE P. 34. )
unually well cultivated. One Lælia parpurata with an extra dark lip; a very beautiful Odontoglonnum aureum. Remarkable also were the Masdevallias and the namerous examples of Cochlioda Noetzliana which, suspeaded, formed a charming arch of bloom. 6th house: Odontoglossume in excallent henlth. 7 th house : Odontoglossums, among them many excellent varieties. 8th house: atill more of O. criapum, as well as Deporidiam atroparpaream; a remarkable Cymbidiam eburneum ; a gracefal Odontoglosame cirronam, and a flowering canopy of Cochlioda Noetzlisna. In addition to these house groaped together and show. ing the cunning of the master's hand, there is a ninth house which way b3 called the cradle of M. Dalle-
s splendid collection of Orchids, which won him, at Paris last year, the prix d'homelur from the President of the Repablic. Ch. De B.

## Odontoglosstay crispux.

A correapondent sends a spike of this Orchid bearing one perfect flower, whilst four others have the parts arranged in pairs crons-wise, thus the two sepals alternate with two petals and the lip in entirely wantivg.

## Cattlafa Mendeli.

Baron Sir H. Schroder sends fowers of this variety showing the same condition of effairs at in the Odontoglonum jut meritioned. We believe the plant throws similar flowers every year. The flowers,
anterior lobe broadly orate wcute. It in a native of Mexico, and requires to be grown in a cool house as a basket plant. It fiowers in early apring.

Lerlo-Cattleya varjeneveryana, Lindenia, t. cdlxvi.

## Cattleya Habdyana $\times$ var, Lindeni, Lindenia,

 t. cdlxviii.A gorgeous variety, with deep rony-lilac segments, lip blotched with golden yellow in the throat, with the anterior lobe alightly frilled, rich carminecoloured.

Cypaipbdium Littleanom $\times$
In the current number of the Orchid Review are given a description and an illastration of a supposed nataral hybrid in the collection of Mr. H. Little between the Bornean C. Lawrenceanam, and perhaps C. Dayanum, sloo Borneav.

## Orchidg at Fair Oax Lodge.

Mr. W. A. Gillett, the owner of Fair Oak, near Eantleigh Junction, on the London and SouthWeatern Railway, is a true connoisear of Orchids, and he has got together an excellent collection of apecien and good varieties of there plants. He finds in hic able and energetic gardener, Mr. Carr, an excellent caltivator. The gardener when he came to him fourteen yeara ago knew nothing of Orchida or their cultivation, and he is at the present time an instance of a man who by perseverance and a good share of common nense has become proficient as an orchidist. It would be diffieult for anyone to find fault with the atate of the plants under his care.
On the occasion of a recent visit to this garden I found in the cool-house numbers of plants of Odontoglossom criapum, one of this apecies having two epikes, 1 yard long, and carrying twenty-five bloome; of Miltonia vexillaria in noteworthy examples, namely, one with three new preado-balbs and ten flower-apikes, carrying altogether seventythree flowers of a large size and fine coloar; O. cordatum, O. Pescatorei, O. maculatum, 0 citromum, O. haotilabium, O. polyxantham, and Phalenopais. The diaplay of Odontozlossum was heightened by flowering examples of Epidendrum vitellinum majua, E. Godeffianum, Zygopetalam crinitam, Sophronitir grandifora, and Mandevallias in variety. Plants of Oncidiam ampliatam majus and C. aphacelatam showed, as grown here, their great usefulneas as decorative nabjects.
There was remarked a capital lot of planta (aixty) of Dendrobium Phalmnopsis Schroderianum, tome of them with very dark-coloured flowera. Dendrobium suaviesimum was observed in quantity, also a flowering plant of the comewhat rare Levlia majalis, Cypripediams Haynaldianam, concolor, Parishii, Lawrencianum, caudatom, Roerlii, calurum, Warnerianum, bellatulum, and a capitsl form of niveum, form part of the collection. A plant of Calanthe Turneri nivalis was making most antisfactory growth, as was also one of C. Veitchii. A specimen of Cattleya gigae imperialis gave promise of some good flowers thortly. Robaut plante which'had been in fine flower this reason were remarked of Vanda suavis, Cattleya Monsiæ, C. Mendeli, and Lalia purparata. E. M.

## Phalezmopsis Lindzni.

From the Journal des Orchidees for Jane 16, we take the following account of Phalænopsis Lindeni, Loher. :-"This new apecies was named in honour of M. J. Linden by the traveller who found it, and who gives the following description of it: 'Folia oblonga, abido-argentea, viridi-maculata; pedunculi purparei, bracteis parvis acatis; perigonii phylla exteriora et interiora subæqualia, obovata sabelavata, obtusa, albida (vernas nervum medium subrosea); labelli tripartiti lobi lateralem nubfalcati, oblongiobtusi, veraus banin interiorem maculis aarantiacis; scutello vel callo bilobo aurantiaco maculato; lobus intermedias cordatas, rotundatus breviter acuminatue, atriis quivques purpureis, bavi albidas, medio superiori amethyutinum.'
"The folinge of this apecien renemblen a little that of $\mathbf{P}$. Schilleriana, but the leave of the former are much narrower, almont eword-haped (Gladiolès); as to the flowers, they clonely renemble those of $\mathbf{P}$. rones, but are much larger-nearly double. Farthermore, they are remarkable for the colouring of the lip, the interior lobe of which in bright smothyst, with the buee pale rose; this division is decidedly
rounded, briefly acuminate, while in $P$. ronea it is
lczenge-shaped. M, Loher noticed that no other Phalanopsic grew in the apot whence this new apecies wat taken."

## PETER COLLINSON.

Linvenus was another of the many intimate frienda and correspondents of Collinson. The great Swedish nataraliat visited England, and a life-long acquaintance between the two men was formed. The Britiah Maseum contains copies of two letters which the English naturalist addressed to Linnman, dated reapectively 1739 and 1767 (2 Add. MSS., 28,545, ff. 140, 140b), the earlier of which runs as follows: "Dear Friend, I could not omit no convenient an opportanity by my worthy friend, Dr. Dillenius, to enquire after your welfare, and give you joy on your marriage. May much happinens attend you in that state. I am glad of this conveyance to express my gratitude for the particular regard ahown me in that carioun, elaborate work, the Hortus Cliffortiamus. Something. I think, was due to me from the Commonwealth of Botany for the great number of planta and seeds I have annually procured from abroad, and you bave been so good as to pay it by giving me a apecies of eternity, botanically speaking ; that is, a name as long as men and books endure." The plant to which Collinson refers is, of coarse, the Collinsonia canadensir, which is figared in the above-mentioned work of Linnæua (Amaterdam, 1737).
The MS. department of the British Maseum contains many handred letters written by and addreased to Collinnon, who appears to have been the gaide, philonopher and friend of nearly all the celebritien, botanical and horticaltaral, of the period. There are many from the Duke of Richmond, who wae living at that time at Goodwood, and who made extenvive alterations in and additions to the gardens there. The sabject of the present sketch was a frequent visitor, and so was his young son Michael. The letters which passed between them were of the mont cordial nature ; one of them, for example, ending thus:"Adien, my dear Peter, this cruel weather [the letter was written February 16, 1747.8], patte me quite out of all patience, butt in frout, or now, wett weather, or fine, I am, honest Peter, sincerely thyne, Richmond." In another letter, his Grace remark, "The amall Magnolias aro confounded dear, butt I munt have them, tho' I believe nobody else will be fool enough to buye any at that price." Collinzon was also a frequent visitor at Holland House, in the early fifties of the laat centary. Henry Fox, the celebrated Lord Holland, father of the even more famoan Charlen James Fox, had not jet been elevated to the peerage; whatever may have been his failinga as a politician-and there can be no quention that he was an adventurer of a very quentionable, and now. happily, obsolete type-his frienduhip for Collinson was genuine. Collinion was frequently at his house; an invitation to dine, in 1750, was backed up with the plea, "Lady Caroline han a thoumand questions to ask you about flowers, and I not much fewer about plants." Another invitation in 1752 ran, "Will you dine here on Satarday? You shall be guarded home," is a very carious and interesting illastration of the dangers which attended foot-paseengers in the auburbe of London at that period-for Holland Honse was not then aurrounded by bricks and mortar, and even Oxford Street and Tottenham Court Road were country fielde.
Peter Collinson's place of basiness was at the Red Lion, in Gracecharch Street. The name of his place suggente to us of to-day a public- house ; but the fashion of numbering houses had not yet come into vogue, and, an a conuequence, all the principal shopa were diatingaished by signe. From a very early age he lived at "Peckham, in Sarrey," a very different place to what it has aince become. It wes here that he formed a very extensive botenical garden. Through his marriage with Mary, daughter of Mr. Buehell, of Mill Hiil, Hendoo, in 1724, he eventaally came into poseestion of this place. The removal from Peckham thence, however, did not take effect antil a quarter of a century, aftewards.

He himself telly ua, under date April 8, 174y, "removed from my houne at Peckham, in Surrey; for tro years was tranaplanting my garden to my house at Mill Hill, called Ridgway House," "ten miles from St, Gilen's Pound, in Holbourn." The gardens \& Peckham and Mill Hill had attained such a high celebrity that a pablication of Collinson's catalogue appears to have been called for by some of the mot diatingaished naturalists of the time; and the remon for this non-compliance with their wishes in tha given in a letter of his, dated May 12, 1756, to Lita neas:-" You mast remember I am a merchank, man of great businens, with many affairs in my head and on my hands. I can never pretend to pablinha catalogue of my garden unless I had one of your ingenious papils to digest or methodize for me."
Collinaon began early to keep an alphabetical register of the plants which he cultivated. At his death in 1768 the catalogue, which had by himself been bound ap with the seventh folio edition of Miller's Dic. tionary, paseed into the possession of his son-inlaw, John Cater, of Beckenham, Kent, and there it remained until 1809, nearly, if not quite, anknown. In the tenth volume of the Linnean Society's Trannec. tions, Lambert gave some account of it. A quarter of centary later, Lambert obtained it, with Collinaon't copies of the sixth and eighth editions of Miller, atadded with notes and memoranda by Collinon. At Lambert's sale after his death, they passed into the posseasion of L. W. Dillwyn, who privately printed, in his Hortus Collinsonianus, 1843, all them notea, \&c., snd from which it appears that Collinaon introduced 119 plants. It would be interesting to know of the whereaboats of these three editions of Miller, annotated by Collinson, although Dillwyn' exceedingly intereating and valuable excerpts doabt less include all of the notes which posenes permanent va'ue.
Collinton atrongly urged the American colonitt to cultivate flax, hemp, ailk, and wine, which led to the cultivation of these industries in several of the States. Collinson was a liberal contributor to the collections of the British Museum ; and, according to the late Robert Hant, it was contemplated to appoint him as curator of the botanical divinion, This was not carried into effect, for what reason it is not now known. Collineon died while on a rinit to Lord Petre in Eseex, and enclosed in his will was a paper importing " that he hoped he should leave behind him a good nama, which be valued more than riches; that he had ondeavoared not to live uselesaly, and that all his daya he constantly aimed to be a friend 50 mankind." Dr. Fothergill wrote a privately-printed account of his friend in 1770, the British Maseam copy of which once belonged to Sir Joseph Banks, which is reprinted in the collected edition of Fothergill's worke, 1781. The original issue of thin biography contains an exceedingly good portrait of Collinson, engraved by J. Miller; and this portrait, reduced from quarto to octavo size, with the detailh alightly altered, was reproduced by Nichols in hit Literary Anecdotes, whence the illustration given at p. 6 is derived. W. Roberts.

## COOMBE COURT, KINGSTON-ON-THAMES.

Tar groundu here (the residence of W. A. Berad Eeq.), are extensive and picturesque. They were laid out tome yeare ago by Mesurn. J. Veitch \& Sont From the terrace in front of the fine red-brick manaion may be obtained some fine landscape riefto embracing a wide atretch of the Surrey hills. Grand masses of Rhododendrone, Azaleas, and othes flowering shrabs are features here, and meen from the terrace when in beanty, they have a wonderfully fine effect. Some fine named varietien of Rhodo. dendrons are grown, apecially noticeable at the time these notea were taken being John Waterer, The Qaeen, Francis Dickson, and Lady Palmertolen. Kalmiak revel in the peaty soil, and the Rhododer: dron beds are edged with them. That handoomenn of the Berberises, B. Darwinii, flourisher here, and the plants become covered with a profuaion of the
nrange-coloured blossoms. Some beds consisting of Ssummia japonica, golden Laurustinus, and Irish H-ath, edged with Euonymus radicans, are quite remartable

Hollies were remarked at growing laxariantly, some fine specimens in front of the house moved two jears ago being specially noticeable. Some good specimens of Abie Douglasii shifed three yeari ago have also done well, making good growth. The various forms of Capresur are attaining good dimensione. Ratino porado not seem to take kindly to the gravelly sub-soil here, and some of the fine S weet Bay: were much cut daring the past severe winter. Cedra Doodara finds a congenial home here, as do the Oake, Elmp, and Piceas. On the lower side of the grounde, abatting on to Coombe Lane, a long line of closelp-trimmed Limet gives an air of noder and geatnera cbaracteriatic of the whole place. A lake bordered by aitable trees is a very pretty and "reatful" feature.

Some bold mixed beds of Abatilons, Colens, Zea japonica, Ricinus, Caraations, \&c., in proximity to

Applea and Peara, principally as pyramide promise good crops, the root-pruning to which the treen were subjected two years ago having had a beneficial effect.

Veitch' Extra-early Forcing Cauliflower is ex. tremely early, and very dwarf. Sown the middle of February, cutting has been going on aince May 28. Pea Veitch's Early Selected was ready for picking on June 3. A fine breadth of 500 plant of that old but good Cabbage, Cattell' Reliance, stood the winter so well; ready irat week in April.

Amongat Potatos, Myatt's Ashleaf is much eateemed here, at is that fine-constitutioned variety, of excellent quality, 8choolmater.

Pea are grown in 100 -feet rowt, as a large family has to be upplied, the principal varieties grown being the old bat finely-flavoared Ne Plu Uitra, Veitch's Perfection, William I., Main Crop, Criterion, and Dachess of Albany.

A concluding note may be found in recording the fact that the whole place is well-managed by the gardener, Mr. Springthorpe. J. B.

Fig T. A COMPOSITE PEACH: PART PEACH, PART NECTARINE.
the manaion will conatitute attractive features a little later. The calture of the usefal and beautuful herbaceon plants is being taken ap. In the conservatory attached to the residence the usual foliage and flowering plant for decorative parposes in such atructures were in remarkably good condition.

In a range of houses 100 feet long in three compartmente, Pine-apple Nectarioe was carrying a good crop. Rowes on a back wall of this division do well in apring, exceptional top-light being obtained.

Black Hambargh and Masat of Alexandria are the favourite Graper grown, und the crop: are all that can be deaired.

Two npan roofed bouses, 130 feet in length, contain some well-fruited trees of Dr. Hogg, Royal Grorge, and Early Lonise Peachep.

The best forcing Surawberry is found in Augaste Nicaise, the picking commencing on April 1. White Ischia and Brown Tarkey Figa in pote give promise of gond fruiting. The favourite Melons are Countess and Frogmore Selected; Tomatof, Ham Green, Frogmore Selected, and Parfection.

In the kitchen garden, a fruit-wall some 300 yard in length, is quite worthy of note. The Cherrytrees on this wall are in the best of health, and reaching to the top of the 9 feet wall, the principal varieties grown being May Dake, mall, but carrying a good crop; Bigarrear Napoleon, Elton, Morello, Frogmore Bigarrean, Black Eigle, Old Bigarreau, and Eurly May, fruite of the latter being gathered early in May. On this wall some of the best varietie of Piams, Peachen, and Peary are also grown. Peart are, however, a carce crop this year.

## EARLY PEAS.

Carmfur, fair, and comparative triale year after year have convinced me that wo have too many varieties of Peas in caltivation. Taking the roundseeded early Peas, auch as Eclipse or Earliest of All (practically the same Pea), Carter's Lightning, Day's Sanaise, and Sangater's No. 1, the two former come in together, and the two latter a week later. If I had room for only one of those named I would grow Eclipse. As regarde the first early dwarf Peas, all of which, by the way, have wrinkled ceed, and are consequently of superior quality, William Harat, Chelsea Gem, and American Wonder come in almont together. The two former, however, having longer and quite as well-filled pods, are preferable to American Wonder. The real difforence between William Harat and Chelsen Gem in that whereas the weed of the former is blue when dry, the latter is white. When growing there is no appreciable difference, and both are firat-rate Peas, particularly uicable for early borders or framen. The early Pea (wriokled variety) that I prefer to all othera is Exonian, and for the reaton that it is remarkably early, coming in with the earlieat wection, is a good cropper, the pods being tightly packed, eight, nine, and ten Peas being a common number of seed in a pod. The Peas are of a dark green colour, and the flavour is excellent. In flavoar, it revembles the varietie Yorkahire Hero and G. F. Wilson. To poseens, as it does, the three attributes of earlinens, pridactivenens, and flavour, atamps it, in my opinion, one of the besto

Coming to second early Peas, two varieties atand out prominently, Gradus and Daisy, the former introdaced by Laxton and the latter by Carter. For earliness, Gradus excels Daisy, and, when true, it is really a grand Pea. It in a good bearer, has fine large pod of the Dake of Albany type, and in of fine flavour. Daisy ( $1 \frac{1}{2}$ to 2 feet) is one of the coming Peas; a wouderfal bearer, the pods coming in pairs, and they are large and well filied; it is, moreover, of compact habit and comen among the first of the aecond-early rection. Dr. Hogg is a good old necond-early Pea, and hold it place pretty well. William I. ia so apt to "sport" that growers are getting tired of checking ite waywardnene, and are inclined to drop ite cultivation. Gradus is alto atid to have this falt, but I do not think that it deserves a bad name. A stock of it sent out this meanon in packets was as full of rogues at it well conld be, but I have seen another atock which wat almost free of them. Meiars. Dickaon, of Chester, have a good early wrinkled Pea in Harbinger, which is somewhat after the atyle of Exonian, but it has not the deep colour of that variety, nor is it eo early by one week. Notwithatanding its pale colour, it is a good Pea.

In a trial of Pean, they must, to arrive at accurate resulty, be all nown on the ame day, on the same plot, and, from the beginning, be treated alike. To sow one variety on a border this year and another variety next year, is no trial at all. It is worse than useless, for often it in misleading. A. $H$.

## VARIATION.

This fascinating aubject receives a curiou illutration in the apecimen here shown (6ig. 7). Mr. Tborne, who kindly sends it, described it as Early Dagmar Peach, with a atripe or band which is that of a Nectarine. Uccationally we see Peachen and Nectarines on the aame bough, and an illatration of such an occurrence was given in our columns in 1891. When this phenomenon wat first observed, the narrative was received with incredality. An illuatration of this is shown in the Kew collection of drawings, where is preserved a coloured drawing, accompanied by a document formally attested by a number of botanical and horticultaral celebrities. Since that time aimilar occarrence has occasionally been noticed, not only in Peacher, but in Applea and other frait. Darwin, in his Animals and Plants under Domestication (1868), vol. i., p. 341, mentione neveral cases of the kind called from borticultaral literature. The earlieat case on record, it appears, is one stated by Peter Collinson, whose life forms the subject of a notice in the present innue; and Sir James Smith in $18: 21$ was the firet to record the occurrence of frait partly Peach, partly Nectarine, in character. Similar amalgamation are met with in Oranges. We have ouraelves seen a fruit half Orange, half Lemon; wee also Darwin, loc. cit, p. 336.

## PLANTS IN FLOWER in the royal botanic garden,

 EDINBURGH.Michelia foscata, perhape better known ander the generic name of Magnolia, is now flowering very freely in the temperate-house, the delightfal fragrance of its flowers being detected as soon as the house is entered. This fragrance should recommend it to a place in every greenhouse. The plant in about 8 feet high, of a shrub-like habit, with plenty of dark evergreen foliage. The axiliary flowers are of a light purple colour, the fienby corolla soon dropping, but they are prodaced for a long pariod of time. It is a native of China, and has long been in cultivation; it is eastly propagated, and growi in rich loamy ail. Young planta flower freely.

Orthosiphon ataminens is a native of India, Malaya, and ame other tropical countries. It flowers are very sttractive, at the present time the mont conopicuous part being the long filament and atyle that p:oject about $\frac{1}{2}$ 'nch beyond the bilabiate cocolla.

The plant is compact in habit，with herbaceous stems some 12 or 18 iaches in height，with ovate deeply toothed lesves；the inflorescence forms crowded racemer，at the apex of the branches． Plants struck in spring form bashy flowering ataff for atove decoration from May onwards，through the summer．（See Gardeners＇Chronicle，1869，p． 941 ）

A plant of Alberta magna in now flowering here for the first time．It is of a atiff erect habit，with opposite，ovate，coriaceous leaves．The inforeacence， which comes in the form of terminal panicles，consiats ci bright crimson flowers，the tube of the corolla being aboat an inch long，and lasts in a perfect condition for wereral weeks，and if the plant can be flowered freely it alould proves welcomeaddition to the greenhonse． After the corolla has dropped，two of the calyx lobes leagthen and form scarlet wings to the fruit．Although it has for several years been in cultivation，the firat record of ite flowering in this country was at Kew in 1893.

Tussacia pulchella is a Gesneraceoun plant，long ago introduced from the West Indien，and is a member of a small genus of four or five apecies，only $t$ wo of which are said to have been introdnced． The apecies under notice in a plant growing to about I foot in height，with a herbaceons atem and large opposite－ovate leaves，the margins of which are irregularly eerrated，and of a light green colour． The showy flower are produced apon axillary inflo－ rencences，which generally bear five flowers．The calyz is red，and about half the length of the corolla，which in light yellow in colour． When at reat，water ahould be aparingly afforded， but not entirely withheld，or the rhizomes may be dried up．They ahould also be wintered in a warm－ house．A figure may be seen in the Botanical Magazine，t． 1146.
Cacti in flower．－Several of thene intereating plants have been daring the past few weeks，and are， flowering at the present time in the succulent－honse． Two very pretty yellow－flowering plants are Echino－ cactue Ostonis，E．tricuspidatua and E．tabularis，thene are particularly bright，the atyle and atigma is of a dark parple coloar．The laat continues in flower for some time，opening in the morning and closing at night．Echinopsie triumphans has a deeply－ridged atem，rather eparsely dotted with apines and large pinky－white flowers，which do not possens a very agreenble perfune．Large numbera of the Mammil－ larian are in bloom，and thene are also attractive when in fruit．There are now in flower，M．Dillenii， M．exeudans，M．Staberi，and M．glanca，all bearing numerous dark red flowers ；M．Wildiana，with ita hooked spines is another desirable species［？］，and bears mach lighter flowera than those mentioned above，while M．glomerata has quite jellow flowers． Although many of these laat cannot be called showr plants when teen in quantity，they are alwaje in－ teresting，and deserve more attention than they get at the present time；while with the Phyllocactas with which so much hat been done in their hybri－ diantion，that none can fail to admire their large and brilliant flowers．R．L．Harrow．

## NOTES ON THE HARDINESS OF SOME OUT－OF－DOORS PLANTS AT BELVOIR CASTLE．

In the following liste of plante the names of those under the headings＂killed＂and＂merionaly injured＂ are given in full，and in the list of survivors only thone are given which are likely to be of interent to readers of the Gardeners＇Chronicle for that reason． Many planta doubtleas escaped irjary owiag to the elevation of the gardens，and the perfect drainage consequent on that elevation．The height varien from 360 to 460 feet above nea－level．The shelter afforded by the wood sarrounding the gardens was alao of great use in protecting the plante，sad eopeci－ ally noticeable was its effect in preserving Portagal Laurels，of which there are large numberi，many of the apecimenn being from 25 to 30 feat high；and Where these are situated in the wood iteelf no injary was done－whereas in exponed places this shrut has
lost most of it leaves，and some fow the tips of the ahoots．Those plants marked ${ }^{*}$ were growing in the Dachess＇Garden，which is situated on the aide of a hill 100 feet in height；this hill has a curved outline，and is open only to the outh－east，much of the sun－heat being therefore retained，and the garden rendered warm during the night．

The greatest amount of frost registered at the kitchen gardens at Belvoir，wa：$-3^{\circ}$ on a Glaisher screen，$-8^{\circ}$ on the grass，on February 8 ；the mean temperature of February was $27^{\circ} .26$ ，the mean of daily maxims in the sun for the ten day， February 5 to 14 ，during which the frost was most severe，was $79^{\circ} .40$ ，and during that period we had 62 hours 30 minutes of sunshine．I have no doubt this helped many of the plants considerably； many dwarf plants alao derived much benefit from the 4 inches of now which covered them daring the time the frost was most aevere－and the advantage derived from this covering wan shown by the Let－ tuces planted along at the foot of aouth walls，where the now had melted，being killed，whilat those on a west aspect，where they were all the time covered with now，survived．The frost penetrated the earth to a depth of 8 inches，and a heap of soil which laid loose above the arface， 18 inches．The ice on the lake wan 8 inches thick．This frout was much more evere than that of the winter $1860 \cdot 61$ ，when the loweat temperatare recorded here was $-1^{\circ}$ on a Glaisher acreen，and $-5^{\circ}$ on the grasi，this wat on Dec．25， 1860.

ROTATION OF CROPS．
Plant．food taren up．－At the commencement of this nubject，see May 4，p．550，it was pointed ouk that although many different rotations are adopted， they may for the most part be considered as litth more than local adaptationa of the ayatem of alter nating root－crops and legaminous crops with the cereal grains．Thus there are rotation of five，sing even，or more years．But these variations are，il most canes，only adaptations of the principle variations of soil，altitude，aspect，climate，marketa， and other local conditions，and they consist chiefy in the variation in the description of the root cron and perhaps in the introduction of Potator，in grom． ing a cereal，or it may be more than one cereal consecutively，in the growth of some other legre minous crop than Clover，or the intermixtare with the Clover of Grass seede，and perhaps in the exterb． aion of the period allotted to this element of the rots． tion to two or more years．

It is true，also，that under any specific rotation， there may be deviations from the plan of retaining the whole of the root－crop，the straw of thin grain crops，and the leguminoas fodder crop on the farm，for the production of meat or milt， and，coincidently，for that of manure to be retural to the land．Bat it is also true that，when underth influence of pecial，local，or other demand－proxivity to towns，easy railway or other communication，ad so on－the products which would otherwise be we tained on the farm are exported from it，the impat of town or other manures is generally an enentid condition of auch practice．Indeed，this aystem of free anle very frequently involve foll compenation by purchased manures of some kind．In our om country，anch deviations from the practice of merdy selling grain and meat have been much developed in recent years；and they will doabtlese continue increase under the altered conditions of our agio culture，dependent on very large imports of guitir increasing imports of meat and other products feeding，and very large imports of cattle－food nl other agricultaral produce．Already much men attention is being devoted to dairy prodacts，not only on graas farme，but on those that are mainly arally and there will doubtless be some，bat probably by mo means so great an extention as some suppose，in th production of other amaller articlea required by twin popalations．
It in further true，though the remark applies is very limited degree to our own country，that then are other deviations which have more the charater of exceptions to the general rale of rotations，andil at the introdaction of Flax，Hemp，Tobacco， other so－called induatrial crops．Bat in these curt as with Potatos，the giowth involves apecial + spets diture for manare，instead of conservation of it Indeed，the inducement is the high price of product，rather than the maintenaace，or the 1 is provement，of the condition of the land for fatal crop．

Still，at such deviation from segular rotatiol practice as have been referred to $\mathrm{d} r$ ，as hat bet uaid，generally involve more or lens compensation to manare from external sources，attention is confur for the purposes of illuatration to what mas called the self－apporting ayotem，and to the aisply four－course one which has been selected for invel gation at Rothamsted．
Brief reference only can be given to come of more important mineral constituente foand in different crops of the four－coarse rotation．
Of phomphoric acid，the cereal cropt take ap much as，or more than，any of the other crops of rotation，excepting Clover ；and the greater portiver of what they take ap is lost to the farm in the is is able product－the grain．The remainder，the lef the atraw，at well as that in the roots and the $\log ^{0}$ minout cropt，is apposed to be retained on farm，excepting the nmall amount exported in of and milk．

Of potash，each of the crope take up very more than of phomphoric acid；but mich
potash than phoshoric acid is exported in the cereal grains, moch more being retained in the straw; whilat the other products of the rotatiouthe roots and Lepominonx-which are also supposed to be retained on the farm, contain very much more potah than the cerealr, and comparatively little of it is exported in meat and milk.

Of lime, very little is taken ap by the cereal crope, and by the roots much less than of potash ; more by the Leguminozx than by the other crope, and, by the Clover enpecially, sometimen much more than by all the other crops of the rotation put together. Of the lime of the crops, however, very little goes in the saleable producte of the farm under tha conditions apposed of a self-supporting rota tion. There is, however, frequently a considerable lons of lime in land drainage.

The interpolated cropa of rotation-the roots and the Leguminorm-take up acarcely any silica; but the cereals take up a very large amount of it. Indeed, the large mount of silica taken op by these crops when grown under ordinary conditions, ia at characteristic a chemical phenomenon of rotation as in the very large amount of lime taken ap by Clover and other Leguminosæ. Very little ailica, however, is lost to the land in the anamed saleable prodacts.

Although the eventaal loss to the land of mineral constituent ir , in a self-supporting rotation. comparatively so amall, the very fact that the difforent crope require for their growth, not only very different amount of individual contituente, but require these to be available within the soil in very different conditions, both of combination and of distribution, points to the concluaion that, in any explanation of the benefite of an alternation of crops, the position, and the role of the mineral constituent must not be overlooked; and the less can it be so when their connection with the very important element-the nitrogen of the cropm-is considered.

As to the nitrogen, it has been aeen that, although very characteriatically benefited by nitrogenou manures, the cereal crops take up and retain much less nitrogen than any of the crops alternated with them-in fact, the root crope may coatain two or more times as mach nitrogen as either of the cereals ; and the legaminous crop, especially Clover much more tban the ruot-crops. The greater part of the nitrogen of the cereals is, however, sold off the farm, but parhapn not more than 10 or 15 per cent. of that of either the root-crop, or the Clover, or other forage leguminous crop, is sold off in animal increase or milk. Tane, most of the nitrogen of the atraw of the cereals, and a very large proportion of that of the much more highly nitrogen-yielding crops, returas to the land as manure, for the benefit of fature cereale and other crops. Indeed, it it, at a rule, only a comparatively amall proportion of the very much increased amount of nitrogen obtained in rotation compared with that in continuous cereal cropping (chiefly due to the interpolated crops) that ia lost to the land in the asleable product.

1s to the source of the nitrogen of the so-called restorative crops," it has been shown that certainly in the case of the roote it is not, as has sometimes been asaumed, thet nuch plants take up nitrogen from the air by virtue of their extended leaf-surface Both common experience and direct experiment demonatrate that they are as dependent as any crop bat is grown on available nitrogen within the soil, which is generally supplied by the direct applica tion of nitrogenous manures-natural or artificial Uader such conditions of supply, however, the root crops, gross feeders at they are, and distributing a very large amount of fibrous feeding root within the soil, avail themselves of a much greater quantity of the nitrogen supplied than the cereals would under aimilar circumatances, this result being partly due to their period of accumalation and growth extending even monthe after the period of collection by the ripening cereals has terminated, and at the season when nitrification within the soil a the most active, and the accumulation of nitrates in it is the greatest. Latily, foll supply of both mineral constituent and nitrogen being at command, these crope antimilate a very large amount of
carbon from the atmosphere, and prodace, besides nitrogenous food-prodacts, a very large amount of the carbohydrates-sugar, as respiratory and fatforming food for the live-atock of the farm.

The atill more bighly ditrogenoas leguminous crope, on the other hand, although not characteristically benffited by nitrogenous manurfa, nevertheless contribate much more nitrogen to the total produce of the rofation than ady of the other cropa comprised in it. It is aleo certain that, at any rate, a large proportion of the nitrogen of these crop is obtained from the woil and ab-soil; though recent inventigations beve proved that some of their nitrogen, and sometimes much of it, may be derived indirectly from the free nitrogen of the atmonphere, breught into combination under the influence of micro-organiam within the nodales on the roots of the plante.

Bat independently of the benefite arising from the difference in the requirements and results of growth of tha different crops, of the iocreased amount of manure available, and of the increased aale of highlyvaluable animal products, there are other elemente of advantage of conaiderable importance. For example, with a variety of crops, the mechanical operation of the farm, involving horse and hand labour, are batter distribated over the year, and are therefore more economically performed.

Last, but by no means least, the opportunitien which alternate cropping affords for the cleaning of the land from weed is a prominent element of advantage. J. J. Willis, Harpemilen.

Forestry.
the natural regeneration of WOODS.
Few branchea of Britioh foreatry probably are more neglected than the restocking of mature woodland by means of aelf-aom seedlings. Although it occure more or lest in every seed-bearing wood, yet we seldom, if evar, find any syatematic methods adopted to bring it about in a uniform and antisfactory manner. It requirea, of course, a certain amonat of akill and jadgment on the part of those who regalate the management of the wood previous to, and at the felling of the old crop; bat beyond this, the eatablishment of a healthy crop of young trees by this means is as simple as raising a farm or garden crop by artificial sowing. Jast as a seedbed is prepared in the case of the latter, so mast one exist for the reception of the seed which falle from the parent trees, and this is the requiaite which is chiefly lacking in our woods.

A good forest seed-bed prepared by natural causer, differe with the species which are to occapy it. For the proper development of a seedling into a sapling, the sead mut germinate upon matter which will sapport the plant a'ter ite atock of renerve material (atored up in the cotyledons or endosperm) has given out, and it mast also be exposed to sufficient air and light for its leaves to carry on their work properly. In dense woods, especially when composed of shadebearing species, a thick laver of raw , or partially-decomposed humas, existp, which is not anfisiently compact to retain moisture for any length of time, nor has it auch an intimate connection with the coil beneath which would set up capillaritp. Uader these circumetances, a aeed falling upon the foreat floor may germinate, but invariably perishes from insafficient moistare and natrimant in the course of a few days. To effect the decomposition of this inert matter, the annual leaf-fall mutt bs checked, and an and wind allowed to act upon and hasten the decomposing process. For this reason, the felling of a wood which it is intended to regenerate naturally, is ually performad at two diatinct periods. Two or three yeara before a seed crop is likely to occar, what is known at "preparatory felling" is made, which removee about one-half, more or lenf, of the trees, and greatly reduces the leaf-canopy. This felling has a twolold object-the reduction of the humas-
layer, an already mentioned, and the expoure of the crown of the ramaining trees to the sub, of at induce and farour the formation of flower-bade and thas briag about a plentifal crop of seed. After the latter occars and falls to thaground, a second felliog is made in order to farther lighten the canopy for the benefit of the seedlinge which appear in the following apring. Tae extent of this felling depend upna the requirements and nature of the seedlinga. Ia the care of shade-bearers, wach as Beech or Horabeam. anflisent trees may remain to form a light but fairly regular abade, as the former of thene species is very mencitive to late frosta, and the meedlinga are easily destroyed during the firat year. Where the parent trees posess comparatively light crowns, a Osk or Aah, the ame proportion may remain with out interfering with the seedlinge, for this canopy prevents the drying-up of the ground and baking of the surface, and thas favours the growth of the seedlings. A'ter the satter are fally established, the remaining trees can be gradually removed, and the blanks which occur filled ap by tranoplanting aeedlinge from the thicker parta.

In the case of Conifers of the Pine genay, heavier felling at the time of the eed crop is necenary, at Pine seedlinge require plenty of light, and the preparatory felling is also of importance, as unless the radicles come quickly in contact with the mineral soil, a large proportion perish. With the Scot' Pine, for instance, fifteen to twenty trees per acre are amply sufficient to provide the necessary seed, at the winged form of the latter enablea it to be carried long diatances by the wind. Tae development of this wing upon fine seed furnisher an interesting field of speculation for the evolutionist, and those acquainted with the peculiarities attending the nataral regenerasion of this tree are able to recognise the enormous advantages which this wing confers upon the seed with regard to it distribation and conveysnce te suitable localitien for it germination. Whatever the reason may be, the fact remaint, that both the germination of the seed and the growth of the seedlinge occur most readily on niten which have never, or at least not recently, borne a crop of timber. Oa heathy moors, whether these be wet or dry, peaty or gravelly, this specien quickly entablishes itnelf, proriding a few eeed-bearing trees are within reasonable distance, and the heather is not too long and rank to provent the seed reaching the noil. Bat ander its own shade, or that of other trees, the Scots Pine faila to reproduce itself in a astisfactory manaer; hence the necesaity for mean of locomotion other than those anally provided in the case of mont other tree apecies.

The real necret of anccone in all cases of natura reproduction is the total sappression of undergrowth. Whether this conviate of grase, brambles, or coarse weeds, a regular crop of any kind of seedling is imposnible, and with eome apecie the germination, ander such conditions, of a seed becomes a rare occurrence. This suppression can only be effected by maintaining a clone and unbroken leaf-canopy for several years previous to the preliminary fellinge. With light-demanding apecie a dense canopy is difficalt to obtain, unlest a mixture of some shadebearing tree, usually Beech, is introdaced either at the time the crop is planted or later on, according to circumatances. By auch mean a clear field it left for the weed of the legitimate crop, which are able to germinate and make a fair growth before waed and coarte grasees get posseasion of the soil.
Tae chief obatacle in the way of nataral regeneration, or the adoption of measures for securing it, is game cover. We have never been able to underatand the precise difforence between a crop of young treen from five to twenty yearm of age and a crop of nettles, brambles, bracken, \&cc, so far at their value an game cover for pheasants goes, eapacially when, as in invariably the case, a fair proportion of the latter are mixed in with the former. But this is a matter of which the layman in not qualified to judge, any more than of the character of the hand-reared pheasant. In the eyen of the inexperienced this bird appear to reaemble a rather shy barn-door fowl Fith just eafficient fear of man to keep twenty yards
or so out of bis way. Bat we are given to understand that this bird is so painfally shy that the cracking of a dry stick, or the occasional soand of the axe is sufficient to drive it "out of the cover" (whatever destination that may be), a coarse which it seems loth to adopt before an army of beaters. A. C. Forbes.

## ELMET HALL, LEEDS.

A view of the picturesque rockery and other parts of the garden at Elmet Hall, the property of J. H. Kitson, Esq, was given in the Gardeners' Chronicle, April 28, 189t, and the issue of May 5 contained some account of the pretty and extensive gardens which are managed by Mr. T. Bonsall, the remarks on that occasion relating chiefly to the gardens ontdoors. A recent visit found the eatablishment beantifal as ever, the rockery bright with large tufts of pretty alpinea and other herbaceoas perennials. Some large patches of the lovely dwarf blue Myosotis rupicola, the yellow and purple Arnebia echioides, of blae Gentian, apecies of Edrianthau, Androsace, Lithospermum Gastoni, snd other plants of similar class being specially beantifal, and the herbaceous plant-garden for tall and strong growers formed on the site of the old kitchen-garden, a bewildering mask of varied colours. From the mansion beautiful views of hill and dale open up on all niden, and care is taken to prenerve the continnity of the scenery from the very walls of the house to the raniohing point, the intervening apace of garden and pleanare ground being arranged so an to merge into the diatant landscape, and this object is mainly attained by keeping a large unbroken expanse of green lawn around the house, and making no provision for flower-beds containing Pelargoniums and other thinge aacally denominated bedding plants, which are often allowed to mar what would otherwiee be pretty views.

## The Orchids.

In the glasmoares a collection of Orchids was commenced cme time ago, and under Mr. Bonsall's akilfal management the ventare being nuccenful, and the floweri found opecially adapted for catting for ase indoors, addition have been made, antil now a large number of plants of showy apeciea are remarkably well grown, and occupy places in most of the plant-hcusen, as well an in thone devoted entirely to Orchids. Perhaps the greatest success hae been attained with the cool Orchids, the range used for their cultare being at the present time filled with some handreds of atrong plants of a good strain of Odontoglonsum crispum, chiely establibhed plantu, though there was a batch of importations of the present year, which are making satiafactory progress. Some few other apecies of Odontoglossum were in flower ; bat $U$. critpum, in its various forms, is the favourite here as in mosto other gardens.
The Melon-house, with its good crop of fraits, is utilised for growing Dendrobiam Phalmopopia Schroderianum, of which there are many plants, and other apecies requiring a high temperatare, and some of then were in bloom. Here, too, Calanthe Veitchii and others were being grown in quantity.
In the next, an intermediate-house, there was remarked a fine plant of Coryanthes maculata suspended at the entrance, the two pendent upiken bearing each three of the large fleshy and singularlyformed, light orange-coloured dowers; the plant, which is in a basket, was growing luxariantly. In the same house in flower were fine planta of the bright Oncidiam ampliatam majus, the rose and parple 0 . Lanceanum, O. Cebollete, O. flexuosam, Peristeria elatsthe Dove Orehid, Cypripedium candatam, C. philippinense, C. Lawrenceanum, and other Cypripediama and Utricularia montana. In the apan-roofed range wan a fine show of Lxelia purparata and L. tenebrosa, with a plant or so of the true L. grandis, some Cypripedium bellatalam, well-flowered plante of Dendrobina Bensone, D. Pierardi, and several handsome Odontoglossum citrosmam. Here nome of the plante were noticed to be mandiag on mamall brase tara-table, which have the merit of posseasing
holders for water in the lower division, the upper half on which the plant is placed, and which revolves easily, allowing the plaat to be readily turned round for examination or to alter ita position from time to time as may be found necensary, in order to cause it to grow equally on all sides. The need of some such an arrangement has long been felt by Orchid-growert, and some rather heavy revolving irous atands are in ane; bat these brass ones, invented and patented by Mr. Kitson, are ar long way in advance of former things of the kiud, and apparently difficalt to improve on.
In the next honse, the show of flowers was chielly farnished by Dendrobiam, Cymbidiam, and Masdevallia Harryana. There were in bloom a lot of Lycaste Dappei, some L. aromatica, covered with yellow flowers ; a fer handsomely- flowered plants of Rodriguezia venusta (often called Barlingtonia fragrans), the pretty Phaius Owenianue, Nanodes Medusæ, Maxillaria Sanderiana, 8cc.

## Miscellaneous.

In the large atove, a few Phalænopsis were auspended among the Nepenthes; and of the latter, \& specimen of Nepenthes Curtisii with two stems, displayed a carious diasimilarity in the form and colouring of ite pitchers. The basal ones are of the ordinary form, and profasely blotched with dark red; the apper ones more slender, and perfectly green, without spotting. Some other good specimens of Nepenthes were N. $\times$ Mastersiana, which is undoubtedly the best of the N. sangainea clas, and a favourite everywhere ; N. R\&ffesiana, and N. Morganix. Also in the house were some well-flowered specimens of Clerodendron, Eacharis, Masa Paradisiaca, fruiting; and other showy plants ; and on the roof Aristolochia elegana, Gloriosa superba, and Stephanotis floribunda; at one end being a collection of Stanhopeas which are very healthy and in good condition to flower.
Pasaing through one well-cropped vinery we noted large bushen of Rogieria gratinsima covered with Howers, and a quantity of Streptocarpas yielding a profation of Gloxinia-like blooms. In the Camelliahouse some Lilies were flowering, and in another vinery were Ferna, Palmp, \&ce., and a nice diaplay of Gloxinias. This lofty old-fashioned vinery range has the apper part oncloned, and fitted with ntaging and walk, the apper part being now used for growing decorative flower and foliage plants. Another range had a quantity of Tea Rosea in pots and planted out; and other house were filled with amall Crotons, Dracænas, Ferns, \&cc., such quantities of which are continually in demand that Mr. Bonsall must exercise considerable skill and forethought in preparing the sapplies in different stages, sach as are in the Elmet Hall Garden. J. O'B.

## The Week's Work.

## THE ORCHID HOUGEs.

## By W. H. Watre, Orchid Grower, Burford, Dorking.

PLATYCLINIB FILIFORME AND OTHERB.Amongat plants now in flower, Platyclinim filiforme may be connidered a gem, it alender drooping racemes of small golden-yellow flowers being especially stractive. The flower-atike are produced from the centre of the young breaks, which at this particular time are only partly developed; it is, therefore, necenary that the plant should have copious aupplies of water afforded it antil the pseudobulbs are matured. Overhead ayringing is not advisable while the plant is in flower, but the leave whould be sponged instead. After the flowers fade, the plant should be placed in a hot, moist house, and be thaded from bright anshinel The pring-fowering P. glumacea, and it variety, vallida, flourioh under nimilar treatment, but now that growth is completed, they hould be taken out of the warment house, in which they had been hitherto, and placed in a ahady part of the intermediate-house, there to remain till growth recommences. While at rest anficient water hould be affurded to preserve the bulba and leaver in a plamp condition, frequent ayringing of the wadernides of the foliage to ward off the attack of insect pests, being carried out.

MISCELLANEOUB.-A sweet-scented and preh dwarf-growing Orchid now in flower, is Trichoce. tram tigrinum, whose caltivation is easy when th plant is auspended in a shallow pan on the shady of the hottest house, using a very small quantity peat and sphagnum-moss, for if the roots are mit covered with compost they are apt to quickly deots and the leaves to pot in a similar manner to $O_{\text {is }}$ cidiam Lanceanam. The rare Obcidiam gattaba should be grown under exactly the ame condition both pecies while at reat requiring bat a and quantity of water at the root to keep their ham plamp.

PACHYSTOMA THOMPSONIANUM. - This another lovely little pecies that is now in blom and its flowers, if preserved from damp, will lew considerable time. It is a species that necoul admirably in a shallow pan, hung up close to th roof-glase; and it $r \in q u i r e s$ almost the same kidit treatment as the deciduous Calanthes, bat m chade than those. While in flower very water should be afforded, and when at rat tit plants way be exposed to a good deal of andijt and only juat eufficient water afforded to prem the shrivelling of the pseado-balbs. At all tin jadgment is required in watering the plant, the lidh being very liable to decay. The rare Ealol goinerni is ehould be treated in the same was.

CATTLEYA SPECIOSIB8IMA, C. LAWRENCEMI C. SUPERBA, AND C. SCHILLERIANA, DO mencing to grow, should be placed in more min growing and flowering them, it is necensary, if th apecimens are large, to stand them on inverted poly thus bringing them up towards the light, sull examples being anepended near the roof. Cath apeciosissima should not be repotted at this tul but soon after the flowers fade; but any of the ot varieties named may be repotted. Daring repotim or surfacing, care ahould be taken to make the phen ting material very porous, so that the material, mi the plants are growing, will dry quickly, cow quently stand in need of frequent applicatiom water. When watering any that are in full grom afford enough even to waturate the entire compost, and afford no more till each plant ne becomes properly dry.

## THE KITCHEN GARDET

By Johi Lambert, Gardener, Powis Cancle, Whaty
MU8HROOM BED8.-Horee-droppinge mes again be collected for making Mashroom-bedn in cover. The produce from these beds will follor from the last beds out-of-doors. If Mashroomi plentiful, and likely to be $n 0$, there is no neda for haste in the matter of preparing materiale. stable-litter should have most of the long shaken out of it, and what remains should be nim together and tarned over every fourth day, aprai it out in a layer about 1 foot in thicknest, 10 dinsipate some of its moistore and ranknest. litter from horsen fed with grasm, Vetchea, ? Clover, Furze, \&cc., in considerable quandits is of any use in Mushroom cultare.

BRUBSEL8 8pROUT8.-Another planting of usetal vegetable should now be made. Thete p will not grow oo tall as earlier plantinga, contrary chey will be aturdy and short-legg calcuated to withstand the severity of the A scin later planting may be pat out in abo weeks; these will give the latest pickring apring, and produce amall, very solid aprona.

Broad beans.-The latt sowing for the may be made about this date, preference bell, to early poddera, as Mazagan and Beck Green Gem. All of the earlier sowing ficient of tall growert, should be copp. The ficient pods are ste to form a crop.
Beans for exhibition should be thinned, learin the more promising one ; and syringe the occasionally in the evening with soot-wats ing the atems some kind of apport if they weak to atand erect.

GARLIC AND 8HALLOTS may be lifted tops show signe of decaying, spreading the thinly in the an to dry; and when dried, clean off the woil that adheres to them, them in tore.

LEEK8.-The present is a good time to pla main crop of Leeke. I alway plant two trenches, like thone made for Colery, in a trench. So cultivated, they are
as fine if dropped into holes made on the flat, partly filling up the holes when planting the Leeks with fine soil. Afford the plants a good watering, to settle the woil about the roots. The holes will be quite filled ap as time goes on by the hoeing that the land will receive. Those in trenches will be moulded up on the approach of winter.

PEAB.-The last sowing of dwarf late and early Peas ahould be made at this date ; and then, if no early fronta come to cat them off, a few dibhes of green Peas may be obtained at a very acceptable time. Afford the sowing a sheltered, warm sitaation.

## THE FLOWHR GARDHN.

## By Bailey Wadds. Gardener, Birdsall Gardens, York.

FLOWER BED8 hould be kept neat and clean by removing decayed leaves, and the old fowering truses of Pelargoniame, \&c. Edgings of Cerastium tomentosum, Ivg-leaved and Mangleai Pelargonium, \&i should be nestly pegged out as soon as they require it, so that they may quickly form a good edging. The flower-spikes of these and other variegated varieties ased for edging should be kept pinched off. Calceolariss and Lobelias should be kept thoroughly watered as long as the drought continues ; and conniderable care will be required in watering, ataking, and tying tall-growing ab-tropical plants that are used as backgrounds to clumps. The how varieties of Diblias should have the lateral shoot taken out, and the principal shoots thoroughly secured to sticks. Mulch the bed well with manure, and give liberal supplies of water. Earwige are very troablenome, and quickly deatroy the young growth and foliage if not carefully looked after. A mall pot with a bit of dry hay or moss in it makes a good trap for earwign, and it hould be examined every day. Bedding Dablias should be pegged down as soon as they require it.

PROPAGATION. \& - The layering of Carnations and Picotees should now be proceeded with, especially of varieties that are scarce, and where the blooms are not required for cutting purposes. If large \&)wers are required, take out the lateral buds, and leave only the end bud on each spike, and when the pods start to burat, some protection should be afforded against rain in the way of hand-lights or canvas on tripod. Cattings of Carnations and Pinks may now be taken and patin, six in a 48 -pot, planging them in a pit where there is some amount of bottom heat; orthe cuttings may be pricked out ander hand-lights or in framer, and kept close and shaded till rooted. Cattings atrike beat in candy loam and leaf-soil of about equal proportions. Cattings or slips of Aariculas, Sweet Williame, Pentstemons, Antirrhiniama, Paloxes, herbaceons Pansien, Violas, and Walldowers, may also be atruck in this manner.

ZONAL PELARGONIUMS.-Scarce varieties which may have been kept for propagating uses shnuld now be increased as fast as cuttings can be obtained. Place the cutting-bed on \& anny border. When wellrooted and not before, place them thickly in boxes for storing ander glase whea the time comen for oo doing. Cuttings may be taken as late as Saptember.

SEED GATMERING AND BOWING.-Seed-pod. of Auriculas, Primroses, Polyanthuses, and Pinks should be gathered as soon as ripe, sowing the seed without delay in beds or in drills 1 foot apart. Old plants of the above may now be divided, the roots being shortened somewhet, planting them afresh in mome rich garden mould. They flowering well the next year. Early-raised seedling should be planted out, taking care that they do not lack water in dry weather. Old plante of Pung, Viola, Arabir, Alysuum, Ajuga, Aabrietia, \&c., may now be divided and replanted in moil enricheá with decayed short manure, shading and watering them for a time. Affurd attention to the planting out of seedling Auemones, Aubrietias, and Wallfowern, that will bs required for planting in the autuma in the spring garden. Sow hardy annual for epring flowering, viz, Silene pendula, Escholtzia, Myosotir, \&c., pricking the ueedlinge out as soon as they are large enough to be handled.

## FRUITS UNDER GLAEB.

By Richard Parieer, Gardener, Goodiwood, Chichester.
BTRAWBERRIES in POTS-ODe of the chief matters connected with successfal calture in pots is the securing of early ranners, so that the plants may become completely established in the fruitingpots before the sutumn. It is a naving of labour to layer the runner on the fruiting pot, and
needr much care in affording water, as the soil is apt to become sour before the aeason is over, and then the plant is are to nuffer in health. I have commenced layering different varieties in amsil 60 , and everal thousand are required to cover our wants. The more promising plants will be selected as aoon an they are rooted, potting them at once into 32 ; thou which remain being planted in a well-manared border, and by keeping the flowern picked off thest plante, they will supply atrong early runners another year. Where plant for furnishing runner for forcing have not been so treated, and the gardener has to resort to the fruiting beds, it is desirable to assist the old stools with several application of manare-water, freeing the bed from weeds, and the plants of weakly and cramped growth. The mont promiving rannere should be elected for layering, the pot being stood in each alternate apace. Water bould be affurded with a rose watering-can morning and evening antil the runners are wellrooted, when they may be placed as anon a possible in the fruiting pots. It is not a wise course to starve the young plant in a mall 60 pot. The filling of the mall pote should contain a small quantity of decayed manure as an aid to root action, and to prevent the moil becoming hard. If the layering has to be done on the fruitiag-pots, these should be quite clean, and drainage good, a amall quantity of soot being placed on the tops of crocke to prevent the ingress of worms. A compost of a retentive nature is best for the Strawberry, and very firm potting should be the rule. If the loam used is of a very heavy nature, one-eighth of it balk in spent Mashroom-bed dung may be added, together with a sprinkling of woodashes, bone-meal and soot. Keen's $S$ edling is atill one of the best as a firat early fruiter, and may be followed by Vicomtesse Hé-icart de Thury, which, though mall, is one of the richent-flavoured Strawberries grown. La Groste forces well, and producee fine fruit, but the farour is not first class. Royal Sovereign, a new variety, is an excellent forcer, and will become a favourite in time. President is not grown to such an extent in pots as formerly-it is, however, a useful variety, to follow the earlier ones. Where there is accommodation, a few handreds of British Queen should be grown in pots, as these brought on alowly prodace as fine fruit of the richest flavour about the ame date an, and are preferred to, the first earlies growing on warm bordere out of doors. Jamen Veitch and Augute Nicaise are varietien which produce fruit of large sizs when grown in pots, if not forced too early, and they receive plenty of ventilation.

## PLANTS UNDIER GLAB8.

By W. H. Smith, Gardener, West Dean Park, Chichester.
TABLE PLANT8.-Small plante of various apecies for the decoration of the dinner-table, where thin kind of thing is largely carried out, must not be neglected at this season, for it is now more easy to find suitable houses for them than at some other seasons. Tae present is also a suitable season for propagating and preparing some of them for next winter. Palme deservedly rank high as table plants, and some of the bent are Geonoma gracilip, Cocos Weddelliana, and Areca Verschaffelti. Thete thould be kept in pairs in pote of various sizes, especially 60 s. Taey do well in sandy loam in well-drained deepith pots. Crotons of telling candle-light coloar may have the tips of well-coloured shoots cat off and struck singly in amall pota. Suckers of Pandanua Veitchii may be detached and potted in andy loam and peat. Ferns, in variety from sores, when potted ap, are always useful decorative stuff. Dracæna Cooperi, D. Guilfoylei, D. angugtifolia, D. terminalis, and D. hybrida; Aralia Veitchi, A. V. gracillima, A. elegantiasima, Casaarina ericoides, a particularly lightand gracefal plant, will alss be found of service. Of dowering plants that may be grown on to the flowering stage in 60' are Begoniss Gloire de Sceaux, Gloire de Lorraine, John H *al, Winter Gem, and Adonis, Gesueras in variety should not be forgotten.

LILIUM8. - These plante will require to be topdressed with rich loam, or loam, leaf soil, and dry cow-dung, placing this well up and about the atem. They will also require to be plentifally anpplied with root-mointure, and occasionally with manare-water, asy, twice a week. Place a atout stick to each atem, and on the first appearance of "由y" fumigate the plants. If a few of these are placed out-of-doors, the flowering season will be much lengthened.

CHRYSANTHEMUMB. - In case the final potting has not been done, no time should now be lost in getting the plante potted. Thowe which were cat
down early in Jane will have now grown aufficiently for the gardener to diatinguish which of the ahoote may be left, and which rabbed off; about nix boota should be reserved; pot these lat plants in 9 inch pots, and atand them on a bed of coal-ashen in full nanshine. Plants intended for the production of large flowers should be secured to stout stakes, or horizontally atretched lengths of wire placed a good distance apart. If posts or iron rode are driven into the ground about 15 feet apart, with a wire atrand along the top, the Chryanthemum atake can be tied to this, and injury by the wind effectually prevented.

BOUVENIR DE LA MALMAIBON CARNATION. The joung plants of thi variety, if they were layered as advised on p. 653 of the last volume, will now be ready for potting into 60 pots. Much care will be required in separating the layers from the mother plants, or many of the rootn will be broken off. Pot them rather firmly in a compost of loam, peat, leaf noil, and and, place them in a cold frame, and keep rather close and lightly shaded till they have pushed root into the new soil. Continue to layer shoots as the planta finioh flowering, bat reserve an many an may be required for potting on into large pote for early work.

## TEE HARDY FRUIT GARDEN.

By W.POpe, Gardener, Highclere Castle, Newbury.
PEACHES AND NECTARINEB.-Tae thianing of Peaches and Nectarines abould now be completed. Continue to stop sub-lateral shoot at one leaf, and secure the young wood by tying or nailing it an growth advancer, so ato afford the fruit the full benefit of air and sunshine. Syringe the tress frequently, to prevent red-apider finding a lodgment; an insect apt to be very troublenome under fixed glans copinge, enpecially if the trees do not get a suffi sieacy of water at the roots. Occasional soaking of sewage other liquid-manure will be of great benefit now that the fruit is swelling, but it must not be applied too strong, nor yet in driblet.

BTRAWBERRY PLANTATIONB.-As SOOD as the fruit in gathered from Sirawberry plantations, cmi off all runners not wanted for increase, together with old leaves, \&c., and clear away all straw and other molching material st the ame time. The sarface-soil should be loosened by hoeing, and if a mulching of rotten manure can be applied afterwards it will be of great benefit to the plants, in atrengthening and plamping up the crown for another season. If the beds are to be destroyed, do this without delay, so that the ground may be utilised for winter crope of Broccoli, for which it is generally auitable without any pecial preparation. Three years, or at most four, is a sufficiently long time to allow Sirawberrie to remain on the ame ground. After the third year, an a rule, the fruits deteriorate very much in aize, and consequently in weight. If runner are to be layered in pote for new plantations, they ahould be layered at once, or if not convenient to do this on the ground, very good results may be obtained by taking ranners that may have slightly roosed into the ground, potting into large thumb or amall 60 sizad pots, and putting them at once into a frame; when by keeping them clow after watering, and slightly shading for a few days, they will soon begin rooting freely, and may ba gradaelly hardened off and planted as required; mach planta anwer perfectly for mid-seaton and late forcing if taken in good time. When rooted runners are received by post or otherwise from a dintance, they should be treated in the same manner, for if ever so well-rooted they rarely make a satiofactory start when planted out without preparation. If any plante are to remain in the nureery bede throughout the winter to be planted out in the epring, they may be allowed to root into the aoil between the rows. Take them up with a trowel when rooted, and plant in rows a foot apart, and 6 inches from plant to plant. Water well, and thade alightly for a day or two after planting.

Hedysarum multijuaum.-Namerous corrempondente have written to confirm our doubt at to the identity of the plant sent from the Cambridge Botanic Garden ander the above namp, and figared in our last isaue. Mewars. Barbiers \& Sons obligingly send specimens corresponding with the figure in the Gartenflora. We will endeavour in a aubsequent issue to atcertain the trus atate of the cave.

## EDITORIAL NOTICES.

## Advertisements should be sent to the PUBLISHER.

Newspapers-Correspondents sending newspapers should be averul to mark the paragraphs they wish the Editor to see.
Local News.-Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be to the Editor early intelingence of local events withich it it desirable to bring under the notice of horticulturists.
Letters for Publication. - All communications intended tor publication, as well as specimens and plants for naming, thorld be addressed to the Editor, 41, Wellington should be addressed to the Editor, 11 , Welwngtion
Street, Covent Garden, London. Communications Street, Covent Garden, London. Communications
should be WRITTEN ON ONE BIDE ONLT OF THE PAPER, should be WRITTEN ON ONE SIDE ONLY OF THE PAPER, sent as early in the weet as possible, and not be printed, but kept as a guarantee of good faith. The Editor does not undertake to pay for any contributions, or to return unused com munications or illustrations, unless by special arrangement.

APPOINTMENTS FOR THE ENSUING WEEK.
MEETING.
gaturday, July 13-Royal Botanic Society.
SHOWS
aturday, July 13 \{ Wood Green Horticultural, Galashields Horticultural.
WEDNESDAY, JULy $17\left\{\begin{array}{l}\text { National Rose Society, at Derby; } \\ \text { Waterford Horticultaral }\end{array}\right.$ THUBSDAY, July $18\left\{\begin{array}{c}\text { Halifax Rose, Canterbary (Kent) } \\ \text { Hoopital Fête. }\end{array}\right.$

## SALES

tuesday July 16 Imported Orchids, fiom Measrs, Hugh Low \& Co., at Protheroe \& Morrie Rooms.
FRIDAY, JULY $19\left\{\begin{array}{l}\text { Imported and Eatablished Orehids, } \\ \text { at }\end{array}\right.$

CORRECTRD $\triangle V E R A G E$ TEMPRRATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATKONS OF FORTY-THRER YEARS. AT CHISWICK.-63.4.

National Rose
Societris Rysis
society's KIh Glousester.

The first of the three exhibitions of the National Rose Society was an unqualified success. For many years the National held two exhibitions, one metropolitan and the other pro-incisl. A few years ago, however, an attempt was nade to hold an earlier show of Teas and Noisettes in conneotion with the Royal Hortioultural Society at the Drill Hall, as it was urged that the best blooms of these classes were past before the Crystal Palace show came on The attempt was not a very successful one, and it was ultimately determined to supersede it, and to have three general exhibitions-Metropolitan, Northern, and Southern. Previons to this, Glonoester had asked for the provincial show to be held there, and the request had been aooeded to. But then came the tempting request from Windsor to hold the first southern show there; and the fact that the show was to be patronised by Royalty, induced the committee to ask Gloncester to waive its claims for another year. It was, perhaps, an advantage to them that they did so; it gave all conoerned more time for maturing their plans. The place was convenient, the tent an admirable one, while the courtesy and kindness of the secretary, and the hospitality of the Mayor and officers of the local Society, made everything move with the atmost harmony.
There are two classes of persons who visit exbibitions of this kind, those who are captivated by the brillianoy of the show who are perhaps ignorant of its real character, and therefore view it with an uncritical eye; to them the Roses are perfection, and they cannot understand how any fault oan be found with them. There are those, on the other hand, who are hardened, so to spealf, by the exhibiting of twenty years or more, and whose judgment is not influenced by what first meets the eye, but by a comparison with the results of former
years; they:may be at timesteracting, as when someone says.that is the finest bloom of Horace Vernet that ever was seen, they quietly add "but don't you think the color $\mathbf{r}$ is a leetle gone?" Beautiful and bright as the Roses were on this occasion, they were perhaps somewhat wanting in size and solidity. There were no exceptionally grand blooms, and when one considers the terrible winter through whioh Rose growers have passed, and the long drought of the last two months which has so disappointed the hopes of gardeners and farmers, it is marvelloas that on such a day blooms of sach freshness could have been shown, more especially when they have had, as in many instances, to make a night journey on such a close and sultry night as that which preceded the show.
There has seldom been a more close contest than that which took place for the 5 -guinea oup presented by the High Sheriff of Gloncester ; and when ultimately the prize fell to Rev. J. H. Pembrrton, no doubt could exist but that it was a hard fought and well won victory. The details of the fight were given in our last issue.
In auch a season it was not at all likely that blooms of surpassing excellenoe should be seen, none oonoerning whioh yon would say to a brother rosarian, "Have you seen Smith's splendid bloom of Marie Baumann, or Jones grand Catherine Mermet?" and hence it happens that peculiar interest attached to the seleotion that would be made for the best bloom in the respective classes. Now, it very often happens that in the great race of the Derby the favourites on whom long odds have been laid are nowhere, while an outsider carries off the ooveted prize Last year at the Crystal Palace, for instance, Marguerite Bodet carried off the silver medal in the amateur's olass for Dr. Budd, and this year an equally little-known rose did the same for Messrs. Harkness in the nurseryman's class, for few poople have heard of the Rose in question, Comtesse Ludre; this is a bright carmine red Rose, which was sent out by Eugenne Vradibr fifteen years ago, but has never, so far as we know, been exhibited before, and yet although there were fine Roses of well-known varieties, the coveted prize was awarded to it.

The curiosity which is always active as to new Roses was not destined to be gratified at Gloucester; there were no seedlings exhibited for oompetition for the gold medal for the best seedling, and amongst new Roses already in commerce there was hardly anything that merited special notice.
A beautiful yellow Rose was exbibited by Messrs. Jeffribiss \& Sons, of Cirencester. it is a seedling between Cloth of Gold and Maréchal Niel, a beautifal soft yellow with good glossy foliage, and stout foot-stalk, more resembling Cloth of Gold than Marechal Niel. The severe winter of last year tried it very muoh, but it is to be hoped that the raiser may be able to bring it forward at some later show; it is of rampant habit, and should it fulfil its present promise will be a valuable addition to what are called our climbing Roses.

Whatever interest may be taken in other exhibitions of Rose Societies throughoat the country, there oan be little question that they are all eolipsed by that taken in the great Metropolitan show held by the National Society at the Crystal Palace. Whatever doubts may have existed as to the saggestions by which amateur exhibits were regulated by the number of plants grown, it is unquestionable that though it may not have realized what some expected, it has given a stimulus to Rose exhibitions.

Everyone must have been struck by the immense improvements which have taken place in the arrangement of the show under the direction of the Garden Superintendent, Mr. W. G. Hrad Instead of the long formal line of bozes stretch ing from end to end of the transept, the exhibition was broken up into groups containing a few olasses, and this, as the bores were mingled with growing plants, no: only gave a pleasanter aspect to the exhibition, but also enabled visitors to move about $m$ rre freely, so that it was possible at any time during the afternoon to gtt a sight of the flowers.
Conjeotures, anticipations, and opinions have been freely indalged in, and as asual some of these were right and some wrong; thas, it wu generally thought that it would not be a firto rate exhibition, and this, we think, notwithstanding the fine blooms exhibited by some growers, was the true state of the case. The flowers in most instances lacked substanoe, and, consequently, staying powers, those that wene groxn on heavy soils atanding best. It was alo expected that, owing to the character of tha season, the northern growers would stand the best chance. It will be seen that this was ab the oase, the ohief prizes both in the nursermen and amateur classes going to soathen growers. In comparing it with the exhibi tion held at Gloucester, the verdiot we think would be that the Teas and Noisettes wer better at the provincial exhibition, and the hybrid perpetuals at the metropolitan. A happens most times at a great show, the amateurs are fully abreast of the norsery. men in the excellence of their exhibits, and in faot the stand of Mr. Lindskil's, in the Trophy Class, would, if there had been such prize, have been awarded that for the best bor in the show; it contained some grand blooms the colour and freshness of which at ssonh season as the present were remarkable. It coontained, moreover. a flower to which the Silver Medal of the National Rose Society for the bat hybrid perpetual in the amstenr classes ns warded; and it is somewhat remarkblil that the award for the same prize in nurseryman's olass was given to the sus flower in Mr. B. R. Cant's stand. No outside this time oame in to carry off the honours, wil it is tolerably olear from the number of bloom erhibited and their excellence wherever shom it must be regarded as "Her M"jesty's" getr One could have anticipated that it would hare been just the year for Comtesse do Nadillec bat it was not so; very few good blooms of it wore staged as far as we could see, and the Tea Rose which seems to have come out mo conspicaously was Madsme Cusin; for whenere shown, it had a richness of oolour quitt ets ceptional, and indeed, in one instance, mbero one of our most experienoed growers had at a grand bloom of it for his box, he would ab sllow it to be staged, becanse he oonsidere it out of character.

It was anticipated that garden Roses would b somewhat deficient, and this proved to be oase. A most beaatiful colleotion which won tix first prize, oame from Bath, and another from Dandee. In the same way, new Roses were m plentiful, and of these none of those from blowit seemed to attract any attention; neither wis ther anything very striking in the absolutely $D$ Del Roses, namely, those which are not in merce, and were exbibited for the Nation Rose Societys Gold Medol. None of was adjudged worthy of the Gold Medsl. two exhibited by Messra. Dresson (one ras similar to The Bride and another a pink were highly commended; Mears. Coorm

Bladna is a large Rose, very fall, somewhat in the style of Merveille de Lyon, but higher in the centre, but the texture of the petals was somewhat thin; this may have been owing in some measare to the season. Mr. Winl Tay-
and East Anglia has claimed the palm in the contest; rarely has greater pleasure been displayed among all classes of Rose growers and Kose exhibitors than when it was announced that the old warrior, Mr. Ben Cant bad again

Mr. F. B. Lindseli carried off the Challenge Trophy with a boy of blooms, which, as has already been said, might be justly termed the best in the exhibition. Mr. O. G. Onrus, from Colchester, carried off the Tea Tropby

Fig. 8.- catagetum tabularb, variety mhinophorom: colouns aremxhe brown. (ant p. 44.)

Lor's was a high-coloured Rose, very sweet and promising, but anfortunately he had not complied with the schedule, thus the two exhibitions of the National Rose Society have passed withont any additions to our Gold Medal Roses.
With regard to the ohief honours of the day, they have followed, as far as nurserymen are concerned, the oourse of the last couple of years,
carried off the Trophy, together with the Gold Medal that acoompanied it; while, as we have already said, the best blooms of H.P. was found in his box, for which be gained the Silver Medal. Mr. Franic Cants flowers were also exceedingly good, while Mesars. Prior \& Son showed that they were determined to huld the place they had of late years aspired to. In the amateur classes,
as well as other pieces of plate. There were upwards of 100 extibitors from all parts of the kingdom, and this it must be remembered is a very different thing from an exhibition of Cbrysunthemums or Dahlias-you may stage both of these the day before in the stands in which they are to be exhibited, and the probability is, that unless some extraordinary mishap overtakes them, they
will be exhibited as they left their owners' garden; but not so the Rose, the long railway journey, or hot nights, may shatter half his blooms, and consequently he mast bring with himia box of what he calls "spares," of ten containing twice the number that he actually requires, and with which he can replenish his bozes on the morning of the show. It is this enthasiasm which tends to keep the National Rose Society alive, and every year to extend its operations.

Catabetum tabulare, Lindl, var. rhinoPHORUM, Rchb.f.-The apecies is one of the most interesting of the carions genus Catssetum, and the interest in it curiously-constructed flowers is still farther heightened by their extreme variability both in form and colour. The type was described by Lindigy in 1840 , and since that several distinct varietie have been recorded by the late Professor Recchenback in the columns of the Gardeners' Chronicle, three of the most distinct being one with greenish flowers, slightly blotched with light parple-brown; C.t. brachyglossum, which bas a shorter lip and mach broader callus than the type; and C. t. rhinophoram (described in the Gardeners' Chronicle, p. 358, Sept. 18, 1880), of which the author eays, "the whole surface of the callas is broken in innumerable, irregular, transverse-toothed lamelle, of white coloar, with spote of 'burnt sienas,' thus making one think of a file-hence the name." The striking feature in Catasetum tabulare is the broad, fleshy table-like callus which occapies the greater part of the lip, the toothed or bristled margin of which is curned up around the raised table, thus forming a gallery which traverse how he may lead the ingect promenader to the setæ, which apring and release the pollinia. The colour of the large raised csllus is asaally white, and its surface is generally mooth, but in the instance illustrated it is rough and like the other parte of the flowern spotted with red-brown of various shaden. The Catasetums are fast increasing in favour in Orchid collectiong, and as a consequence their habite and requirements are more closely observed than formerly, and their caltare in now considered nimple, if they be treated like other Otchids which lose their leaves and require a drier and cooler situation during the resting season. The plant from which our illustration (Gg. 8) was taken was exhibited by Memers. J. Veitch \& Sons, Rayal Ezotic Narsery, Cheisea, on June 25 last, at a meeting of the Rojal Horticaltural Society.

Blanchina, - The annoancement that Mr. Francis Darwin was to lecture at the Royal Horticultural Society aroused much interest. Mr. DABWis was associated with his father in carrying out many of those experiments which have proved so ntimulating and suggentive. Oa this occavion he chose for hil abject the changea in form and atructure connected with blanching or etiolation, and he showed that these changas are not to be conmidered of a pathological nature, but are the resuit of edaptation to adverse cireumatances. The lecture was very clear and concluvive, bat more fitted for the Scientific Cummittee than for the miscellaneons groups that constitute the " 3 o'clock meeting." The pablication of the lecture in the Journal will be
awaited with intereat.

The Royal Gardenerg' Ofphan fund.The unal Rose Fair in aid of the Royal Gardeners Orptan Fund, was held in conuection with the Croydon Horticultural Society's show on Wednesday,
Jaly 3 and the amonnt taken for the alle of flowers Jaly 3 , and the amount taken for the sale of flowera
was $£ 71680 \mathrm{~d}$. Aroong the contributore of bloome were Mesars. F. SANDEse \& Co, Huger Low \& Co., Lateg \& Sons, B. Cant. T. B. Haymood, H. V. Macain, M. Hodason, E M. Betrone, W. Mase, C. J. Saltri, J. Slater, C. Lake and Riv. J. H. Psubburon. Mrs. W. Guwnes again kiadly under-
took the ale of the flowern.
Gardeners' Royal Benevolent ingtitu-
tion -The Wor hipfal Company of Skinnera have
given a donation of $£ 1010$ s, to the funds of the Gardeners' Royal Banevoleat Institution.
"Dictionnaire Pratique d'Horticulture et de Jardinage.-The French translation by M. Mottet, of what has coms to be known as Nicholson's Dictionary, has now reached its 39 .h part, which brings the work up to the letters Met. The tranalator has added to the original text, and enhanced its value. Additional illastrations are alno applied.

Stock-taking: June.-Every day's experience in the matter of actor-taking tends to convince us that Pope, in his "Esasy on Man," hit the mark when he wrote "Man never is, but alwaye to be bleat," for have we not been looking forward, not to a rush, but to a gradual rise in the values of both imports and exports-and have we not been doomed to a partial disappointment? All was going on nicely, when on came the Whitaun holiday! and a parliamentary dislocation, and over go our calculation. Bat the fall this month is not a very large one, $£ 345,095$, or about 1 per cent. as compared with the Retarns for Jane, 1894. Here is our unual extract from the Summary of Imports:

| Tmports. | 1894. | 1895. | Difference. |
| :---: | :---: | :---: | :---: |
| Total value of imports | $\underset{34,229,579}{\ell}$ | $\underset{\substack{\mathcal{L}, 884,584}}{ }$ | $\frac{\boldsymbol{x}}{-345,095}$ |
| $\begin{aligned} & \text { (A.) Articles of food } \\ & \text { and drink }- \text { duty } \\ & \text { fron } \end{aligned}$ | 13,414,987 | 12,585,318 | -829,669 |
| (B.) Articles of food and drink-dutiable | 1,439,023 | 1,551,788 | +112.785 |
|  | 4,390,045 | 5,219,880 | +829,835 |
| Raw materials $\begin{gathered}\text { fundry } \\ \text { and mastries } \\ \text { and manafactures } \\ \text { ind }\end{gathered}$ | 4,383,931 | 3,676,176 | -688,755 |
| (A.) Miscellaneous | 1,110,635 | 1,213,218 | +103,583 |
| (B.) Parcel Post ... | 98.808 | 70,371 | -26,435 |

Wheat has increased by 334240 cwt. over Jane last jear, bat this has had no effect on the price of the loaf other than to raise it : the price of Wheat on the market has gone ap some 6s. in about as many weeks, and it would be intereating to note what the changes (and charges) have been during the past hundred jears, bat space will not permit. Tea shows a rise of £79,000, and $£ 95,000$ in coffee; spirite have gone down by $£ 60,000$. Other food supplies fell off some $£ 830,000$. Oats gained £144000 from Russia; cheese shown a reductionthough the arrivals from Australia bave nearly doubled. Batter from Autrasasia has gone down in quantity - also from France and Denmark. Timber shows a reduction of $£ 780000$-last year' imports for the same period baing exceptionally beavy. Textile materials were $£ \star 30000$ over June, 1894; cotton went up £293.490; while flax increased by $£ 266,405$; wool went up $£ 170,000$. Manufactured articles, mainly ailk stuffs from France, show an increase of £233,153-but leather and woollen manufactures font up for aboui a third. Fruits, \&ce, now claim attention, and here is our uaual excerpt :-

| ImPORTS. | 1894. | 1895. | Difference. |
| :---: | :---: | :---: | :---: |
| Fruits, raw:- |  |  |  |
| Apples .** ...bush. | 38,198 | 50,558 | +12,360 |
| Cherries ... ... | 193,231 | 115,670 | -77,861 |
| Plums .e. .** | 3,731 | 4,660 | + +929 |
| Pears | 157 | 13 | +929 |
| Grapes | 4,006 | . 13 | -144 |
| Unenumeratod | 245,897 | 155451 | -1 |
| Onion* | 328,548 | 318.021 |  |
| Potatos ... ... owt. | 1,251,283 | -8,021 | $-10,527$ |
| Veretables, raw, unenn. | 1,20,203 | 951.735 | $-301,528$ |
| merated ... ... value | $170.5 .50$ | $\stackrel{e}{199,746}$ | $\begin{gathered} e \\ +29,106 \end{gathered}$ |

Soms of these figure are well worth noting. To pase, it may now be agreed that the new Manchaster market is a success ; in one day 300 tone of foreign fruit were put up to auction, aold, and despatched to their final
was done with some 14,000 package of frait, and we are informed that a new line of ateamers-the Gaelph - will be placed on the Australaian line, for the carriage of agricaltaral produce to Manchester.

## The Exports

foot up at $£ 17,800,100$-a decrease of $£ 109,055$, Uader the hesd of " manufactured articles," there is a gain of $£ 485,000$, of which $£ 333,000$ is due to arms and ammunition. Metals went down £245,721, telegraph-wire figaring for nearly all this amount. Cotton goods fell off considersbly, but linens went up -America also baying largely in the woollen and worsted department. Cosls fell off to the amount of £123.729. Manare fell away to the value of nearly £75,106. The exports for the six months anow a loss of $£ 106,117,516$-the decrease being $£ 765,959$. We can only hope for improvement in our next report.
"The Botanical Magazine" for th9 present month contains description and coloured figures of the following plants :-
Senecio Hualtata, Bertero, t. 742. - A noble Senecio from temperate Chili and Argentaria. It is a tall herbaceoas plant, with bold cordate-oblong leaves, somewhat woolly and a branching inflorescence, bearing numerous cream-coloured flower-heads, each about 1 inch in diameter. It is hardy at Kow, and flowered in that establishment in Jane last. It is allied to S. sagittifolius, already figured; the apecific name is an adaptation of the appellation generally given to the plant by the Chilians.
Pyrus C'rateyifolia Targioni, Tozzatti, t. 7423.An Italian apecies, having more the appearance of a Cratman than of a Pyrus. The leaves are like those of P. torminalis, but the inflorescence is lax, and the pedicels long and alender. Kew.

Aristolochia ungulifolia, Mastera, t. 742t.-A curious Burnean species, figured in these pages, 1880, vol. ii., p. 116 . fig. 28.
Newwiedia Griffithii, Reichenbach, t. 7425.- A highly interesting plant, linking Occhids to Irids. The leaven are plicate, and the numeroun white flowers borne in long erect dense spikes.
Rubus lasiostylus, Focke, t. 7426. A Chinese apecies with pinnate leares, nowy-white beneath, the nerves beligg of a pink colour. The flowers are in loose cymes, each about 1 inch in diameter parplish. Hardy at Kow.

Messrs. W. P. Laind \& Sinclair.-The annal outing of the emplojér of thi well-known firm of nurserymen at Dundee, was heid at Glamis Castle, on Wednetday, 3rd inst., 2 very enjoyable day being apent.

Ealing Horticultural Society. - The annual show of this Society took place on the 3rd inat., in the beautifal grounds of Gannerbbury Park. The number of exhibite was not no large as avunlin fact, the showe of this Society do not compare favourably for some reason with its earlier exhibitions. In the principal class for a group of plants arranged for effect, the saccessfal exhibitors wers Mr. W. Roberte, gardener to J. Harris, Eiqq, Braemar ; and Mr. Long, gardener to E. P. Oakshott, Esq., Orchard Dene. For twenty-four diatinct varieties of cut Roses, the 1et prizs (only entry) was awarded to Mr. C. Tarner, Slough. A good competition renulted in the prizas offered for eighteen Roses (not fewer than twelve varieties); lat, Gold Medal of the National Roee Society, Mr. El wards, gr. to W. O wen, Eqq; 2ad, Silver-gilt Medal, $\mathbb{N a t i o n a l}^{\text {Rose }}$ Society, Mr. C. Long; $3 \cdot \mathrm{~d}$, Silver Medal, National Roae S.riety, Mrs. B Boseg; 4;h Bronze Medal of National Rose Society, Mr. S. Lowe。 An excellent dieplay of garden produce wae made bs the cottagers of the district.

Paactical Gardenina in Egypt. - Mr. Waitre Drapirr has been giving a course of lecture: at Ramleh on this mubject. The lectares treated of the following matters : Botanical clasification of plants, climate and soil, trees and Palme, arrangement of a garden, the planting of shrabberies and borders, lawas and flower-beds, climbiag plante, plants for windy and sheltered positions, Rosea,
annuala, hedges, conservatorien, specimen isolated plante, water-gardening and aquatice, potting, balbs, Chrysanthemums, Cactus and succulents, garden economic plants, Vines, fruit-trees, praning, grafting, and propagating. Mr. Deaper, who is an old Kewite, has been appointed director of the government gardens at the Barrage, near Cairo. A book on Gardening in Egypt may shortly be expected from Mr. Draper's pen.

Orchid Hybrids.-We learn that Mr. Hansen's complete list of Orchid hybrids is in the press, and will shortly be issued.

The Cotton Plant ie losing ites popularity as a "safe inventment" in the very heart of the cottongrowing States of America. Time was-some forty years since-such an assertion would have been laughed at. "You cannot do without American cotton" was the article of faith set up by growers and brokers on the other side of the Atlantic; starvation in Lancashire during the cotton famine shook the belief in many minds, and alterations in apinning and weaving machinery broaght ander anbjection cotton of short staple; planters and capitalists took up the caltivation of the plant; and to-day, Lancasbire is no longer dominated by New Orleans or New York. But planters in the Southern States kept on; and in the face of a steady fall in pricen, opened up all over the world a market for cotton seed, cotton oil, and cotton cake. Of course, the same products can be placed on the market wherever cotton is grown, and capital can be utilised. Should it be desired to learn where cotton is grown at the present time, the intelligence can be had from the " market" columns recording sales in any daily paper any morning in the week. And it has come to pass, that it has been determined to reduce considerably the growth of cotton in America. The renalt of the special investigation set on foot by the Federal Goverament's Agricaltural Department in 720 Cotton-growing counties in the United States shows that in eighty-eight there will be little or no change in acreage as compared with 1894 ; five report an increase up to 10 per cent.; two, an increase of from 11 to 20 per cent; three an increase of from 21 to 30 per cent. ; and three an incresse of over 30 per cent. ; 127 show a decrease of 10 per cent. and less ; 250 a decrease of from 11 to 20 per cent.; 158 a decrease of from 21 to 30 per cent. forty-four a decrease of from 31 to 40 per cent.; seven a decrease of from 41 to 50 ; and thirtythree a decreane of more than balf. This decrease in acreage is not confined to any particular locality, but covers a widenpread territory, embracing almost the entire area devoted to Cotton cultare. The extraordinary low price of the ataple gave rise to the agitation as to the necensity for reducing the acreage in $1 \varepsilon 95$; this resalted in a convention this year, and a rise in prices is hoped for. Doabtleat, mach may be done in improving the varieties now grown, and so placing on the market the higheat class of raw material. Meanwhile, the above noted fact are aurely well worth record.

Pelargonium Sport.-Mr. Walker, of Wellfield, Leyland, sends us a truse of a very pretty fleah-coloured or rosy-pink variety of Pelargonium, which originated as a aport from "Mr. Povis." The flowers are very double, no that the aport neems well deserving of propagation.

The international Fruit, Wine and Vegetable Exhibition at Berlin.-This exhibition, as we learn from nin official announcement, which is to form a part of the more permanent one of the National Hygienic Society, will remain open to the public from Jaly 1 to some date in September, It will be held in the old Reichatar buildinge, which have been lent by the Prumian State Government for the purpose. The exhibition has created very general interest both in Germany and other countries. It will not be of the asual kind, as may be gathered from the programme, which farthera neither the interents of the producer nor of the consumer. On the contrary, it is intended to entablish a well-
organised agency, whereby producer, and seller, asd the wholesale bayer will be brought together to their mataal beneit, and that of the German people. Au addition is made to Rale 13, which will make it possible for a visitor to the exhibition to take out the value of his entrance money in exhibited articlep, by which it is hoped that the namber of visitors may be increased at the same time that the extibitor will be enabled to sell his good more freely. Articles which are periabable, and which have not been aold by the exbibitor, will be wold regularly at public auction, for the bentit of the latter. The exhibition will serve, not only as a means of disposing of goods according to sample, bat also an a market where the finer sorts of vegetable, Grapes, and conserved goodp, wine, \&cc., can be ordered from the producera, and the carriage of the ame by railway or post arranged for. Prospectuses and forms of application will be sent, post-free, from the office of the Iaternational Hggienic Exhibition, Berlin, W. Leipzigerstrasse, 4, apon application.

Oxford University: Mathematical Honours.-Many of our readers will be pleased to hear that Mr. J. Hodson's son has just paased the final pablic examination (Greats), taking first-class honoars, thus repeating his anccess of 1893, when he took first-class honours in the first pablic examination (Mods.). He proceeded to his B.A. degree on Saturday last. He holds a scholarship at Jesus College, the said acholarship being renewed for another year, in order that he may take acience as an additional subject.

John Wills.-As we go to press, we hear with great regret of the death of this prominent horticulturist on the 9th inst. Mr. Wills was in his 64 th year, and had been affering from illnens for a long period. In our next insue we ahall allude more at length to his work in horticalture.

Caution.-The following letter telle its own tale:-Dear Mr. Cannell, There is a ratcal going about representing that he travel for you, and is selling to the unsuspecting people awfal rubbish. He called here, of courae after I had gone to town, and perauaded my wife to buy some wonderfal Carnations, \&c. The enclosed is the reanlt, and they are all the name. It in ratter clever to get s lot of label printed, and then state that be represents a man so well known as yourself. H. P. B., Solicitor." One of the labele reada "Malmation, ailvery edge Clove," the other "Turner's Maaterpiece." The specimen encloned was valuelens.

## PLANT PORTRAITS.

AMORPIA Carescens, Mchans' Monthly, June
Cannas.-1, Saraf Hill, zed self; 2, Maurick Mussey, orange-pınk self, Garden, June 22 .
Dendrobium vobile sobilius, Illustration Horticole, June 30.
dipladenia atro-purpurea, Illustration Horticole, t. 33.

Thuybergia grandiflora, Illustration Horticoic, t. 32.

## Home Correspondence.

THE 8LEEPY DISEASE OF TOMATOB.-Dae prominence has been given in your leading columns to the prevalence of the so-called "sleepy disease" in Tomatos, and to the canse thereof. I am a grower of this frait for market of near apon a quarter of a centary's experience, and my daily occapation from early morn till darkness sets in is amongst the plante I therefore claim to have ame little practical knowledge of that particular crop. Moreover, I have been sorely troabled and annoged with the "sleepy disease" in question, hence the article anent the same intarented me greatly. For the past eighteen monthn I have visited many gardenc, collected information
by means of the local prest, and experimented with a viem of finding oat the cause of thit myateriona diseare, and at lant I ventare to think I have solved the problem-at least in my particular case-though I may say not in tha direction of that ett forth by your correspondent in the article on the su' ject in question. I have no heritation in easing that this diesese is not in all casea due to the fungus Fasarium lycopersici', or any other of that natare. I certainly do believe that if sach did really exist in the soll the plants would go sleepy, but in my case after several minute examinations lat year of every pait of the roots, at also the soll, I came to the conclusion that fungus was not at the botsom of it. Moreover, there is no dirculoration of the leaves or stem, no "delicate white bloom;" after a time, in fact, with the exception of the droopiog of the leaver, the characteristics are distimilar to that described in the said article. With a view of howing that fungi were not present in the inatance which have come under my notice, I will just atate that, say two plants planted in a box or put, one will go off, and the other remain healthy and froitful to the last. As recently as last week a large plant in a box with frait of half size showed signs of drooping it was at once pulled up. The soil was worked ap, no fresh aoil being added, and two young healthy plants pat in. $\Lambda$ few days after, the surface was covered with white rootlets. This is but one inatance as I have had many auch, though I generally nae freab soil; but after reading your article, I thought I would teat $i t$, and prove conclasively whether the soil was at fault or not. Well, I really and fally belteve that no more of this eleepy disease will ever trouble me, and to prove the same, I have with my own handa, and on the gyatem which I will a little later on make pablic, planted a a late 90 -feet honse with 300 plants as an experiment. They are now swelligg their first trusee, and if no plante flag or droop by September 1, I shall have the satisfaction of knowing that the investigation I have made have not been in vain. I should say that the house that I have planted had many cases of this "sleepy disease" last year, and the noil is the sama. no this will be a sare teat of the fansue theory. P.F. Le Sveur, Grand Vale, Jersey, June 23.
hYBRID POPPIEB. - In the Gardeners' Chronicle for June 15, Mr. W. Wilke asys he does not believe there has been a true hybrid between a perennial and an annual Poppy, Like him, I heve been trying to crose Poppien, and I have succeeded in crossing the doable- fowered annual Poppy with the orange nadicaule Poppy, which is a perennial. The doubleflowered annual variety was the seed-bearing plant, and I have about twenty seedlinge, but only one has come with foliage and habit very much like nudicanle, and that only has flowered; the flower is the same shape as nudicaule, bat a brick-dust red, quite diatinct from nadicaule. The foliage has the glaucous shade, but not so mach an the annual Poppy. The other aeedinga which retemble the annaal are not yet in flower, but they will open in a few days; they are only about 9 iaches high, and I do not think that they will grow any higher, although they might do so another season, as they have only received two waterings this season, and no rain bas fallen here since she end of March. As I have been crossing flowers and vegetables for several years, I have a fair idea of what a true crons should be. J. Lansdell.
collogyne cribtata in a wire babket.-I enclose herewith a photograph of Coelogyne cristata grown in the connervatory of E. Wells, Esq., Wallingford, which will serve to show how admirably adapted this popular Orchid in for caltivation in wire baskets, and as a hanging plant generally. This apecimen has been two years in a 7 -inch baket, and has borne over 300 blooms this year. Its ivorywhite blonoms were most acceptable early in April and May, and as ite cultivation presents no difficulties, the Coolopyne is a most useful and attractive plant for suspending from the roof of a cool conservatory. Arthur Cooper. [An evidence of very accenfal caltare. Eo ]
young gardeners and whitten characTERS. - f think young men have one great grievance to contend with, and that is being compelled to leave a place without a character, when no reason can be given for refuving to give one. I do not think I can do better than state mpow case, which will help to how what I mean. For the past fifteen monthe I have been employed as a journfyman at a certain place, and I have done my atmont to aphold the good testimonials which I have received from previous employers. This apring I leciderl on making
a move, and asked the hoal gardener if he would yet me into a narsery. His answer was "Nu." Laser on, upon my leaving the place, I asked him tor a character, which ne also refused to give me, With the resait that I had to turn out, and I am now filteen month to the bad. Now, what I wish to know is, if ach a thing ought to be? I think it is acandalous that young gardenere should be oo treated; and was is more trying to anyone than to know that after having done his daty, a "character" is denied him? If gardeners woald only act up to the motto, "D , unto oshers sou would have them do anto you," it would wave a grest deal of needless misery, besiden giving young men much needed eacouragement. H. M. C.

TOO MANY PAN8IE8.--It has been said with some trutb, that we have too many Panier, and too few reully good ones. I have jast opened the catalogua of a noted Scoteh floriat, and I tind is containa 344 ahow varieties, selfs, yellow grounds, and white grounde; sad including ten new varietien offored this season for the first time, enumprates the enormous number of 434 fancy varieties. Really this is smple proc $f$ that there are too many Panaies. An examination of other catalogues would no doub: show that it would be posible to make up a list of 1000 assumed distinct varitien of Pansien. As to how many really good ones could ba aslected from the liata I cannot ventare to eay, and I think it is doubtfal if any abstantial advance has been made in Easligh ahow Panaie during the last twenty ypart. Tae fass is, the ahow Panay is so clonely restricted to a few typea that repatition is inevitable. In the case of the eelf, the colour should be as uniform as possible, whether dark yellow of primrose, or in the case of the white aelf, excepting the central blotch, the absence of colour. The dark eelfa admit of considerable variation from the deepest velvety maroon and velvety black, through bright claret, crimson, pale claret, mulberry, purple, and shades of vio'et to the paleat tint; the yellow salfe vary a little in colour, the pricurose selfs lest, the whites differ in parity. Of courso, thone who are intimate with the varieties see wall difforences which eacape the eye of the casual observer; atill, in nuch numbers there must be conoiderable resemblance. Taicknent of texture, circularity, flatnena, moothness on the edge, and the denaity and symmetry of the blotch, are the leading qualities. In the case of the dark selfs where the blotch is not clearly dofiaed, there is yet a small eye jast above it, and the clearness and vividness of the eye imparts life and light to the fower. Taere is great refiaement in a stand of twelve or twenty-four show Panaies when the blooms are approximately perfect, frenh, bright, even in sizs, displajed well on the stand, and arranged-selfo, yellow grounds and white gruands- 30 a to affurd the most effective contrasts. Mach art and cultirated taste can be displayed in settiag up a stand of show Panies in the beat manner, more, perhapa, than ia the case of any other exhibition florists' flower I am açuainted with. Tuat the Ea,lish sho Pansy has greally declined as a caltivated fower in the southera parts of the country is abundantiv sho wa at the exhibition of the Pansy and Violet Suciety, for very few are seen there, and thone exhibited are brought up by the northern and eapecially by the Scatch floriste. Years ago Hammeramith and other abarbs had their Panay showf, and many grew for competition. There were no fancy Panuies in those days, and the Viola, at we now know it an a bedding plant, wae undreamed of. Then cane that balsful time-more than a generation ago - when a kind of disease infeated the show Panay, and mede it in southern parts extremely difficult to cultirate the sho Pansy for any parpose, and the area of cultivation becme greatly circumacribed, till it has become largely a midland and northera flower. We wat a revival of the show Panay; whether the Pansy and Viola Society will bring it about remaing to be seen. The advent of the fancy Pansy came at an opportung time. Having more tenacity of life, being more vigoras in growth, and hardier in constitution, it moon won ite way into popularity. Untrammelled by the divivions of type which fetter the nhow varieties, it admite of great variation in colour and combinations of coloar; bat aixg of flower, stontness of textare, moothneas, circalarity, harmony in and brillisncy of colours, are all qualities for which the rainert atrive. Bit there is jet a great amount of similarity in atand of twenty blooms of distinct varieties, though there is enough of variation to admit of tharply-
defised distinctive lines, bus yet not to astertire
and welf evident as in the case of the show varieties. But a list of 500 so-called distinct varieties is aomewhat appaliing. Oae-fourth of this number would be more than ample, and yet addition is much more certain than reduction. It is now a good time to sow some seeds of Panaies for ammer and autumn display. Though seed of fias strains of the show varieties is not plentiful, still. with due care, it can be procured. Strains of fice typer of fancy varieties are more plentifal. Syad sown in pase or shallow boxes in light friable soil, soon germinate in a gentle warmth or when kept close in a cold frame. If pricked off iato other boxes, the ssedlings 80 )n grow into sizs for planting oas, and if care'ully movad with som 3 aoil adhering to thair roote, quicklv eatablish themselves. Oue secret in succassfal Pansy and Viola growing daring sammer, is to have a layer of good manure a little way below the roots, and given eppropriate soil and an open apst, the Pansy will atand a chance of bsing seen ats its beat. R. D.

ONIONS.-The growing of Onions to a largn siza is considered by some pardeners as a great achievement, although they are ananimous in stating that big balbs are neither economical in the using, or long keepers. An Oaion that measares 9 inches to 12 inches in circamference will remain longer ia good condition then one of 15 to 16 inches, and the former will be lear ready to start into growth in the spring. At the middle of May this year I had a fine los of Oaions hanging ia a cool-house, which had basn hard frozan for a period of two months. The Oainns of globalar form, viz. Allea Craig, Cranston's Escelsior, and Brown Globs, were rood till the present month. Tu meet all wante, it is my practice to grow Potato-Oaions and Shallots, and to plant a quantity of bulbs which are leas: likely to keep late, early in the spring, on land that is in the shade. B, this mean the supply of green Ohion is kept up all through the early part of the summar, a matter of some importance when the antuma-nown Oaiona are injured or destroyed. I made a new departure this seavon in Oaion mowing, when about the middle of March I found the ground frozan to a depth of 2 feet, except about 9 inch: from the surfac. I pricked up the land, sad sowed the Onion seed in drills. It came ap in first-rate fashion, the drills heving been covered with spens Mashroom-bed manare, bat not trodden at ficas. M. Temple, Carron, N.B.

NEW USE8 FOR JADOO FIBTE.-FArns of many kinda have proved to do so well in this soil, that its great lightness in weight points to its use as very desirable in coveriag the walle of ferneries behind wire-netting, and alsil to mach ligater nettiag boing then necansary. The rapidity with which seedling plants throw on's their roots into this material anggeste the expediency of wrapping a mall quatity 0 it ronad auch plant when they are belug pricked out, especiallv in wach vary dry weather as we havo had lately. W. T., Bishopsteiynton.

## OUR POULTRY

By Harrison Weir. (Copyright.)
(Continued from vol. xvii., p. 781 )
The Indian Gane, an a coloured fowl, comen next, at of much excellence for "table parposes." It is of the Malay type, but with much shorter legg, and of a more aturdy appearance, and is apt, like the Malay, to be rather inclined to rest on the hocke or heel, thus showing in some degree ite past ancestry. The fleah is firm, short in fibre and in quantity, that on the breast being somewhat dry by ecmparison with the old Eaglish Gane, and in some cates is nomewhat hard, owing probably to the almoat entire lack of fat on that portion of the body; which defect, for defect it is, is somewhat atoned by the excess on the back and the abdomen. The feathern are short, hard, and closs, and of varied colouring, wotne being very dark, while others are of a bright intente red, pangled with black, with black and golden hackle; others are of a rich bay colour, each feather being what is termed doubly laced with black. This is connidered by some to be the proper "exhibition" marking, though many, life myaelf, much prefer the old atyle of "pheasant spangle," which given a far brighter appearance. An to length of limb, there is also a
growing tendency toward the Malay tope mich is
much to be regretted, the short lege and thighe being far preferable as a quality for a table fowl. As layers they are very inferior to most other fowls, and incorrigible "sitters." As" fighters" in the poultryyard, they are only sarpased by the Game and Malay:

The Langsban at a table-fowl hav high claims for recogaition as one of the best of our table fowle; in fact, for an "all-roand" variety, it is acarcely equalled, with the excpption of it black lega. Oherwise it is good, and is gaining steadily in the eatimation of the pablic. I am not alluding to the long-legged, gawky, flamingo-typs of birds that is now affected- What are termed Langshan fanciersbat the shorter-legged and far more compact sort. Tuese quare-made bird are more hardy, leas lisble to leg wrakness, are more fleshy, and arrive at maturity much earlier than their "atorky" brethren, and are in every way more deairable.

The breat meat of the Langshan is of the whitest description, and of a rich and excellent davour. When well selected, and compactness of form sought for and obtained, it is often preferred by some to the coarser kind of D rking.
Taey are excellent layer, of fair miz', and of high colour, varying from a deep brown-chocalate to red, and red-tinted pink, and spotted with deep chocolate. Thongh not large, the namber is often surprising, laying often, sa they do, twenty or more consecative days. Taey are good mothers, and the chickens are hardy and eaaily reared, the early hatches withatanding the cold far better than moat fowl.

Tae black-coloured variety is the mot common, though now there are white and blue claiming pablic notice and favour.
( 70 be continued.)

## Trees and Shrubs

## MAGNOLIA WATSONI.

This comparatively new hardy Magaolia has lately been ia bloom at Gunnersbury. The leave are glabrous, obovate-oblanceolate, tapering at the basy into a longish petiole. The flowers, which are produced with the leaves, are 5 inche acrons, of a delicate cream colour, the three oatermost eegmente obovate, spoon-shaped, somewhet feshy, and of dall rosy-pink colour. A fizure is given in the Gardeners' Chronich, vol. xvi, 1894 p. 189.

## SOCIETIES.

## NATIONAL ROSE.

Joly b.-The great annual exhibition of the National Rose Society at the Cryatal Palace wat held on the above date. There have been many despondent forccant this mearon as to the inferior quatity likely to be exhibited at this ahow, owing to the exceptionally inclement season with which growers have had to contend. If the wortit of these forecasts were not falfilled-and we think they were not-at the same time, there was no doubt a falling off in the quality a compared with last year. The extreme trosta in February, about which we have talked so long, had a killing effect in many dictricts, and it was particularly unfortunate that anch an abnormal visitation thould be succeeded by a hot season and long drought. Nevertheless, there were many ntands of excellent $R$ jees at the Pulace ot Saturday last, and individual bloom quit worthy the Suciety's Silver Medals were eavily found, bat unlike the exhibition in the previous week at Glorceater, there were many indifferent collection well.

## NURSERYMEN'S Classes.

Seventy-two distinct Single Trusses. - There were ive com petitors for the coveted Trophy and Gold Modal which ancom pany the 1st prize in this mort important class. Fach com petitor had placed a etased of blooms of the greatest excesllencion possible in such acason, and, sllbeit, there were isferior specimens in every collection; there nevertheles heow
judged worthy of the Silver Meda's were each found in this clase, one of them in Mr. B. R. Cants collection, and the
other in that from Mr. Frank Cant. First-place was awarded to Mr. B. R. CANT, Colchester; and 2nd to Mr. Frank Cant, also of Colchester, who held the trophy during the year just ended. The blooms in the 1st prize ahibit were - Back row: Her Majesty (Silver Medal), Suzanne M. Rodocanachi, Lady Mary Fitzwilliam, Marie Baumann Caroline Testout, Duke of Fife, Marchioness of Dufferin Ulich Brunner, Alfred Colomb, White Lady, Boildieu . Y. Teas, Souvenir d'un Ami, Maurice Bernardin, Marie Finger, Madame Crapelet, Mrs, Jno. Laing, Countess of Oxford, Madame de Watteville, Xavier Olibo, Heinrich Schaltheiss, Earl of Dufferin, Duchesse de Morny, Guatave Pigannean. Centre rove: Marquise de Litts, Beauty of Waltham, Luciole (a pretty bloom, with attractive bronze Wadnam, Lucioce (a pretticult to obtain in such condition), Mrs, Sharman haing, I Bole dor Madome Heari Periere, Chas Iefebre Marchioness of Londonderry, Marie Verdier, Marchioness of Marchioness of Londonderry, Marie Verdier, Marchioness of Downshire, Dupuy Jamain, Innocente Pirola, Duke of Edin-
burgh, Sultan of Zanzibar, Ma dame G. Luizet. V'ictor Hugo burgh, Sultan of Zanzibar, Ma dame G. Luizet. Jeannie Dickson, A. K. Williams, Maréchal Niel, Dr. Sewell
Catherine Mermet, Horace Vernet. Souvenir de S. A. Prince Catherine Mermet, Horace Vernet. Souvenir de S. A. Prince
Dr. Andry. Front row: Ethel Brownlow, Reynolds Hole Merveille de Lyon, Etienne Levet, La Francp, Captain Hay ward, La Fraicheur, Duke of Wellington, Madame Cusin, Jean Soupert. The Bride, Alfred Dumesnil, Marie Van Houtte, Fisher Holmes, Ernest Metz, Crown Prince, Comtesse de Vadaillac, Camille Bernardin, Margaret Boudet, Duke Nadaillac, Camille Bernardin, Margaret Boudet, Dake of Connaught, Countess of Rosebery, Comte
Marguerite de St, amand, and Prince arthur.
Mr. Frank Cant was only a few points behind. In hi tand were good blooms of Comtesse de Nadaillac (Medal) Her M"jesty, Gustave Piganneau, Marie Baumann, Madame de Watteville, Corinna, Victor Hugo, Captain Huyward, Duke of Connaugat, Mrs. Jno. Laing, Horace Vernet, Charles Gater Duke of Albany, Alfred Colomb, Eihel Brownlow, and Earl of Dufferin ; 3rd, Messrs. Harmesess \& Sons, Bedale, Yorks.
Forty distinct varieties, three trusses of each.-The exhibite in this class made a capital display, and the blooms in the lat prize stand from Mr. Frakik Cant were very bright and effec tive. Those which appeared specially good for grouping in trebles were Victor Hugo (excellent colour), Pride of Walcham, Sazanne-Marie Rodocanachi, Duke of Fife, Ulrich Brunner Marie Verdier, Duke of Connaught, Marguerite de St. Amanत Innocente Pirola, Comte de Raimbaud, Baroness Rothschild, Salamander, and Mrs, John Lairg. Mr. B. R. Cant was 2nd, and we noticed in his collection very good trebles of Prince Ar thur, Mrs. Sharman Crawford, Heinrich Schultheiss, Duchess ce Morny, Chas. Lefebrre, Marchioness of Dufferin, A K. Williams, Her Majesty, Mrs. Jno. Laing, and Merveille de Lyon. The 3rd posicion was secured by Mesere. Harkness \& Soxs.
Forty-eight, distinct, single trusses,-Messers. PRIor \& Sows, Co chester, were lst, and their best blooms were Sn-zanne-Marie Rodocanachi, Duchess de Morny, Abel Carriere, Star of Waltham, Marie Baumann, Marie Verdier, Gustave Piganneaui, Horace Vernet, Maréchal Niel, Mrs. John Laing, Countess of Oxford, Bruce Findlay, Français Michelon, Annie Wood, Constantin Petriakıff, and Rrnest Metz. Mr. Hemry Merryweather, Southwell, who was 2nd, showed good specimens of Guatave Piganneau, Comtesse de Ludre, Fisher Holmes, Chas. Darwin, Mrs. Jno. Laing, General Jacqueminot. Mesars. J. Burrell \& CJ., Howe House Nurseries, Cambridge, were 3 rd
Twent; -four distinct single trusses.-The quality in this class for twenty-four blooms reigned very high, especially in the exhibit from Mr. Jwo. Mattock, New Headington, Oxford. Copital were the following: - Dupuy Jamain, Duke of Connaught, A. K. Williams (very pretty and bright), Guatave Piganneau, Her Mr jesty, Horace Vernet, Charles Lefebvre, Comtesee de Nadaillac, Duke of Bedford, and Mrs. J. Laing. The 2nd prize lot came from Wales, and were exhibited by Vre, Stepher Treaeder. Pwlleoch Nursery, Cardiff. The blooms were rather emal', but pretty and bright pevertheless; blooms were rather \&mal', bot pretty and bright Devertheless;
those most attractive were Duchesee de Morny, Alfred Colomb, those most atcractive were Duchesse de Morny, Altred Colozab, Lady Helen Stewart. Courtess of Rosebery. Duke of
Connaught, and Exposition de Brie. 3rd, Mesars. Townsend Connaught, and Exposition de Brie. 3rd
a Sons, Lower Broadheath. Worcester.
Twenty-four dintinct varietier, three trusses of each.- Messers. D. Prior \& Sons, who were 1st, showed excellent trebles of Constantin Petriakoff, Mrs, J. Laing, Heinrich Schultheiss, Alfred Colomb, Fisher Holmes, Duchese de Morny, A. K, Williams, Marie Verdier, Xavier Olibo, Jeannie Dickson, Marie Raumana, and Her Majesty. Mesers. Townsexd \& Sons, Worcester, were 2nd ; and Messra. Geo. Cooline \& Nows, Bath, 3rd.
Eighteen bumches, distinct, oxhibits to be staged in nases or other receptac.es, instead of boxes.-This was an interesting clams, because it afforded a little variation from the usual boxes and flat metbod of showing, and gave a little opportunity to growers to exhibit in a more tasteful manner. Exhibitors were not limited in their ehoice of varietiep, but the space for each collection was not to exceed 6 feet by 3 feet. Messrs. PAUL \& Sows, Cheshunt, who were let, had a pretty group, the sprays of flowera bearing pood healthy foliage, shown in vases. The varieties chosen were General Jacqueminot (I.P.). Etienne Levet (H.P.), Jeannie Dickson (H.t. ), La France (H.T.), François Levet (H.P.), Mrs. Paul (Bourbon), Paul's Cheehunt Scarlet (H.P.), Abel Carriere (B.P), Heinrich Schultheiss(H.P.), Bacchus (a new H. P.), Caro(B.P ), Heinrich Schultheiso(H.P.), Bacchus(a new H. . .), Caro(H.P.). Alfred Colomb (H.P.), Suzanve-Marie Rodocadachi
(H.P.), Countes of Oxford (E, P.), Captain Christy (H.P.), (E.P.), Countess of Oxford (E,P.), Captain Christy (H.P.),
and Juke of Edinburgh (H.P.), Mr. Gko. Mourt, of Canter-

## bury, was 2nd in this class; his best were Fisher Holmes, Marie Baumand, Gabrielle Luizet, and Niphetos.

## Tel and Nolsette Section.

Twenty-four distinct single trusses. The principal prixe in this section was well won by Mr. Frank Cant, who has exhibited Teas very succesefully this season. His collection in this class was of excellent quality, judged by the average merit of the exhibition. The blooms staged were the follow-ing:-Back row: Ernest Metz, Madame do Watterille, The Bride, Niphetos, Madame Cusin, Souvenir d'Elise Vardon, Comtesse de Nadaillac, and Innocente Pirola; Centre row Catherine Mermet, Souvenir de S. A. Prince, Ethel Brownlow, Maréchal Niel, Souvenir d'un Ami, Hon. Editb Gifford, Maman Cochet, and Souvenir de Paul Neyron; Front row Cleopatra, Francisca Kruger, Bridesmaid, Marie Van Houtte, Madame Jacquier, Rubens, Corinna, and Jenn Ducher. Mr. B. R. Cant had blooms of smaller size, but otherwise they were good, being bright and fresh-looking. Madame Cusin was splendid; Devoniensis, Madame de Watteville, Ernest Metz, Innocente Pirola, Bridesmaid, Corinna, and Catherine
Eighteen distinct single trusses. - There were nine entries for this class, and consequently the quality of the prize collections run very close. The 1st position was taken by Mr. Jwo Mattock, New Headington, Oxford. In his stand we noticed as the best specimens, Souvenir d'un $\mathbf{A m i}$, Hon. Ed. Gifford, Adnm, The Bride, Efnest Metz, and Catherine Marmet. Mr. Henry Merryweather took 2nd, and he had good Catherine Mermet, Cleopatra, and Epnest Metz, \&c., smaller in size than the first exhibit; 3rd, J. Burrelt \& Co., Howe House Nurthe first exhibit; Cambridge.
Eighteen distinct, three trusses of each.-There were five colections shown in this class, and of these the best was one from Mr. Frank Cant. The stand contained several very fine trebles, but was nevertheless much marred by a few inferior apecimens, such as those of Francisca Kruger. The best were Madame Cusin (very good), Catherine Mermet, Madame de Watteville, Souvenir d'un Ami, Rubens, Innocente Pirola, The Bride, Ethel Brownlow, Comtesse de Nadaillac, \&c.; Mesers. The Bride, Ethel Brownlow, Comtessede Nadaillac, acc.; Messrs D. Prior \& Sons were 2nd with a fresh collection, bright and
clean, but small, Maréchal Niel, Madame Cusin, Ernest Metz clean, but small, Maréchal Niel, Madame Cusin, E,

## OPEN CLASSES.

Twelve trusses of hybrid Teas, not fewer than nine varieties. -The hybrid Teas are now fully recognised by the Society, and have a special class to themselves. The class is a popular one and there were eight or more entries. The lst prize was won by Mr. Frank Cant, and the names of his varieties were Augustine Guinoiseeau, La France, Viscountess Folkestone Lady Mary Fitzwilliam, Caroline Testout, Kaiserın Augusta Victoria, Duchess of Albany, Grace Darling, Danmarck, Germaine Caillott, and La Fraicheur ; Mr. B. B. Cant was a close 2nd; his La Fraicheur was excellent; Captain Christy and Kaiserin Augusta Victoria were also good. Mr. Geo. Prince Oxford, who was 3rd, included a very fine bloom of Kaiserin Augusta Victoria.
Twelve trusses of any yellow Fose axcept Maréchal Niel.This class was won by Mr. Geo. Prince, Oxford, with a stand of moderatel y -good Comtesse de Nadaillac; Mr. Joen Mıtтock, who was 2nd, sbowed the same vanety; and Mr Erank Cant with Marie Van Houtte, was 3rd.
Twelvs single trusses of any white Rose.-Mr. GEo. Mount won with good specimens of Merv
Twelve single trusses of any crimson Rose. - With very bright, but slightly damaged blooms of A. K. Williams Messrs. Townsend \& Sons were lit, being followed by Mr B. R. Cant, who had Guatave Pigannezu, and Mr. Gro MOUNT, who had good Ulrich Brunner.
Twelve single $t$ usses of any dark velvety crimson var iety. Mr. B. B. Cant and Mr. Geo. Moust were awarded equal lats for two fairly commendeble stands of Fikher Holmes 3rd, Mesers. G. and W. H. Burcir, Peterborough, with Horace Vernet.
Iwe've single trusses of any light Rose.-The 1et prize ex hibit in this class was a stand of twelve blooms of Mrs. Roses in the exhibition. Certainly the brighteat of all th light varieties, it is at the same tiase pretty and attractive in tone. The blooms wera showa by Messra. Alex. Dickson \& Sors, Newtownards, Ireland. 2nd, Messrs. D. and W. Croll Dundee, who had extra nice Mrs. Jno. Laing, and the same variety was showa by Mr. Mrank Cant, who was 3 子d.
Tweivs single $t$ russes of any Rose except a Tea op Noisette. There was coneiderable comperition in this as in a fow other of the ee single rariety classes. Mr. Trank Caxt, who was placed lat, had extra good blwoms of Her Majesty, very full and bright; and Messrs. Paul \& Sory, Chesinunt, were 2nd with the same variecy; while Mr. B. R. Caxt, who had Marchioness the same vaniecy; whit
Twelve single trusses of any Tad ar Noisctifo-Mr. B. R. Cant was 1st, with a dozen nice blooms of the lovely Madame Cusin: Mr. Frank Cant was 2nd, trusting to Madame de Watteville; and Mr. Jas. Matrock obtained 3rd with Erneen Metr.
Twelve single trusses of Marechat Niel.-This clnes was only poorly anstained. Messrs. Pri
Meagrs. Townsern \$ Soxs, 2nd

## NEw Roske

The clasees here were of more interest than last season Mesrs. A. Drcisson \& Sows, of Newtownards, staging a good twolve of Mrs. Sharman Crawford, a Roee of great merit and
useful colour. Mr. F. CANT, Colchenter, was and, wilh
Marchioness of Londonderry; and Messrb, PAUL \& Sun Cheshunt, 3sd, with Jeanme Dickeon. Similar to last season all three winning stands were rased by the Irrsh firm.
Twelve var ieties, distnct. - Messrs. A. Dlekson \& Sons were also lst in this competition, showing Mrs, s. Cran ford, Shamrock, Avoca (a Tea like Frnest Metz, but brighter), Captain Hayward, Marchioness of Downshire, Tom Wood (a pretty Rose, between Madame Cusin and Souvenir de David in colour, but brighter and more full), Lady Moyra Beauclerc, La Fraicheur (good), Marchioness of Londonderry, Helen Keller, Mavour neen, and Muriel Grahame ; the last is a good and promisin Tea, with habit and form midway between Madame Bravy and Catherine Mermet. The colour is almust white, with creamy shading-an undoubtedly promising Rose. Murie Grahame was also staged for the Gold Medal, as was Countese of Caledon. Mr. W. Tailob, Hampton, showed a new Roee called Robin Lyth, which we consider is too near to Fisher Holmes and Harrison Weir. The new Tea, Muriel Grahame, was decidedly the best of those now staged for the first time.

## Garden Rosks

These were not so good as usual, and, as at Gloucenter, the hot season has evidently been too much for them.
Nursertmen: Thirty-six bunches, distinct. - Mersts. G. Cooling \& Sons, Bath, 1st, having L'IC éale, W. A. Richardson, Cooling's Searlet Perpetual, G. Regie, and Pepita being among the best. Messrs. Paut \& ${ }^{2}$ on, Cheshunt, and $F$. Cant, Colchester, were 2nd and $35 i$ with much the same varicties.
Eighteen bunches, distinct.-Messrs. Towxsumex \& Sor, Worcester, and Mesers. D. \& W. Croll. Duadee, were successful. The first-named had Madame Falcot, Madame Charles (good), Celine Forestier, and Isabella Splunt; whale Mears. Croll had a pretty bunch of Madame C. Brunners (Poly antha).
Amateurs:-A siloet cup prosented by the Rit Hon. Lood Penzance for eightsen bunches of Garden Roses, wae won by H. V. Macein, Esq., Worksop, who had very good bunches, but rather too cramped in arrangement. Tho 2nd prize atand from Mr. A. TaTE, Leatherhend, was certainly the most admired and best sat up stand; O. G. ORPEN, Eeq., Colchetter, was a good 3rd.
In an open class for twelve bunches of Roses suitable for button-hole flowers, Mr. J. Mattock, Onford; Mesors. W. Townshend \& Son, Worcenter; and Mr. A. EVANS, Oxford, were succesaful; W. A. Richardson, Madane Falcot, Ma Capucine, L'Idéale, and Madame de Watterille, being the varieties most bhown.

Nine bunchas of Single-flowered Roses. - Mesars. Q. Paut \& Son, Cheshunt, met with no opparition; Moschata alba, Lucida, Rugosa, and Pissardi were the best.
Mr. Mattoce, Oaford, had a very pretty lot in the "di-play of Roses ' (open), and was followed by Menors. Townsemp \& Son, Worcester.

## Medal Roses.

Bennett's Rose, Her Majesty, won the H. P. medale in both Nurserymen and Amateur Classes, and were exceptionally good throughout the show. Mr. B. E. CANT and E. B. Lindselle Kaq., were the winners. A large, bat rather loose, Comtese do Nadaillac was succasoful among Tea and Noisettes, for Mr. F. Cant; and Maséchal Niel for the Rev. A. FosterMelifar. The latter flower was also loose, but had once bee magnaficent.

## amateurs.

The Champion Tiophy Class, thirts-six booms, distinct. This class was open to all amateurs, and the coreted Trophy and Gold Medal went to Mr. E. B. Iivisell, Hitchin, who otaged some good flowers. His back row consisted of Her Majesty. 8.-M. Rodocauachi, Mrs. Faul, Earl of Dufferin Marchiones of Londonderry, Ulirich Brunner, Mrs. J. Lsing A. K. Williams, Merveille de Lyon, Charles Lefebrye, Madame E. Verdier, and Gustave Piganneau; midale row. Duchess o Bedford, Souvenir d'Elise, Dupuy Jamain, Caroline Kuster, Alfred Culomb. Gabrielle Luizer, Duke of Wellington, Duchese de Morny, Fisher Holmes, Comtesse de Nadaillac, Madame Husmann, aud Mrs. Sharman Crawford ; the front row being Catberine Mermet, Louiv Van Hoatte, Innocente Pirola, Prince Catherine Mermet, Louil Van Hoatte, Innocente Pirola, Prince
Arthur, Abel Carriern, Dr. Andry, Pranco's Michelon, Duke of Connaught. Etoile de Lyon, Maurice Bernardin, Marie Ver dier, and Dr. Sewell. Perhaps the worst flower here was Comtesse de Nadaillac, all of the rest being oven better than those in the professional classes. The Rev. J. H. Pembertond Havenng-atte-Bower, was 2nd, his boat being Her Majesty Horace Vernet, Xavier Olibo, Dachees of Bedford, and peculiarly-striped Marie Verdier. T. B Haywood, Eeq, Weculiarly-striped Marie Verdier. I. Bo Haywoon, Esig. collection.
$\triangle$ prece of plate. givan by Mr. Frant Cant for forty-oight singles, also went to Mr. K. B. Lindesli, who put up math the same varieties as in the trophy clase. Alirud Colomb Louis Van Houtte. and Marchioiese of Londonderry wore extra guod. Mr. Walter Drew. Ledbury, mado a elose zad, and was followed by Mr. A. TıTE. L-atherhend.
For trounty-four singles, J. GURaEy Towier Beq, South Woodford, Ensex, was lst, staging good ex mples of The Bride, Dr. Andry, Raynolds Hole, Harrison Weir, and A K Williams among others; Mr. W. Bores, Derby, beating the Rev. A. Foster-Mflliak, Ipswich, for 2nd honours. There was a particularly good Horace Vernet and Prince Arthur in Mr. Boyns's and, and a very full Merveille de Lyon in the Rev. A. F. Mellisa's.
For twenty-four, distinct, sung'e t. usses.-This division was open only to growers of ferer than 2000 plants of exhibition variety, and here W. C. Romarse, Erq., The Priory, Windsor,
-at 1at, the blooms of Mone. G. Laizet, A. K. Williams, The Bride, Horace Vernet, and A. Colomb, being very good; Mr. A. Slaughter, Steyninf, was 2nd, but had rather over-dreseed his blooms: without this, we think it probable the lit would have been awarded to him. The stand contained good blooms of Madame Alfred Vy, Prince Arthur, and Madame Cusin; Rer. H. Beaners, Harkstead Rectory. Ipswich, was a close 3rd, his h. Bet flowers boing Comille Bernardin and Mdlle. Gabrielle Luizet.
Luizet. Fur eighteen, dintinct, sinjle trusses, J. PARRFR, Esq, nakfield. Hitchin, was is front of Mr. E. Mawley, Berkhamsten, Herts; E. M. BetEune. Eeqoo Horsham, Mowl ng. Inocente Pirola, Charles Darwin, Gran Mon Hoatte Baroness Rothschild, Her Majesty, and
were the beest six in the let prize etand.
For nine truses of any Rose not a Tea or Noisette, the Rer H. Bervers, Ipawich, wis lit, with Mrs. John Laing; Mr. A. glaverter coming close with Charles Lefebvre; and E. M Betgusen Eqq., was 3nd, with some good blooms of Captain Chirty.
In an extra cbiss of eight diutinct ourieties. three trusses of
In an extra ch 18s of Ent distchin. was again well in front, the rarieties being Her Majesty, Souvenird'Elise, La Fraace, Earl uf Dufferin, Ulrich Branner, Mrs. J. Laing. Caroline Kuster, and Alfred Colomb; Mr. A. Tate, Leathernead, was 2nd, and had very clean trebles of Charles Lefebrre and A. K. Williams. The Eev. J. H. Pembertoa, Havering atte-Bower, being 3rd ta a very strongly contented class.
Tiotoe Bunches, not more thar sev.n trusses to a bunch.Rev. J. h. Pempertor was 1st, with a pretty lot, which conrained a good bunch of Gloize de Bordeanx, an old Rose not met with olsewhere in the show. H. V. MACHix, Esq., Gatoford Hell, Worksop, was 2ad, Viscountess Folkestone, and M. de Lyon being worthy of epecial notice.

In the division opes to growsers of fewer than 1:00 plants, the class for nine distinct single trusses, was etrong. Mr. J. Bateman, Roee Vale, Archway Road, N., taling 1st, with Charles Lefebvre, Her Majesty, Countess of Rosebery, S.-M. Rodocanachi, and Beauty of Walthom, very kood. The Rev. H. B. Brrox, The Vicarage, Ls mpne, had a plendid Marie
Baumann in his 2ad prize atand; M PAREER, Uld HadingBaumann in his 2od p
ton, Oxford, was 3rd.

Six dist net, three trus es of each. - In this clase, P. G. C. Burvard, Fiq.o Reigate, won with Duke of Edinburgh, M. de Lyon, U. Branner, General Jacqueminot, G. Luizet, and Rarones, Rothechild. M. WHITTLE, Esq., Leicester, and J. Parker. Req.. Oxford, followed. In the ith prize atand. from O. G. OnPEx Eeq Colchester, there were extra good from O. G. OnPEX, Eqq. Colcheater, there
treblee of M. de Lyon and Innocente Pirola.

Nine duthnet single trusses.- A division for growers of lese than 500 plante of exhibition varieties was one of the strongest in the show. H. Posmre, Eeq, Ashford, was lat, having good flowers of abel Carr ere and Duke of Connaught; 2nd, H. P. Langdon, Esq. Brentwood; 3rd, Mr. G. Moules, Hitchin, with grod stands.
Fur rix Sing'es in the same divivion, E. R. Smite, Erq, Mnswell Hill. N., won with a very clean and bright hox; the Rev, G. E. Jeans, I-le of Wight, and W. D. Fresefisid, Req., Reigate, following in the order of their names.
Four distinct varieties, three of each.-A. Evans, Esq, Marston, Oxfo d: W. D. Fresefield, Eaq.. Reigate; and Miss E.B. Denton, Winduor, won in like order, Mp. EVANs having Horace Vernet and Marie Bammann very good.

An extra c'ass of twelv: singles wan made for the Challevge Cup, offered by Memrs. Harkness \& Sont, Bedale, Yorkshire. Ten comperitors staged here, the winner being O.G. ORPEN, Esaq.. Colchester, who staged Merveille de Lyon, Ulrich Branuer, Inoocente Pirola. Dr. Sewell. A. Colomb, The Bride, Envest Motz, Ostherine Mermet, Souvenir d'un Ami, A. K. Williamf, Comtesse de Paniser, and K. Augusta Victoria, the lut two being excaptionally good. P. G. C. Burnard. Esq. Reigate : M. Waitrle. Eqq., Leicester; and Conway Jones Esq. Hueclecote, Gloucester, following in the order of their Est. Hucclecot, Gloucester, following in the order of their names. Thare Was a goo
Mr. Conway Jones' box.
For six trueses of any Rose excopt Tea of Noisette, J. Pareer, Epq., Oxtord, won in this class with Her Majesty; Mr. S. KRXCE, Heanor, Derby, following, with Mrs. J. Laing; and Dr. TuCker. Swanley, taking 3rd, with Ber Majesty.
Six distinct truscer, open on'y to thase who have never won a N. B. S prizs-Tirat prize a piece of plate, given by the Rev. J. W. Merlor, was secured by C. E. SHea, Eiq., Foot's Oray, Keat, who put up Eenateup Vaiser, G. Piganneau, Dr. Andry, Dachesse do Morny, H. Schultheise, and Marie Baumann io good form; but was clocely run by F.W. Cay piow, Eeq, Colley Manor, Reigate, whose box had a purticularly good Prince Arthur; F. Denmisox, Eeq., Handsworth Wood, Burmingham, wa 3rd.
Six singles, open on "y to members who have joined the National Rose society sisce the last Metr politan show, found R. W Bowyer, Rug., Haileybury College, Herta, and L. Parce, Enq. Derby, very close competitors; Mr, R. F. Hobss, Worcester being 3ut.
Six distinct Rises, th bl srown within eight mites of Charing Cross, for s piece of plate given by E. Mawley, E (eq, was Won by K. H. Girford, Req. Streatham, with Pride of Wiltham, G. Pigunneau, Mrs. J, Laing, A. K. Williamm Fisher Holmew, and Charles Lefebvre, the last three being extra bright and good. E, K, EMTTH, R-q., Musmell Hill wis a cloes 3nd; and R. H. Lavarow, Beq., Hendon, Ird.
Tweles distinte, single trusses, to be growow within leve miles of Charing Cross,-The stands shown were also good W. Hodesox, Eeq., Shirley Cottage, Croydon, being Ist, and having Victor Hugo, Prisce Camille de Rohan, Fisher Holmes,

General Jacqueminot, and Dule of Conaught in fine form: A. Beyfus. Esq. Norwood, and Mr. H. W. Dews, Beckenham, were 2ad and 3rd respectively.
Six distinat New Roses, single trusses.-The Rev. J. H. PEMbertor won with La Fraicheur, M. of Londonderry, and M. of Downshire as the best; F. Mawley, Esq. Berkhambeing the best vanieties in this stand.

Eighteen distinct, single trusses, open to all amzeurs, -The Tea and Noisette Trophy, also the Gold Medal, were won by O. G. Orpen, Esq., Colchester ; E. Metz, Innocente Pirola, The Bride, Souvenir d'un Ami. Souvenir de S. A. Prince, Catherine Mermet, Anas Olivier, Madame Hoste, Maréchal Niel, and Marie $\tan$ Houtte, were very clean and good blooms. A capital Made of found in the Rev. A. Foster-Melitar's stand, whose bod w a found in the Rev. A. Foste Mréchal Niel, La Boule d'Or, Etoile de Lyon, and Madame Hoste; the Rev. H. Bervers, Ipowich, a close 3rd, had May Rivers, Souvenir d'Elise, F. Kruiger, and The Bride, good.
Twelve distint singles, open.-O.G. Orpear, Esq., was again to the front with a clean lot of blooms; E. M. Bethune, Esq. Denne Park, Horsham, had good blooms of Madame Cuz in and Innocente Pirola, in his 2ad prize stand; 3rd, Rev. H. Berners. A good Madame de Watteville in Mr. A. TATE: tand is deserving of meation.
Eight treb'es, distinct. - A piece of plate given as a memorial of the late Rev. the Hon. J. Townshend Boscawen, was in this class won by O. G. OpPEN, Req., Innocente Pirola, C. Mermet, Rubens, Souvenir d'un Ami, Alba rosea, Marie van Houtte, The Bride, and Comtesee de Panisee, being the varieties that he showed. The Rev A. Foster-Melliar and H. V. Macein E\&q., Worksop, were respectively 2nd and 3rd.
Nine single trusses of any Tea or Noisette Rose.-O. G. Orpers, Eaq., the Rev. A. Foster-Melciar, and the Rev. H, BERMERS were successful ia the order of their names, $\boldsymbol{F}$. Kiufger C. de Nadaillac, and Madame Hoate being the varieties.

Twalve singles, distinct, open only to thase who grow fewer than 500 plants.-18t, Conway Jones, Esq., who had very good blooms of Niphetos and Ethel Brownlow. Mr. J Moules, Hitchin, and Mr. J. Parker, Old Headington Moules, Hitchin, and Mr. J. Parrer,
Oxford, were placod 2ad and 3rd as named.

Nine singles, distinct.- In the same division, R. H. Lavg ton, Esq, Ryymead, Hendon, wh 1st, the blooms of $k$ Brownlow ani Madame Cuzin being good: Mr. A. Evans, Marston, Oxford, and W. C. Romaine, Rsq., Windsor, were and and 3rd respectively.
Nine distinct single trusses, same division, for growers of fower the th 200 plants.-Mr. J. PaBKER, Old Headington, Oxford, had the beat lot here, Mr. T. A. Washbourne, Gloucester, and W. D. Freshrield, Eaq., Reigate, following. This was a gooj class throughout.
Six singles, sume conditions.-G. W. Cook, Esq., Torriogton Park, North Finchley, was awarded an equal 1st with the Bev. F. B. Burnside, sutton-on-the-Hill, Derby. Mr. Cook's best flower was The Bride; Mr. Burxside's F. Kruger, Madame Hoste, and I. Pirola were very grod; the 3nd wat withheld, and Mr. J. Moules, Hitchin, was 3rd.
In an extra class for four varitties, three of each. Coswar Jones, Eaq., won with E. Metz, I. Pirola, Niphetos, and Cumtosee de Nadaillac; R. H. Langton, Esq., Henjon, and W. Botes, Esq., Derby, being 2ad and 3rd.

Six of any Tes or Noisette Rose.-Mr. A. Evans, Oxford, was let with Marie Van Houtte, Mr. W. D. Freshrield Reigate, 2nd with the same variety, und Mr. R. Mawley 3rd with Souvenir do S. A. Prince.
Nine bunches, distinct.-There was only one exhibit for Messer. Paul \& Sos's prize, Mr. J. Parker, Old Headington, Oxford, being awarded litt.
Six single tmusses, distinct.-This was open only to amateurs who have never wou a prize at the National Rose Soviety's exhibition. 1, At, B. Boyer, Eeq., Hailebury College, Herts, with a pretty lot; Mr. K. H. GIfford, Streatham, and Mr. J. Pegare, Beeston, Noctu, following.

MI3CELLANEOUS EXEIBITS.
Mosars. WM. PAul \& Son, Walthsm Crow, Herts, ataged a large collection of Roses in baskets, incluling about iwenty Farietien raised in the nursery at Waltham Oross. Amongst the latter we noticed the axcellent fiesh-coloured Clio (H.P.), and spenser (E.P.). Folyaniha varieties, Teas, Hybrid Teas H.P.'r, and others were well represented.

Mr. W. Rumsey, Joyning's Narsery. Waltham Crows, was Also an exhibitor of a grod collection of Roses, amongat which Wo noticed nice baskets of L'Idéale, Wm. Allan Richardson Reynolde Hole, to. Mr. Cras. Turaer, Royal Nursery, Slough, had arge tible contaiung profusely-flowered branches of Turner's Crimson Rambler, some of which were 6 and 8 feet high.
Mesare. Wallace \& Co., Colchester, had filled a table with sprays of Lilies and Calochorti.

Two excellent groups were made by Mears. Jwo. Lifwe a Soms, Forent Hil, Landon, 8. R. Mmert. CEEAL LiNG Sons, Lowfield Nursery, Crawley, exhibited a nice collection of hardy herbeceout flowers; and Memrs Jackmar to Soxs had milar exhibit.

ROYAL HORTICULTURAL Jour 9.-The uanal fortnightly meeting of the Society was held on Tuenday lat in the Drill Hall,
numeron, and many of botanical interest were shown. Competitive classes for Roses occapied rather more apace than one of the large tables afford, Plants and flowers in season were shown by several exhibitora, and the Frait Committee had numerou exhibite before them. On the whole, however, the Hall was less full than at several of the preceding meetings.

## Floral Committee.

Present: W. Maraball, Eeq. Chairman; and Mears. Jno. Fiaser, H. Herbst, Geo. Stevena, H. B May, J. Jenningy, J. Barr, E. Beckett, C. Blick, Rev. G. H. Engleheart, J. T. Bennett Pcê, C. J. Salter, and J. Liting.

Messrs. Daniels Bros., of Norwich, exhibited some very strong epraye of a variety of Godetia, named Marchioness of Salisbury, a very free and large fi owerer, being nearly 4 inche across, colour scirlet, margined with white, and white centro (A ward of Merit)
(Award of Merit). bited plants of a Godetia named E. F. Fairbairn, colourscarletcrimson, with lilac centre.
rimson, with lilac centre. Spraye of a good Ivy-leaved Pelargonium, named Queen of
Roses, was shown by Mr. G. Daniells, Lime Tree Rosd, Norwich.
Messrs. SuTron \& Sons, Reading, exhibited in a large box, plants of the South African annual Nemesia strumosa. Variou shades of colou
Mr. Henry Fckford, Wem, Shropshire, exhibited sprayt of varieties of Sweer Peas, shown in about fifty glasses, and in extraordinary variety of colour-Captivation, purple; Countess of Aberdeen, flesh colour, very pretty; Queen Victoria, cream: and Lady Grisel Hamilton, pale bius, an among the best and most distiact of the newer varietie (Silver Banksian Medal).
Messers W. Cutbusf \& Sons, Highgate, London, No, exhio tited two plants in flower of Carnation La Villette, flowen rose and yellow; and Mr. H. Becker Jersey, sent plants and blooms of a border Carnation named Jersey Maid; the flowen are blush-pink, changiog to white, very large, and abondantly free.
Mr. Chas. Turyer, Royal Nurseries, Nlough, exhibited flowers of Carnations and Picotees in variety; tha flower were good in quality, bright, and treeh (8ilver Banksian Medal).
A double Petunia named Laura Minnie Beldam came from Mr. A. BELDam. The Lodge, Acton; and Mr. H. Middet HURST Manchenter Street Liverpool, showed blooms of Chrysanthemum maximnm
Mesors. Jwo. Laing \& Soms, Forest Hill, London, 8. Fion staged a few tuterc $u+$ rooted Begonias, and were recommended an Award of Merit for the variety Mr. F. Bostock, a neat woil formed double flower of excellent crimson-scarlet. Also ton Streptocarpus Laiog's multiflora. The flowers are lerne bluish-purple, with purple-lined throat. There were thirs open flowers borne on the plant in a 5 -inch pot.
Menis. Dobbie \& Co. Rothesay and Orpington, wart recommended Firat-clasa Certificate for Arnebia comuts The plant is an annual of rather straggling habit, and grow apparently about 12 inches high. The flowers are small, yellow in colour, but each petal marked on most of its suriap with velvety purple. The plante blocm very freely, but pot many open at one time.
Mr. Anthony Waterer, Knap Hill Nursery, near Woking exhibited aprays of the dark-coloured variaty of 8. Bumalith known as Anthony Waterer, and also sprays of a very delicets light variety named Margaret.
Meesrs. P. Barr \& Soss, King Street. Covent Gandan, London, itaged a brilliant collection of hardy perennial herbaceous flowera. Bunches of Anthemis tinctoria, Eryagiume Malva moschata alba, Lilium Browni, L. candiducn, L. tent ceum, L. Krmmeri, varieties of Poppies, \&C., were noticul (Silver Bankaian Medal)

## G. A. Furivi Medal)

G. A. Farini, Esq., Perty Vale, Forest Hill, showed a doubly Begonia named Farini'a Striped, the centre petals striped with yellow, reat of the flower scarlet.
Messrs F. Bayder a Co., 8t. Albans, agaia showed play of Dipladenia atro-purpuren in flower, also D . boliviensis, at oxcellent lot of plants of Rriocnems Savderse, and a number of hybrid varieties of Bonerilas, beaide dozen plants d Diones Muscipula.
Me ors Jas. Veltch \& Sons. Royal Exotic Nursery, Chelsath howed apray of Rremurus Bungei, a mpecies growide aboul is feat high ; the colour of the flowers is light bright yellowi It is one of the prettieet of the genus. An Award of Meril was recommended to an excellent plant of Begonis $X$ car minata, a hybrid from B. coccinea $o$ and B. Dregeid". The plant is robust, very tree flowering, and the bloseoms are corn red in colour, and very much lapger iuse than either paresi Memern. Paul gous, Cheahuat, exhibited blooms of the new Boses Bacclas and Alan Cheal, noticed on a previa occasion; and also new H P. Rose named Haylenhury, bright rose-coloured bloom. campact, and of good size, wit petals of metiuse length (A ward of Merit).
Mise MCROWald, Northgate Nursery, Ohichester, whe reoom mended an Award for Caration Mrs. W. Bright, col00 bright jellow, flower of gaod form, and calyx non-splitting most cases.

A collection of Delphinium sprays wat sts-el by Mr. FORBEw, Hawick.

A very interesting exhibit of Lifies and allel flower whs made by Meanre. Waliace \& Co., Cilcheste: In Thin bergiamum is variety, $\mathbf{L}$ 。 dalmaticum, L. pardalin um Beurgell
moet of them of the lerpe-flowered section. Awards of Merit were recommended to Calochortus luteus concolor, a very delicato and pretty jellow variety; and to C. macrocarpus, a very large flower of mauve purple with yellow hairs
at bese. The greatest povelty, however, was a spray of flowers of a species of Hemerocallis, at present under the name of H. aurantiaca. Apparently the plant
grows mbout 2 feet high, and bears numerons bloseoms of grows about 2 feet high, and bears numerons blossoms of 1 inch wide, and the flower probably 8 inches across. A Firstclass Certificate was recommended to this acquisition, and a Silver Flora Medal for the group.
Mr. Jas Dovglas. Edenside Nursery, Great Bookham, had few blooms of Carnations: Mise Addyy, primerose yellow Haye's Scarlet, Lady Ridley, white; and Grace Dariing.

## ROSES.

Competitive classes for Roses were regarded as the principel feature of Tuesday's meetinc, but the Vational society's Crystal Palaoe exhibition haring previously been held there was not the amount of interest exhibited as at carlier shows. The
blooma must be deecribed in similar terms to those wave already used in regard to those shown at the Palace. Many of them were worthy all praise, but a good number wore inferior and on the whole they were not remarkable for high quality. though it may be added. they are far better than we could have expected in the face of di
to overcome this season.
The lst class for twenty-four sincle trusees (amateurs), not more than two of any one variety, was won by E. B. Limpsell. Eeq., Bearten, Hitchin, he had firet-class hlooms of Earl Dufferin. Marie Baumann, Ulrich Brunner, Duke of Wellington, and E. Y. Teas. T. B. HAYwood, Eeq., Woodhatch, Rejgate (gr., Mr. C. J. Balter), was 2ad, with pmaller, younger, and
pretty blooms.
Twenty-four single trueser, distinct (op n).-Mr. FRANE Cant, Braiswick Nursery, Colchester, was lst in this clase, and his stand contained mome very good blooms, notably Suzanne-M. Rodocanachi, Mrs. J. Laine, Marchioness of Londonderty, and Victor Hugo; 2nd, Mr. B. R. Cavr. Colcbester. Twelve single trusses, distinct (amateurs).-J. GUBNET Fowler. Esq., Glebelands, South Woodford (Gro, Mr. J.
Davis), was the winner here, and of the blooms ahown we mavis), was the winner here, and of the blooms shown we Orper. Feq.. Hill Side, West Bergholt, Colchester, was 2nd.
Twelve single trusses, distinct (open).-Mr. B. R. Cant was the beat exhibitor, and had noticeable blooms of Gustave and prize was taken by Mr. GEo. Mount, Canterbury, who had a very equal lot of fair quality.
Six single trusses, dietinct (amateurs), was won by R. H. Lanaton, Esq., Baymead, Hendod, N.W. His blooms were fairly good. They were Ulrich Brunner, Her Majeaty, La France, Gustave Pignnneau, Merveille de Lyon, and A. K Williams. 2nd, R. H. Gifrord, Eeq. Holyrood, Streatham.
Six sungle trusses of one variety.-A. K. Williams was shown in good cordition by T. B. HAYWOOD, E\&q., who was : and alao by the Bev. J. H. Pemberton
Twelve distinct, three trusses of each. - This clasp, for twelve trebles, was awarded to Mr. B. R. CANT, who had blooms of con siderable quality: but Mr. Geo. Mount's Canterbury exhibit Was very fine, and the blooms exceedingly even. In our opinion Mr. Mount's was the better collection.
Troelve single trusces of any one variety (oprn),-Mr. B. R. Cant showed well here, having Gustave Pigannenu; and Mr
Geo. Moukr, with Fiaher Holmes, was Ind.

Teas and Noisettes.
Twenty four single trusses, not fower than twolve varieties, or more than three trusses of any one variety (amateurs). O. G. Orpen, Eeq., was lst, but his blooms were not extre good; E. V. Mıcein. Eeq., Gateford Eill, Worksop, was 2nd. Six single trusses, not less than four varietien. -Thim claes was won by R. H. LANGTON, Esq. with nice blooms; Com-
tes-c de Nadaillac and Princess of Wales were noticeable. Esq., was the wianer in this clasy (amateners).-R. H. Langton, Pirols: O. G. ORPER, Esq., being 2nd, with indifferent Souvenir d'un Ami.

Twenty-foup distinct single trusses (open)-Mr. FBANK Cantis lat prize exhibit whs of fair quality. The collection contained a large but not particularly pretty bloom of Brideomaid. Mr. B. R. CANT was 2nd.
Tweloe distinct, three trusses of each. -Mr. FRank Cant was the winner for twelve irebles, and Mr. B. R. CaNt and ncluding in this collection for twive distinct single trusuen Ernest Metz.

## Orchid Oommittee.

Present: Henry J. Veitch, Esq., in the chair ; and Mensrg. Jas. O'Brien (eecretary), T. B. Haywood, Dr. M. T. Mastery, Sydney Courtauld, Dr. B. CrawShay, E. Hill, H. J. Chapman, W. Cobb, W. H. White, J. Doaglas, C. Pilcher, and H. Williame.
A number of Orchids of exceptional botanical interest appeared at this meeting, the showy species being in the mainority, as witness the fact that not one was selected for a Firsit-clase Certificate, while only four, three of which were Rell-kwown old plants, received Awards of Merit.
Rich in interesting and beautiful botanical plants was the small group staged by Bir Trutor Lawreace, Barto, the President of the Society (gro, Mr. W. H. White). Aroong theee was a plant of Luddemannia Pescatorai, prith twog of the
pendent inflorecences thickly clad with orange-coloured flowers of singular structure. The flower-apikes are asid to attain at times a length of 3 feet. When thoroughly ostablished, it will form a very handsome plant (Botanical Certificate). Trichocentrum bymenanthum, the pretty little
Masderallia guttata, and the roee and parple Oncidium olivaceum Lawrenceanum, Schm., also each received a Botanical Certificate; and in the grourp were the pretty Zambesian Polyetachya. P. Lawrenceana. which has an aecending apray of whitish flowers with pinll lip; the singular-looking Aefrided Roeblingianum, Pleurothallis Grobyii and P. macroblepharis covered with pretty flowers of amall size; large plants of Masderallia Reichenbachiana, M. Peristeria, and M. $\times$ Stella and some pretty specimens of the dark purple-flowered M Rol'esas and M. calura, the handsome Miltonia vexillaria superba, a fine specimen of Epidendrum (Nanodes) Medusee, a aingular hybrid Oypripedium (Selligeram majus 9 . Sanderianum ${ }^{\circ}$ ), which will develop into a distinct novelty, and a pretty bright yellow Oncidium, and curions emall-flowered Maxillaria, both unknown.
No lesm interesting were sjme plants sent by the Hon. W AlTER Roteschiln, from his collection of rare botanical Orchids in Lord Rothechild's ardens at Tring Parls, Tring (RT., Mr. E. Hill). Of these, the singular Polycyenis mus cifera. Which bore three stout rpikes, one of which had
numerous large insect-like blooms fully expanded. The curious flowers were of pale-yellow colour, with red-brown spots: the arehed column very slender, and the lip furnished with hairs (Botanical Certificate). Another pretty species Was Zygopetalum stapelioides (known formerly as Maxillaris crimeon colour, and a purpla lip of a velvety texture (Botanical Certificate); and Oncidium olivaceum Lawrenceanum Lehm, also received a Botanical Certificato.
Mesore. F. SANDER © Co., St. Albans, were awarded a Silvel Banksian Medal for a five group of Orehids, in which plants of Cattleya Rex, C. Gankelliana, the C-G. variety virgmalis, and the handsome C.-G. Madouriana: C. Etdorado Wallisif, and other fine Cattleyas made a great dieplay. Amone them appeared Cattleya $\times$ Miss Mensures (Luddemanniana $\times$ velutina), a remarkable hybrid, with yellowish-salmon flowers veined with roee, and a lip in which the side lobes form, as it were, a narrow tabe over the columv, and the front lobe is broadly expanded. The lip is of a red-brows tint at the base, yellow-tinted beneath the column. and the front lobe in lilac with purple veins. Adother still more handsome hybrid 9 Leelio-Cattleya D. S. Brown (C. Trisnæi $\times$ LerlioCattleya Schilleriana), which in richnees of its purplieh crimson colour, bore a resemblance to L. - C. Arnoldiana,
but the flowers were rather fmaller than in that varipty Some of the pseudo-bulbe bare a striking resemblance to thope of L.-C. Schilleriana, and possesaed two leavas (Award of Merit). Also, for the first time. Mesrrs. SAnDwR showed the new Bornean Dendrobiom speciosisoimum, white. with rose bace and orange central lise to the lip (Botanical Certificate); Lycaste Dyeriana, a singular Peruvian species, with the habit of Cattleya citrina, but with angular peeudo. bulbs and drooping green flowers (Botanical Certificate); Dendrobium bracteosum, with bunches of dull roes flowers (Botanical Certifl cate); and D. b. album; the handsome Leelio-Cattleya Schilleriana Schrodero: Leelia Amanda, Dendrobium Phalænopsis Schroderianum. Aganisia ionoptera, the singularlooking Catasetum Christyanum; a pretty series of varieties of Miltonia vexillaria, Cirropetalum picturatum. Cattleya Brymeriana, Cypripedium $\times$ nobilius, $\mathbf{C} . \times$ Cabuzac, Odontoglowsum Harryanum, \&c.
Sir Frederick Wigan, Clare Lawn, East Sheen (rf., Mr. W. H. Young), showed Miltonia vexillaria Constance Wigan, very large and beautiful variety with blueh-white sepale and petals, and broad pure white labellum (A ward of Merit).
Mesars, Jas, Vertcr \& Son, Royal Exotic Nursery. King's Road, Chelsea, showed their singular hybrid Dendrobium porphyrogastrum (ouperbum Euttonii o, Dalhousieanum ${ }^{\circ}$ ), whose flowers were in size equal to D. $\times$ Ainsworthii, but of pale piak hue, the flat, shovel-ghaped labellum bearing a few dull rose lines at the bave; also Cypripedium $\times$ Dominianum albicans (caricinum $\%$, caudatum Wallisii ot), which differed from the original in its larger, more ivory-white flowers fromked with green.
R. I. Messures, Eaq., Cambridge Lodge, Camberwell (gr. Mr. H. J. Chapman), showed fine forms of Vanda tricolor (A ward of Merit), and $\mathbf{V}$. $\mathbf{t}$. suavis; Manderallia coriacea (Botanical Certificate), Miltonia vexillaris albescens, Vanda Parishii varieties of Cattleya Mendeli, and C. Gaskelliana, O. Eidorado
Wallisii, Odontogloserm Harryanum, Aërides multiflomm Lobbil, and Pleurothallis longissima ( $V$ ote of Thanks).
Geo. Maremall, Feq.o Olaremont House, Great Grimsby (gr., Mr. Jam. Johnmon), whe awarded a Silver Bankeian Meowl for a neat and woll-arranged group in which excellently wellgrown and profuse flowered varieties of Cattleya Warceewiczii (gigas), which exhibited remarkable variation, were the prinoipal features. With them wore other Cattleyas; a grand specimen of Epidendruca vite'lioum majus; various Odontoglosanms, Peristeria sapersa, \&c.
DE B. Crawsiat, Rsq., Rosefield, Sevenoak (gra, Mr. Cooke), showed the noble whito Odontoglosesum erispum, Mrs. De B. Orawhhay, and a grand plant of Brassia varrucoem (Award of Merit).
Mesare. Hictir Low \& Co, staged a pretty group of Oschids, in which were Grammatophyllum Fenzlianum, many varieties of Miltonis Roezlif, some fine Oncidium rariconne and O. macranthum, the pretty Dendrobinm Lowii. some excellent plants of Oncidium Lancesnum, the lips ranging in colous from gearly white to dark rove; Oattleya Baperba, C. Fldorado
Walliaii, Cypripediume Curtioii, O. superbieni, ec. (Bronze Walliaii, Cypriped
Banksian Medal).
Mesars. W. L. Lewts \& Co. btaged a group of Orchide in
which a pan of the handsome Madagascan terrentrial Oyporchis grandiffora, illuatrated in the Gardererai Chronicle February 18, 1893. p. 197, was an intereeting feature, and all the more welcome that Messre. Lewis prove it amenable to culture. Aleo in the group were the ningular habonaria Cinnabarina. Rria Clarkei, with curious small areenioh-white flowers (Rotanioal Certificate): Leelia tepebrom bells, a dip-
tinct and handeome form of the L. t . Walton Grange var. tinct and handsome form of the L. t . Walton Grange var.
clang, with vellowish sepals and petals, and bluah-white and dayk purple lip, a curious festure in which was its elongated acuminate front lobe: a singular tiny orange-fowered Vanda, previously named V. Lewisii; Bifrenaria vitellina, Cypridodium leucorshodum, and other Cypripediums, Oncidiam Schlimii, Odontoglossum hastilabium, and varions Cattleyes, I eelias, \&c. (Vote of Tbanks). Malcolm S. Coozr, Eeq.o Kingston Hill (gr., Mr. Buckell), showed forms of Cattleya Warscewiczii, so.
F. A. Brown, Req., Lawn Bank, Teddington (gr, Mp. Slatter), showed Schomburgkia tibicinis; Waltrk C. Clark. Req., Sefton Park, Liverpool, nent Oattleys Wamewiczii : J.
GUrvey Fowler. Baq.o South Woodiord, and R. Forster Alcocr. Esq.. Berthamsted, sent forms of Lelia tenebrose: and Armold WITT, Req.e Maida Vale, showed Sarcanthus filiformis.

## Fruit Committee.

Present: Dr. Robt. Hogg (chairman), and Menars. A. H. Pearmon, W. Pope, Alex Dean, W. Batea, T. Gien, Geo. Reynold, Geo. Wythes, F. Q. Lane, J. Smith, J. Hadson, and R. Fife.

An excellent collection of frait was exhibited by Mesars. number of varieties of Cherries, some thirty in all. The following were noticeable as being very good in colour or in size: Bigarreau Cleveland, B. Napoleon, B. de Schreken, Black Hawk, Black Tartarian, Black Eaglo, Empress Eugénie, Frogmore, Early Bigarreau. Governor Wood, Mey Duke, and Reine Hortense. Raspberries Yellow Antwerp and Superlative were shown in very well-fruited sprays, and sprays of different varieties of Currants were remarkable for the heary orops they bore. In a collection of Gooseberries, the following wers remarked: Golden Drop, Green Overall. Bright Venus, Early Red Hairy, Hedgehog. Forester, and Early Sulphur, \&c. (Silver-gilt Knightian Medal). Messrs. Vertce also exhibitod a fine collection of Peas (Silvor Banksian Medsl).
Mr. W. E. BECKETT, Aldenham House Gardens, Elstree, had a collection of vegetables remarkable for their quality. We noticed Cauliflowers Walcheren and Veitch's Early Forcing: Tomatos, Polegate and Sutton's Perfection: Peas, Duke of Albany, Carter's Telegrapb, and Prodigy: Carrote, Early Cem and Sutton's New Intermediato: Cucumbers, Up-to-Date and Victory; French Beans, Canadian Wonder and Ne Plus Ultra; Potatos, Puritan, Rarly Regent, add Sharpe's Victor: Broad Bean, Carter's Leviathan; Marrow, Mooro's Cream, a pretty little Marrow called Pen-y-Byd, \&c. (Silvergilc Knightian Medal).
Mrs. Whafreld, Ampthill House, Ampthill, Beds (gr.o Mr. Empron), exhrbited a collection of fruits and vegelablee. Fruits included Waterloo Strawberries, Superlative Raep berries, Brown Turkey Figs, Golden Drop Gooseberries, Foster's Soedling and Black Hamburgh Grapes (Silver Bankninn

## Medal).

From Mr. Hecier, Jersey, was exhibited a red Grape Currant, named Comet, shown with very largo berries, nad bearing about twenty in a bunch; and a white Grape Carrant, named Eclipeo: also Graville Griant Gooseberries.
The Mesars. Rotisohild, Gunnersbary Houve, Acton, W. (gr., Mr. Jan. Hudson), showed remarkable Black Tartarian Cherries from a west wall. The trees were planted in 1850 , subeoil gravelly; also. Cherries Bigarreau Napoleon from a subeoil gravelly; also. Couth wall, trees planted in 1850 , A note which nccompanied the fruit said that some years since the trees commenced gumming, and showed signs of dyiug, but this had been quite ming, and showed signs of dyiug, but this had been quite Medal).
There were numerous Melons shown for Certificates, but Awards were given to two only, both of which were ahown by Mr. S. Mortimer, Rowledge Nursery, Farnham. Six fraite of each variety were shown. Epicure is a medium-sized fruit, yellow, with close white netting, and green flesh; and Nugget is rather smaller, straw-coloured, with coarse, netting, and rose coloured feen.
Several Melons were shown from Mr. A. J. Simpson, gr, at the Horticultural College at Swanley, Kent, including Hee Majesty, Gilbert's Golden Queen, Emprets, \&c. Also Peachen Noblesse and Royal George. Other Melons exhibited were from Mr. A. Guy, Hertingfordbury Part Gardens, Hertford: Earl Percy, Syon House, Brontford (gro. Mr. G. Wy then); Mr. WM, SmyThe, Basing Park Gardens, Altom: J. R. PLatT, Enq.en Bruntwood, Cheadle, Cheshire (gr., Mr. Richardson); and from the Marquis of BUTE, Cardift Cantle (gr., Mr. A. Petti grew) The three Melons grown by Mr. Pettigrew were ex ceptionally large yellow fruito. The name did not transpire, but they were generally considered too large.
G. A. Farimi. Esq., Dartmouth Lodge, Forest Kilu, exhibited a basketful of black Raspberries. The fruits were amall, and the parentuge or orgin was not apparent.
Wilberforce Bryant. Esq, Stoke Park, slough (gr., Mr. David Kemp), exhibit
Humboldt and Pine-apple.
Mr. Ward, gr. to the Earl of Rapyon, Longtord Caetie, Salisbury, exhibited a Poa named Longpod Queen; the pode were long, and well filled with good-sized Peas, about ten in each. Mr. A. Guy had brat and pode of Emen, MoMullons GILbERT, Burghley Gardens, showed some pretty little Cauli-
flowers, named Burghley Pot; and Mr. WinhuM Cabmictael eahibitod some seedling Strawberiies. A oollection of vegetablen. including Peas, Beans, Lettuces, and Cabbages, wan exhibited by
Garden, W.C.

## Lecture by Mr. Francis Darwin.

The lecture by Mr. Darwin was on "The Effect of Darkness on the Form of Plants," and in commencing the abject Mr. Darwin said that before the phenomena of etiolation or blanching could be satisfactorily and concluaively explained more fact were required, and these facts were auch as could be furnished by horticalturista. This was one reason that suggested the subject of the present lecture, that those engaged in horticulture might be indaced to take an interent in the queation and commanicate th results of their experiments to the acientific world.
Mr, Danwir then proceeded to ays, that if a plant was subfrected to continual darknesa, the most striking effect produced was one of colour, the stems becomes white and the leaven yollow, but it was more particularly to the difference in shape plant sanmee ander sach conditions that he wished to apeak on the present occarion, with a view to explaining that the monormal, wrowth which takes place is not a pathological condition, but rather the result of adaplation to exvironment or ofrcumstances. It epotato or seedling Bean be hept in darknese, an olongated etem will be produced, and but minute lenves formed. In the case of cereals, the leaves were elongated, not dwarfed. Light in eneential to the nutrition of plants. So true was this that Stephen Hales and others in bia day thought that light was a material food for plants, whereas it is now recognised as a necessity to assimilation only. In the abeance of light the plant can abstract no carbon from the atmosphere. It had been held that etiolation was a purely pathologioal state in the plant, but this Nuw is probably dead, except that Sachs still holds it. From such a view. Mr. Darwie wished to express his dissent, and to put forth a different one altogether. Mr. Darwin had worled tothis quection a $\quad$ good deal, and when about to publish the at kis quection a good dea, and when about to pubish the reault of his research, he found that
The view of the phenomena which the lecturer favoured was, that it was merely adaptation, or response to a stimulus to overcome, or get the better of an sccidental environment. The diffaremce of the two theories was explained thus, rickets in a scrotulous ohild is produced by injudicions leeding [and hereditary endowment]. but the symptoms do not in the least suat the ohild to eccape from its malady, the coadition is parely a pathological one. On the other hand, a Potato set, if deprived of light, will continue to grow 18 if it were under the soil, the energies of the whole plant will be thrown iato producing a long stem, and this to the neglect of the leavee. A seedling Bean would do the same thing, viz., continue to grow as if it were seeking light through theronl, and not until the light-which in this caseisthe "signal of lllumination" to the plant-is obtained will the growth be altered. The plant is deceived in the absence of this signal. The Scarlot Runner grows with a booked plumule while under the surface, but on entry into an illuminated area, the point is moon straightened, but if light be withheld when the shoot is through the soil, the point remains hooked. The nignal of light is necemary to remove this condition, which in itself, is an adaptation to circumstances, the hooked plamale being better able to pierce the soil without injury, than if it were struight. Mr. Darwin then spoke of the gensitivenese existing in the petals of the Grocus to chauges of temperatare, 50 mach 10 , that if the temaperature fell $1^{\circ}$ Centigrade, a movemeat in the petals my bs observed. By this means the pollen wian protected artions the effect of rain. A species of fangus called Copriacos, normally developed stalk and a cap of con siderable sise, but it it be subjected to dariness, the plant will throw all its energies into maling a long stalk at the expense of throw all its energies into maring a long atall at the expense of
the cap. which will be very amall. The stally in this caseis much the cap. Which will be very amall. The stall is this caseis much
lengthened in order to reach the daylight, where the opores lengthened in order to reach the daylight, where the apores
may be disueminated. The gemme or buds of hiverworte may be digominated. The geramse or buds of Liverworts
germinate only is the light; the gemme remain inactive ferminate only in the light; the gommase remain inactive that caused these genmae to remain inactive for a short time, during which the temporary darkueas may be removed whereas did they germinate, they would do so, with the result that they would die.
In whand to flowering plante, il a Narcisuns be deprived of light, the long seape it produces is another eflort to get out of light, the long seape it produces is snother eflort to get out
of the darkness, where along the pollen it carries can be made of the darkness, where alone the pollen it carries can be made
useful. If a plant has oniy radical leaves, the only chance is useful. It a plant has oniy radical leaves, the only chance is to extend theee, the distribation of growth is altered in every
reapect, and in all plants. Mr. Darwin, referring to Sachs classic paper of 1863 , in which he refers to the Hop or Sweet Potato as cases of netural etiolation, said that from Sachs standpoint this was not a happy word; but viewing all ctiolation as adaptation, then these cases were clearly natural. A climbing plant, in order to eacape from the earth line into the air, throws most of its onergy ints producing a long stem, and ubually malres a swall swount of other material only which is exactly what occurs in all cases of otiolation. Ficts ware the food of all hypothesis, and for theo he hoped he might look to horticuiture.

## WIMBLEDON $A N D$ DISTRICT FOETHCULTURAL

Jucx 3 - The twenty-third annal exbibition was
held os the sbowe date, in the grounde of Drammont,

Wimbledon Hill, kindly lent for the occasion by the President of the Society, T. E. Crocker, Esq. The entries were more numerous than in previous year.

## divisior I-Open to all Comers.

For a group of miscellaneous foliage and llowering plants, a vory creditable arrangement gained
Luff, gr. to J. F. Schwanv, Esq., J. P
In the class for four stove and greenhoase plants, in or out of flower, the leading prizes were secured by Mr. G. Hutton, gro to - Prere, Keq., and M. A. Methven, gro to W. Kerler, $\mathrm{gr}_{\text {l }}$ K., Ferawood. Whilst for aix foliage or flowering plants, Ks .., Ferawood. Whist Hutton, and Luff.
There was a keen competition in the class for four exotic Ferns, distinct, the prize-takers being Mr. J. Bentley, gr. to Capt. Boswortif

## Hutton

In the class for four Fuchsias, distinct, open to all members, oreditably flowered examples were staged by Messrs, Mills and Law, who took the prizes in the order named. Zonal Pelargoxiums gave an effective bit of colouring to the show.
For twelve plants in pots not exceeding 6 inches in diameter, Messers. Law, Bentiey, and Chandler were the leading Mesars. La
Whilloblo
Well-bloomed Cloxinias were stagea by Messrs. Mills, Hutton, and Bentley.
Six well-flowered examples of Begonias were shown by Mr A. Slegge, gro to Mrs. DAUY, Copse Hill. Mr. Skegge again secured the premier position for four excellent Caladiums. Well-coloured Coleases were exhibited by Mr. C. Bentley.
The class for twelve plants, suitable for table decoration, was a good one, the prizes going to Mr. Mclregor, Mr. H. Alderman, gro to - Hatrield, Esq., Mordea Hall; and Mr. J. Bentley.

The successful exhibitors in the classes devoted to specimen The successful exhicitors were Messrs. Mew, Thornton, foliage and flowering plants were Messis.
The best twelve cut blooms of Roses were contributed by Mr. J. Bentley,
Well-finished examples of black Grapes (three bunches) were -hown by Mesars. Bentiey and Methven. Mr. A. Methven was lst for three bunches of white Grapes. In the class for six Peaches, well-coloured fruits were saged by Messrs. Luff, Alderman, and Bentiey, the last-named exhibitor socuring the first position for six good fruits of Nectarines.
For thirty-six fruits of Strawberries, the leading exhibitors were Messra. Alderman, Hatton, and Methven. Mr. Alderman aggin had lst honours for four distinct hinds of fruit, followed by Messrs. Bentley and Luff.
A collection of vegetablee, in six kinds, was excellent from Mr. Tharnton.
In Division 2, fos "single-handed" gardeners residing within the district, a group of miscellaneous foliage and flowering plants was creditably exhibited by Mr. T. Chandler.
In the division for amateurs not employing a gardener regularly, the lst prize for six miscellaneous plants was taken by Mr. J. Browr, Norman Road, Wimbledon.
The coltagers of the district made a very good display of vegetables, flowers, and fruit.
Messrs. Thomson \& Son, The Nurseries, Wimbledon, sent a beautifal collection of hardy flowers.

## THE PEOPLE'S PALACE HORTI- <br> CULTURAL.

JULI 4, 5, AND 6.-The third anmmer show took place in the Queen's Hall of the People's Palace, on the above dater, and, both in extent and quality, wan a conaiderable advance on the two previously held.
Not only was the spacious hall quite filled with exhibits, but the large winter-garden also. How heartily the East End Londoners have entered into the spirit of the thing was thown by the large number of groups of plants entered for a 38 feet, and also an 18 feet ground space, and also for 18 feet and 9 feot table-spaces; while collections of six and three plants, as well as many single specimens, were numerou; and there were Fera-cases, model gardens, fruit, cut flowers and vegetables also. In the small greeuhouses, mainly of homely constraction, put up at the backs of their residencea by the Fast End gardeners, capital specimens of Plumbago ospensis, India-rubber plants, green Dracrenas, bhow and zonal Pelargoninms, Begonias (foliage and flowering), Gloxinias, Succulents, Lilies, and many other things are grown remarkabiy well, and they speal volunnes for the care and attention given to them, not a few of the East End gardeners being engiged in the City all day. The favourite window-plants are Fuchsias, trained to woolen-trellises, very larke, finelygrown, and flowered; Pelargoniums, Creeping Jennies, Asp:distra, Aralia Sieboldi, sc. In some of their bacis gardena can be seen planted out aubjects that astonish one that they can be found to grown and blown there. The favourits hardy annual of the Rant Rader appears to be Virginian Stock.
Prizes are offered for the beat kept gardens, and also for window-bozes, and it was necessiry for the jadges to spend the best part of two days in visitiog them, as they laid bitween Aldgate, Limehouse, the Rast Iedia Docks, Stratiord, Hacknep, and Homerton. It is not too much to say some of the best kept gardens were forad in the most unlikely places, and in order to equalize the competition, the gardens visited are divided into two sections: those in open and somewhat airy localities, and those in which they are more crowdet, and the conditions of culture less favourable. It is to with the window. Doxes.

Certain honorary collections of plants, \&c., greatly helped the effect. From the Erogmore Gardens, Mr. ThoMas sent very fine and imposing table of plants; from His Grave The
DUKe or Fire, arranged by Mr. Osborn, the gardener at Duke or Fife, arranged by Mr. Osborn, the gardener at F. A. BeVan, Esq.. Trent Park, Barnet (gr, Mr. W. H. Leas); F. A. BeVan, Euq. Trent Park, Barnet (gr, Mr. W. H. Leea); W. PAUL \& Sovs, Waltham Cross (mainly Roses) ; also from Mr. Holmes, Frampton Park Nursery, Hackney, a fine groap on the floor; and some charming table decorations from M. J. R. Ceard. Round the sides of the hall was a very handsome group of plants from S. B. Bouliron, Esq., Copped Hall (gr., Mr. W. M. Wright); from the DUKE OF Norfolk, and others; and so some very fine features were secured.
Late in the afternoon, their R.H. The Duke and Duchew of York visited the show, accompanied by the Duke of Fife the President, when an address was presented to Their Royal Highnasses, and the Dukr of York declared the exhibition opea. The members of the commi ttee were then individually presented to Their Royal Highnesses, and they made a tour ch the show, being much interested in what they saw. There every reason to believe the exhibition proved a financial success.

## CHERTSEX, WALTON, AND

 WEYBRIDGE.Jorr 6.-The thirtieth annual summer exhibition was held this year in the grounde attached to Out lands Lodge. Stove and greenhouse plants formed a leading festare of the exhibition, and they were generally well grown.
For a group of 14 bs 7 feet, five competed, and Mr. Bidge gr. to C. SWINFEN EADY, Ekq., Oatlands Lodge, was an ewg
winner. The 3nd place being taken by Mr. G. J. Cook, gr, to winner. The 2nd place being taken by Mr. G. J. Cook, gr, to Mr. F. Hopkins, gr. to Mrs. Wodderspoon, The Chestnutas, Walton-on-Thames, was lit for a smaller group, with capital arrangement; and 2nd, Mr. W. C. Pagram, gr, to d $^{\text {. }}$ Courtney, Esq., The Whim, Weybridge.
For six flowering plante, Mr. Jacques was the most me cessful. Fine foliage epecimens were best represented by Mr. Osman in sir varieties, Mr. Gardener winning a similat position for four. Exotic Ferns are usually seen in exceliaat condition here, this year proving no exception.
Caladiums, Achimenes, tuberous Begonias, Gloxinias, and Pelargoniams are well shown. the principal prizes being awarcaed to Mesars. PROTHERO, JACQUES, STEDMAN, and OSMAF, For siz table plants, lst, Mr. Hopkins, with bright-colound examples of middle size.
Cut flowers made an effective display: especially Rooe stove and greenhouse flowers wicens flowers by Mr by Maskn. Mole House, Horsham, in twelve varieties.
Frult was contributed in quantity, Mr. Osman had the beat Coilection of six kinds ; the best two banches of Black Grapes, and dish of Cierries. Mr. GARDENER was ist in the class lot water. Mr. J. Buxton, gr. to J. A. Foster, Eeq.e. Fernlanda Chertsey, took list prize for one dish of Waterfoo strawberried Mr. J. OSMAN was, as usual, invincible in the principsl egetable class, that for eight kinds, and he showed eztremely well.
Messrs. B ARr \& SON, sent from their Long Ditton gronadis inchading many choice suojects.

## IPSWICH AND WOLVERHAMPTON HORTICULTURAI EXHIBITIONS.

We bave received reporth of thene important horticultural exhibitions juat as we are going to press, we must, therefore, postpone their publicatios till our next issae.

## Nurbery Notes

Carnations at the ruyal exotic NURSERY, CHELSEA.
Stannuors efforts have been made to overcome the difficulties created by a great demand for platio and by the anusaal heat of the season, and to furnill a creditable diaplay of ample beda of Picotees and Carnatione at this nursery. The results as regard the whole display relect mach credit on thone re sponsible for this department, and we found os Wedneaday a pretty ahow if not a "blaze of colours. The plants are dwarfer than in most years we ie member to have seen thew, and the "grans" is in the older varieties rather aparse, but fairly abundald in the newer ones, and especially is this remarked it those of Mr. Martin Smith's raising.
Wo will take these first, as they overtop all the others in height, and beat them generally in with floriferousness, and freedom from burst calycen.
Cardina! Wolsey, a yellow ground flower of the Vietory type, bat aperior in colour and form; Dakt of Orleans, aino yellow, but differing fom the fitw named: the flowers large and form excellent-it in
a vigorone grower. Hayes' Searlet is a splendid self of vigoroas habit; thas far the finent self of acarlet colour raised. King Arthar is likemise scarlet with a crimson tinge in it, the flower is large and the form very good; the grass is vigoroas and broad, and habit good. Mephisto it a crimzon self, resembling the old Clove, bat deeper in the tint; the form of the flower leaves nothing to be desired. Mise Andrey Campbell is a vigorous yellow self, large and diatinct. Mias Ellen Terry is one of the best of the white Carnations.

Of other raisers' varieties we remarked Cantab (Gifford), a very free border variety, with the fragrance of the old Clove: Germania, in large numbert : thin in atill one of the finest Carnations of its colour-yellow; Caro Roma, a besatiful parple welf; Martin Cahuzac, a Continental variety-deep velvety crimon flower -moat floriferona, of dwarf habit: a very nice variety; Mru. Gifford, a fine white, very free, either as a pot or border variety; King of Scarletn, King of Crimsons (Douglam, 1892), a neat flower, of fine quality; Alma Newman, of a shade of red, a free bloomer, and strong compact habit, height $2 \frac{1}{2}$ feet; Dachess of Fife, a tender shade of pink, large, pleasing flower; Lady Nios Balfour, pink tinted with chamoise, erect petals, flowern of middle size, and well formed; Dachese of York-a flower in colour resembling Sonvenir de la Malmaison, very fall, and of more than the usual size (Gifford, 1894); Dachean of Portland, one of the bent of the fancies; Rowe Celential ; Joe Willet, a bright dwarf, very hardy acarlet self.

Many of the old favourite varietien were found in quantity, and there are coloure and forms of flower, and habit of growth, to uit everyone taste to be found in this very select collection. The Carnation in essentially a townsman's plant, and in this town nursery it may be seen grown in momething very near perfection. A numerous collection of varietie of Picotees are likewive caltivated, but these pretty flowern always lose by being planted near Carnations, with their more exacting claime on the beholder's attention.

## The Weather.

[The torm "accumulatod temperaturo" indicates the aggre gate amount, well as the daration, of degrees of temperatare above or bolow $42^{\circ}$ Yahr. for the period named: and this combined result is expreceed in Daydegrees - a "OD Day-degree" signifying $1^{\circ}$ continued for an inversely proportional number of hours.

THE PAST WEEK
Tere following summary record of the weather throughout the British Islands for the week eading July B, is furnished from the Meteorological Office :

- The wather was very unsettled and showery daring the early part of the week, with thunderstorms in many places. After the raiddle of the period, however, a gradual improvement took place, and by the end of the week fair dry weather had again become general.

The temperaturs differed very little from the mean, but was slightly above it in the north and east of Scotland, and below it in most of the English districts, as well as in the south of Ireland. The highest reading was observed as a rule on the 6th of July, and ranged from $71^{\circ}$ in 'Scotland, W. and England, N.W. $0^{\prime}$ to $76^{\circ}$ in the 'Midland Counties and Ireland, $\mathrm{N}_{0} 0^{\prime}$ ' and to $77^{\circ}$ in 'Scotland, $\mathbf{E}$, and Eaglend, S.W: The lowest readinga, which occurred mostly on the 5th or6th, werm rather low for the time of year, the thermomator falling to $45^{\circ}$ or lesa, in nearly all districts. and to $40^{\circ}$ or lows in ' Scotland, ${ }_{W}$., England, S.W., and Ireland, $N .{ }^{\circ}$
"The rainfall was less than the mean in the extreme northern and north-western parts of the Kingdom, es well as in the 'Channel Islands,' but in most other districts there was a slight excess.

The bright sunshine varied greatly in amount in different localities. In 'Ireland, Scotland, N., and Eugland, N.E. and S.,' the number of hours recorded was below the average, but in most other districts there was an excess, slight in many cases, but large in 'England, S.W. and the Channel Islands.' The percentage of the possible duration ranged from 16 in 'Scotland, $N_{0}$ ' and 23 in 'Ireland, $N_{0}$ ' to 43 in 'Scotlend, W. 54 in 'England, S.W.,' and 67 in the 'Channel Itlands.'

## Market 8

## COVENT GARDEN, July 11.

[W0 cannot accept any responsibility for the subjoined reporta. They are farnished to us regularly every Thursday, by the cindness of several of the principal aaleemen, who revise the list, and who are responsible for the quotationt. It must be rememberod that these quotations do not represent the prices on any particular day, but only the general averages for the weer preceding quality of the samples, the supply in the marlet, and the quality of and they may fluctuato, not only from day to day, but often several times in one dav. KD. 1
Out Flowers.-Average Wholrsale Prictes.

## FRUITS AND VEGETABLES

Borougr: July 9. - Quotations:-Pean, 2s, to 2m.8d per bushel: Horseradish. 18. to 18. 3d. per buvdle: Apples, Tasmanian, bs. to 8s. per case ; Gocseberties, 1s. 6d. to \% \%s. per half-sieve: Strawberries, 1s. 6d. to 2s. per peck: Currante 2s. to 4s.: Cherries, 18. $8 d$. to 2s. $9 d$. per half-sieve.
Spitalfiklds: July 9. - Quotations:-Cherries, 8s. to 3s. $6 d$. per half-sieve; Currants, black, 3s. 6d. to 4s. per halfsiere; Broad Beans, 18. 6d, to 28. per bushel; Peas, 2s.6d. to 3s. per bushel; Cabbages, 4s, to 5s. per tally; Carrots, 2s, to 2s. 6d. per dozen bunches ; Turnips, 2s. to 3s. do.
Stactrond: July 9. -The trade at this market during the past weok has boen brisk, there being plenty of busers, and an abundance of all kinds of produce. Quotations: Oabbages, 18. 6d. to 48. per tally; Caulifowers, 1s. to 2s. per dowen ditto, 4s, to $88.6 d$. por tally: Tarnips, 18 to 1 d .6 d . per dozen bunches: Carrots, 1s. to 1s. 6d. per dozen bunches; Mangolde 10s. to 17 s . 6d. per ton: Oherrien, 3s, to 48 , per halt-aieve Black Curfants, 4s. to 4s. 8d, per half-aleve; red ditto, 28.0 od to 4s. $4 d$. per hall-sieve: Gooseberries, ripe, $2 s$, to 2s. $8 d$. per half-sieve: ditto, green, $3 s$, to $3 \mathrm{~s}, 6 d$. per flat; Strewberries 8. $6 d$, to $2 s, 6 d$. per peck; Raspberries, 3s, to 4s, per dozen punnets: Tomatos, English, 4s, to 78. per dozen pounds: Green Peas, 3e. 9d. to 58. 6d. per bag: Windsor Beans, 38. to 3s. Bd. por bag.
Farmingdox: Ju'u 11.-Quotations:-Cabbage. 1s. 3\%, per dozen; Turaips. 3s. to 4s. per dozea bunches; Carrots. 18. 6e. to 4 s . 6d. do.; Marrows, 3s, per dozen; Spring Onions, 3s. per dozen bunches: Cucumbers, 1s. $3 d^{2}$, to 25.80 . per dozen; Chorries, whiteflesh, 4s. per half-tieve; do., black, 2s. ed. to 38. 6d. do.: Gooseberrien, ripe, 24. 6d, bo 3s. do.; Currants, rod, $2 \mathrm{~s} .6 d_{\text {. to }} 8 \mathrm{~s} .6 d_{\text {, do. }}$; do., bleck, 4s. to 4s. 6d. do.; Pineapples, 24. 6d. to 2s.6d, each.

## CORN.

Averages. - Official statement of the average pricen of British Corn, imperial measure (qr.), for the week ending July 6, and for the corresponding period last yetr $:=1895$ : Wheat, 25s. 7d.; Barley, 10s. $9 d_{0} ;$ Oats, 16s. $4 d_{0}$; 189s: Wheat, 248. 6d. : Barley, 25s. 7do; Onte, 19s. 6d.

## ENQUIRY.

- He that quastioneth much ahall hearn nuwh."-Bдoor. Tomato Fruits not Swelling.-A corrempondent aend the following:-"I should eateem it a great favour if you would kindly tell me the reason why the firat two or three trusees of my Tomatos bear such very mall fruit, no larger than Cherries, and quite ripe. The frait neem: to be nwelling all right enough half-way up the plant, and making fine large fruit. Should I have atopped the leader, nay, when it had got 4 fest higb, to cane the lower transes to awell off, and then let it grow again? My planta are 8 or 9 feet high now. In a later house I have 950 plants in, the bottom truses are swelling off all right, and I never atopped them. My three earlieat houses I planted got a check from some aalt or nomething that had been in the manare anknown to me, and all turned black aoon after they were planted. Would that be the cause? They hava never affered for want of water. Nurseryman.

* Owing to the large increase in oner circulation, we are reluctantly under the necessity of going to press some hours earlier. Our contributors, who well know what this implies, woil cinaly aid uas by sending, wor the Wednesday.
- Plavis, Frutra, ETC., To eis Nabied.-Comrespondento amaing plants or fruits to be named, or asking quadtom a obtuing ass annowor to their enouivias ith the current weet specimens should be good ones, carefully packed and nuwbersd, and not nore than site should be sent at ome time. Lowes only, of Floride varieties cannot, as a rule, be named.
Asparagus tenuisenus: $J, 4, F$ It does not reckon as a "flowering plant" in the ordinary sense of the word, as used by achedale-makers, and we think that your collection would be disqualified if this plant formed a part of it. Among foliage plant this pecies of Asparagus would be admisuible
Boors: A. B. Index Kawensis, Frawde, Amen Corner, London, E.C. Four vols, at 2 guineas each. Foreman. There is no ons book which treats directly of mursery gardening. Ady good garden-
ing Manasl ach ae My Gardener, by Mr. H. W. Ward, Longford Castle Gardens; Hardy Flowers, by W. Robinson (Macmillan \& Co., London); Stove and Greenhouse Plants, by B. S. Williame \& Son, Victoria and Paradise Narseries, Upper Holloway; The Nursery Book, br L. H. Bailey, The Raral Pablishing Co., Now York, or through a foreign bookseller in London. If you intend to grow only certain plants as Carnations, Chryasathemama, Clemativ, Datch Balbs, Tomatos, \&c., manauls on these and others may be obtained at the Bazaar Office, 170 , Strand, W.C.
Carkations: G. F. The plants are apparently affected with eel-worms. Nothing can be done except to turn out the soil and get frenh.
Catebpillars of thi Sawfly on Goobibbrbt: P.B.S. To guard againat the recurrence of this pest, you ahould ahovel away the whole of the soil beneath the bushes as far as the brancher extend at the very least, and to a depth of 4 inches, charring it, or barying it deeply in the soil in ame dietant part of the garden, replacing it with fresh garden aoil, or lonmy soil from outnide the garden. This may be donest any time from the present till the end of January. If it be done in frosty weather, there should be no haste in replacing the woil taken away, as exposure to hard frost in likely to do good by destroying any chance grabs that may have been left behind. A slight dreasing of gaslime at that time might alao be beneficial in the ame way. As you nay, the quasia-water clears the buhes of the caterpillary, but it doen not clear the soil of them.
Corrbction.-For "tuan chikee," p. 799, in vol. xvii. of Gardeners' Chronicle, read "taisan chikn."

Holliss: W. C. The leaves are attacked by a naw-fly. Encourage the birds. We do not think any permanent injury will ensue.
Lawk Dressing: $M . B$. Lawrence. At this aeason a mild kind of liquid manure may be used. In the antamn and winter a dreasing of aifted clayey loam, with wood-azhes and aifted charred garden refuse, charcoal-duat ahould be applied regularly all over the surface, laying it on so that the tips of the grase can be jast seen throagh it. The woodasher may be uaed in the proportion of one-tenth of the whole. Well-rotted farmyard or table dung does good, but the effect. are less lasting.

Pteris longifolia; 2, Adiantum hispidalam; 3. Cyrtomiam falcatam; 4, A plenium bulbiferam; 5 , Pteris cretica albolineata; 6, Aspleninm trichomanes. - Germany (noletter). Dendrobium grationisnimum; the other probably Phlox maculats var, candida. -S. $H$. W. The large Cattleys is C. Waracewiczii, commonly called C. gigas in cardens; the others, C. Mendeli and C. Monsise; No. 4 in also a good C. Mendeli ; No. 5, Odontoglonamm pulchellum, not Oncidium. The photograph duly came to hand. Many thank.
Narciesus: J. H. T. The bulbe were subjected to bad treatment after they had flowered in January, 1893, the frost doubtlem destroying the tender learem grown in heat. They were weakened thereby, and failed to give atrong offiets. The early forced bulbe thould not be placed out-of-doore, and receive "nol attention" till they are again planted. It is better practice to keep them in cold frames.
protecting them from frost, affording them water in moderation till the leaves mature, when they may be dried off, and the bulbs shaken out of the soil, and fully exposed for a week or two to the sun. A period of from one to two yeare should elapse before Narcissus are forced a second time. Your noil appears to be of a most unpromising nature, needing mach amelioration by mixing it with garden refuse, burned earth, fine coal-anhes, strawy table-dang, and, \&c. Cow-manure, either decayed or not, is of small value in such land, and to place it at the base of the balbe in that or any other soil is a dangerous practice with Narcissus, which are plants that are injured by contact with manures. You would find decayed vegetable substances, leaf-soil, \&c., mach more suitable. Qaick-lime would do your clayey loam some amount of good by its mechanical action if dug in before allowing it to slake. We do not think that the drought of 1893 caused any injury to the bulbs, the land being of too retentive a nature to be affected by it; or that the late severe winter was injurious. As you sappose, soot makes a good sort of topdressing, containing, as it does, considerable quantities of ulphate of ammonia.
Narcissus, \&c. : T. Bros, and W. W. The balbe are affected both with mites and fungus, but the bulbs look so healthy that they may outgrow it with las manure.
Pinks: S. B. Your seedling, white Pink is a little larger than "Her Majenty," and the habit you deacribe is an improvement.
Sifage Distribution: D. W. C. McI. a broad feeding-canal hould be made with puddled aides and bottom at the higher part of the field, to hold sufficient sewage to irrigate a large portion of the lend. This whould be made with a slight fallasy, half an inch in $: 0$ feet. From this canal other amaller canals should proceed, at 12 to 15 feet apart at right angles, each being fitted with a sluice or penstock of an ordinary description in wood. It would be better to divide the field transversely with one or more feeding-canala, and make the intervening land quite level and true; then by allowing the sewage to ran into the minor channels from the main feeder until it reached the top or the sides of these, or half an inch above them, the sewage would apread over the anface gradually and without any rush. By this syatem of ahallow draina any part of the land could be asturated at will; and when sufficient moisture had been afforded, the aupply must be cut off by cloning the sluices. If the land is level, or nearly so, it will not be a difficult matter to irrigate it in the manner deacribed. Very irregular or hilly land, which would coat heavily to level it and layout drains, could be irrigated by means of a col-lecting-tank and an undergroand syatem of iron pipes, the sewage being distributed from standpipea by means of a hose or a water-barrow.
Tomstos: Treseder and $W$.W. Your fruits are attacked by a fungus known an "black apot." Remove each fruit as soon as the disease is noticed. Save seed only from healthy plants.-T. G. Your plata are affected with funga. Burn all the affected plantn at once, and apray the leaves with weak Bordeaux Mixture, taking care not to use it on any of the berries that are near the ripening stage.
Tomatos not Swelema: Nurseryman. Will you kindly aend up asmples of fruit from one plant that exhibite the undesirable peculisrity that you mention. We print your letter in another column, in the hope of eliciting the opinions of our readers.
Tomatos Splitting: W. J. Excensive watering probably following on a period of drought. The same thing occurs in atone froit, Melons, \&c. We do not know anything of the peculiarity of Chemin Rouge.
Trufples: G. E. E. There is a book in the French language by M. Chatin, which treats of the culture of Traffles. We would, however, advie Jou to make eaquiries of the secretary of the Socié!́ d'Horticulture de France, Rue de Grenelle 84, Paris, who would be pleased to afford you information on the aubject.

## A PRIMITIVE TOBACCO FACRORY

CHINA is nothing unless she is primitive, and although the faotory which forms the subject of these remarks is not exactly situated in Chinese territory, as it is in the Portuguese settlement of Macao, it is, to all intents and parposes, a Chinese factory, for it is owned and worked by Chinese. The premises oomprise several large sheds with earthen floors, and one or two better built rooms, nsed as storehouses. The factory gives employment to several hundred Chinese men and women. I was accompanied on my visit by Mr. A. A. Pettigrew, a son of Mr. Pettigrew, of Cardiff (Csstle, who is at present (May) on a tour in the East. The tobacco is not grown at Macao, but at a plase called Hokshan, about forty or fifty mile to the north-west of the former town, on one of the numerous mouths of the Sikiang, or Canton River. When the plants are properly dry, they are done up into bales ahout $2 \frac{1}{2}$ feet long, 2 feet wide, and 1 foot deep, and sent down to Macso in jouls. On arrival at Maoso, these bales are stored in the premises of the factory antil such time as they aro required for the manafacture of tobacco.

The first room we entered was devoted to stripping the leaves from the stalks, thene being disoarded in the manufacture. Women, sitting on the floor on their haunches, were busily engaged in this operation when we entered. The sight of us did not distract the women's attention, but several young ohildren who were present on our arrival, sompered away to distant corner like mice into a hole. The dust from the tobacon leaves got into our noses and throats, and caused us to sneeze and oough, much to the delight of our celestial onlookers, as evidenced by the lond outburst of laughter whi h followed our dinoomfiture. Strange to say, we did not hear a sneeze or a cough from any of the Chinese whilst we were in the factory. After the leaves have been stripped from the stalks, they are carried into one of the sheds in large bamboo baskets by men, then spread on a wooden floor and damped with water. When sufficiently damp, they are made up into layers about $2 \frac{1}{2}$ feet long, 2 feet wide, and $2 \frac{1}{4}$ inches thick, and placed on boards. The next process is to make eanh layer into a solid calre. This is done in the following way: - About a dozen layers, with a board $1 \frac{1}{2}$ inch thiok between each layer, are placed on the top of one another, and then pressure is brought to bear upon the whole lot by means of a lever of the second order, in the shape of a thick pole. One end of the lever is fized firmly with strong ropes, and this constitutes the fulcram; the weight or the resisting substance is the tobacco, and the power is applied at the other end of the lever by means of stout ropes, which pass round wooden axle that is securely fastezed to the ground.

When the tobacoo leaves have been properly pressed，the cakes are taken out and out oross－ wise into strips 4 inches wide，and the two ends cat off，as they are not sufficiently pressed．The next step is to tie half－s－dozen of these strips together by means of ropes．The next opera－ tion is to make the tobacco ready for use．This is done by means of a plane，very similar in shape to an English carpenter＇s plane．The strips of tobacoo are stood up on end on the ground， and kept in position by boards made for the purpose．As the strips are only about $1 \frac{1}{2}$ foot high，the men have to work the plane in a half－stooping position，a most uncomfort－ able way of working from an English－ man＇s point of view．However，the Chinese do not appear to mind it，as they work away contentedly from morning to night．The shavings of the tobacoo leaves are the tobsco ready for smoking．Every man puts his shavings，as he takes them from the plane，into small heaps，weighing about a pound eaoh， enolosing at the same time a tioket with the name of the firm on it in the centre of each heap．These small heaps are then put into papers，the two ends of the papers being left open．The packets are then weighed，and a little more tobacco is added or taken away according to whether the packet is too light or too heavy．When the packets are of the proper weight they are pat into another paper，both ends closed up，and then packed in bozes resdy to be sent away．There is a good deal of order in the way in which the factory is worked．Women are only employed in stripping off the leaves from the stalks，men do all the rest of the work．There is one lot for damping and pressing the leaves，and another batoh for cutting the pressed oakes into strips and tying them up ready for planing．The planers only make the tobacco and put it into heaps，a separate lot of men put it into the first papers ready for weighing．The men who weigh the tobacoo pass it on to others，who pat it into the second paper，and these finally hand it to the packers． The tobacoo is of a dark brown colour，and is only used，so far as I know，by the Chinese。 It has the repatation amongst them of being a par－ ticularly good brand，and the factory is said to be one of the largest in South China．It was very amasing to see the workers at 12 o＇olock，as this is the time they take their mid－day meal． As soon as the clock struck twelve，everything stopped as if by machinery．In less than five minutes tables were produced from anlooked－for corners，basins of rice and other foods were placed upon them，and the men were basily engaged in emptying them by the aid of ohop－ stioks，All the workmen took this meal in the same place as they had previously been working in，W．J．Tutcher，Botanic Garden，Hong Kong．

## New or Nuteworthy Plants．

## TEE GUADELOUPE CYPRESS＊＊

 ．hacrocarpa var guadrlouprnsis，Maste） Turelate Prof．Streno Waisou deacribed this fine Cyprese as a distinct species，under the name of C．gardeloupensis，and perhapa rightly．It may[^5]also，and，as we think，more correctly，be considered an a form of C．macrocarpa．The latter，known at the Monterey Cypreas，ham a very limfted range of distribation on the Californian coant，and，to our thinking，the present is but an insular variety of the species，differing from the type more especially in its glaucous colour．It is true there is a coniderable distance between Monterey in lat． $36^{\circ} 4^{\prime}$ ，and Guade－ loupe，an island in $29^{\circ}$ N．L．， 200 mile from the mainland，with deep sea all around，but it in pos－ aible that intermediate localitien may be found．At any rate，the presence of distinct charactern in a common feature of plant growing on isolated islands．Our illuatration（fig．9）is from a specimen sent us by Dr．Francenchi，of Lo Angelen，who can also furnith seeds．The illuatration how a por－ tion of a spray with male flowers of the natural aize， foliage and male flowert magnified．The cone are generally larger than here represented．For the sake of comparion we append a figure of Cupresua arizonica（figy． 11 and 12），with a transverse section of the leaves of that species，and also thome of C．macrocarpa（fig．10）．M．T，Masters．

> Fig 9．－the guadeloupe cipress（c．macrocarpa

## Entrrosora Fawcetti，Jenm。n．sp．＊

The only plant of this discovered wat seat to me several yearn ago by Mr．Fawcett to determine．I saw at once that it was a true Enterosora，but it dif－ fered from the Guiana specien in it much maller size，hairiness and very slight sinuation of the margins， Having so little material（a aingle bat fully mature plant），after notiog the diatinctions mentioned，I thought it bent to leave it with E．Campbelli，think ing it would coon be found again．It has not，however， been re－discovered．I therefore publish it，particularly

[^6]as Mr．Fawcett，after careful examination of the specimens of $\mathbf{E}$ ．Campbelli at Kew，writes me that he regards it，because of the characters juit mentioned as a diatinct apecies．The Guiana plant han an elongated root－ntock，which，though morphologically of similar character，is several times larger，quite gla－ broun，glosay，and bright coloured；more or leas freely ainuated，occasionally forked at the top，and mometimen with a furcation，or jib－like extrunion on one or other side．The necie now known are：－E Campbelli，Baker，slopes of Roraima，British Guiana； and E．Fawcetti，Jenm．，Rose Hill，Jamaica．It is remarkable that this genus should have been dis－ covered so late in the day in two well－explored countries，whose flora，fauna，and geology are so different，and which are so wide apart，mach about the same time．Both species resemble in form clowely Polypodium trifurcatum，L．，which alno grow in both countries，for which，without clowe examination，they would at once be mistaken．G． $\mathcal{S}_{\text {．}}$ Jenman，Demerara．

Hembrocalles aurantiaca far．major，Baker．
This botanically comen close to the plant which I deacribed in the Gardeners＇Chronicle，1890，vol．viii．， p．94，from the Royal Gardens，Kew，under the name of Hemerocallis aurantiaca，but it is larger in all its parte，and is the finest Hemerocallis I have aeen．It has the firm，bright orange perianth－segment of the type，and like it，自owern later than flava，Middendorfii， and Dumortieri．The leave are an inch or an inch－ and－a－half broad，firm，and atrongly ribbed．The peri－ anth－tube is three－quarters of an inch，and the limb 4 inches long．The inner segments are 18 to 20 lines broad，and the expanded flower in 5 to 6 inches in diameter．It was imported from Japan by Mesarn． Wallace \＆Son of Colchester，and wat exbibited at the Drill Hall on the 9 th inst．，where it obtained a Certificate．J．G．Baker．（See fig．14，p．71．）

## Orohid Notes and Gleanimgs．

ORCHIDS AT ROUNDHAY MOUNT，LEEDS．
This Orchid－houres in Dr．Jemop＇s pretty garden near the fine Roundhay Park，are well situated，and their occupant have in Mr．Tyson，the gardener at Roundbay Mount，a careful and diligent cultivator Seeing therefore，that Dr．Jemop himelf takes a personal interest in his Orchids，it is not sarprising that the collection affords a good example of anc－ censful cultivation．Odontoglonam，Cattleyas， Lalia，and Dendrobium，are the apecies chiefy found，and in each department，aniform vigour， health，and freedom to flower are remarked． In the Dendrobiam－house，the base of which is in part planted with foliage plants，Palmp，Begonias，\＆c．，the apecimens of Dendrobium Dalhonaieanum have madea grand show，one plant having nearly one hundred flowers．In addition，there were nome beantiful plant of D．tranaparens，covered with their pretty blush－white and purple flowern；D．Pariahii，and several of the 150 or so plants of D．Phalenopais Schroderianum which are here grown，were in flower． Some fige specimen of $D$ ，thyraifloram and othera that class；together with a few Phalænopnin added to the dieplay．

Ia the block of mpan－roofed houses we found fine Cattlegas and Lalias，mong the former beiok a large number of $\mathbb{A}$ ，wern on excellent varieties of Cattleya Monix；among thene C．M．marmorata is a noble form of flower，with very large lip，that is marbled with rone and purple；C．Schroderx is one of the most delicately－tinted and fragrant of Cat tleya；C．intermedia and other apecies were noted． Among the Lelias，$L$ ．cinnabarina wan in flower， a＇so a dark scarlet－coloured form of L．flava－a dis－ tinct and pretty variety．In the namo house afice plant of Miltonia spectabilis radians，and other Mil－ tonian were remarked，a small stage being raised near the glaan for M．Roezlii and M．Phalwnopeis，both of which are in fine condition．
Paming to the group of Lelia purparata，we fonnd a good show of fine and dissimilar flowers－one
having enormous blooms. So beautifal are these forms of $L$. parpurata that they carse one to ank, when we hall get a new Orchid, either species or hybrid, which will be their equal? Another house had apecimens in flower of Cattleya Skinneri, another old favoarite difficalt to excel ; Sobralia macrantha, and the fine yellow S. xantholeuca; Cattleya Aclandix, and a healthy collection of Cypripediuma, among which C. Rothechildianum, C. hirsatissimum, ome plendid C. bellatulum, C. Godefroyæ, C. niveum, C. caudatum, C. Chamberlainum, C. Cartisii, \&c., were in flower.

The next house was occupied chielly with Cattleys Trianæi and other of the C. labiata class, ome good C. Mendelii and C. Schroderæ being in bloom. An Anguloa Clowesii was carrying twelve flowers, a plant of A. Rackerii angainea was very handsome, and specimens of Dendrobiam infundibulam formed pretty objects. Overhead were sprapy of Odontoglossum citrosmum, and some good plants of Dendrobium Hildebrandi, whose soft primrose-yellow flower are alway pleasing; Saccolabinm curvifolium, a pair of Rodriguesia venutta, and some vigoroun examplen of Vanda coerulea.
In the cool house a few fine spikes of Odontoglossum crispum and other Odontoglosmums were noted, also some Masdevallia Harryana and M, ignea, M. aimula, M. bella, M. $\times$ Heathii, and Ada aurantiaca; and in a slightly warmer house a fine display of orange-scarlet flower on several strong specimens of Epidendrum vitellinum majus; Oncidiam concolor saperbum, with flower as large as $O$. aplendidum; a denselyflowered O. cornigerum, with six opikes; Odontoglonam hatilabiam, and other Odontoglonnms, and Oncidiums, and a healthy batch of Miltonia vexillaria. The conservatory was gay with Lilies, Calceolarias, Pelargoniams, \&c.; and in the open garden, herbaceous and alpine plants fill the borders, and furnith the rockeries outdoor.

## Luddemannia Pescatoril

We underatand that the plant exhibited by Sir Trevor Lawrence under this name has nince been determined to be a now apecien, and has been named by Mr. Rolfe-Laddemannia triloba.

## TOMATO FRUITS NOT SWELLING.

Is reply to the inquiry of "Narseryman" regarding the above aubject. vide p. 51 of the last insue of the Gardeners' Chronicle, I may asy that continued observation in the cultivation of Tomaton has led me to the belief that no one cause in particular may be given for the non-swelling of the earlier fruits; but on the other hand that a variety of cause and circamatances combined, conduce to the ame end. I believe one of the most prolific causes to be innafficient atrength in the plant themselven, a circamatance in all probability due to the warm temperature necessary early in the year for the growth of these plants. Very frequently in the early atages the plant are allowed to become crowded, or a warmer cloner temperature than is really needfal or beneficial is afforded, and in either case the early trusses are generally of little uee. But because the trusses are really put forth and the flowers expand, it does not follow that the wood is anfficiently mature to bring about the best resulte. In "Nurseryman's" case it is almo in the "three earliest houses" that the non-wwelling is mot noticeable, a fact which appeara to give weight to my view; while in the "later houses the bottom trusse are swelling off all right." Thus it would appear that the laterraised plants, with preamably lens fire-heat and more aunlight and sunheat, have produced firmer, and therefore more fruitful, wood. Any foreign matter in the manare which would cause the plants to "tarn black" in a few days after being planted would uadoubtedly prove highly detrimental to the plants ; bat apart from thi it is by no means ancommon for the two earliest produced trusses, when very low down, to be puny and amall, while the third may prove of prodigious weight.

Light, again, is a most important factor, and all important so far as setting the frait is concerned. For some eight or nine years past I have planted a row on each side of a wide house to go up the roof, trained near the glans. I have prepared the plants in various way*, sometime planting from 4 -inch and sometimes from ' 8 -inch pots, with the first bunch already set, and nome welling the fruit. But at the side of the house there are 18 inches of brickwork before the wall-plate is reached, so that the firnt-Met bunch will be about 9 inches below the wall-plate, and therefore in obscured light. Whether planted with plants out of large or amall pots, thim bottom truss is invariably a failure, but the first trusi which receiven full light is generally a large one. I have this season many notable instances of this. In the first 2 -feet run of stem three trusses of flower: have appeared, the two first by reason of their position being always shaded, producing only puny worthless fruits; the third in fall light, bearing from a

Fig. 10.-leaf-section of c. macrocarpa. $\times 20$. (SEE p. 82.)

7 inches of atem. The varisty wat Chemin Rouge, a plendid variety, that wet freely, and han fine bunches of fruit of a asefal and uniform size. "Nurseryman's" planta, judging by their height at this early date, could acarcely have carried a good crop. Bat it will certainly not antist matter to stop the plants at 4 feet high, although anch a proceeding would be quite right with a late batch, which may only have time to finish fruit at 4 feet high; but with a full season in view it is another matter. The extreme point of the growth is full of embryo bunches of fower-bade, and to remove the point at 4 feet high would only result in axillary growth, and such growth would attain a considerable length before they become fraitful again.

For some years past I have planted my earlient Tomato plant in January, the first batch rarely doing mach good; they appear to net well, bat eeldom wrell of a useful size, owing to lack of nunlight at this early date. I am satinfied if I get a good buach on the stem at 18 inche from the ground, for if a bunch of rapidly-swolling fruit is got at that height, it tend to check growth usefully later on, Some growers bury a part of a rather tall atem by laying it on its aide in planting, which I think is a mistake, aince the Tomato, being a rampant grower naturally, is rendered more so by furnishing it with a greater number of rootm in it early stagen. A shallow narrow bed of rather poor and firm aoil condaces greatly to a good early set; but the plents must not be neglected in any way, and once a good set is obtained, the plants benefit by liberal wateringe, liquid manure, and a urfacing of fairly rich soil. Tomatos for planting in January should be sown at the end of September, and grown ateadily on in as cool a temperature an is consiatent with healthy growth, a long meanon of teady growth being an important factor in very early fruiting. $J$.

## ROUND GHENT.

In the housen of M. L. De Smet-Davivier we noted recently Antharium M. George Montefiore, raised from A. Rothachildianum $\times$ sanguineam. The opathe is rounded, the form charming, with bloodred spots beautifully shaded. The apper anrface is covered with a clond of dotiv, mixed here and there with pots. The lower surface in much more beantiful and diatinct than the cther, and beara large apote which almost entirely cover the whole surface. This is a very dittinct Anthurium.
A fine specimen of Aralis monatrona, which is becoming very rare, grows in the same house with a hundred pretty plants of Livistonajrotundifolia, whose valuable decorative properties are well displayed. Few thinga are more charming than are these miniature Palms aned for table decoration, baskets, \&cc. A very fine seedling Croton from C. Diaraeli $x$ Hanburyanus aurprised me agreeably; the young leaves are very bright yellow in colour, exceedingly delicate, the end of the leaves and half the length of the border of them are a pretty tone of green; the adult leaves are dark green, verging upon black, with the midrib and other veining yellow, the petioles a fine thade of red. I noted a flowering specimen of Tapeinoter carolina, a fiae old plant which denerves to be more widely grown.
M. L. Ds Smet-Davivier't garden aggented Italy, owing to the large numbera of Bumbuas aurea there growing; thene Bamboo chould certainly take a more important place as plants for parke and gardens ; they are also suited for indoor decoration.
At M. Jou. Boelen's establiwhment I admired a fine apecimen of Mitraria coccinea, unfortunately much neglected now-a-days, and a good example of a variegated Rhododendron, the green centre of the foliage being arrounded by a yellow edge.
M. Ch. Vaylateke hat now some fine Orchide in bloom. I would mention Miltonia vexillaris Empress Augusta Victoria, of fine colouring; Odontoglonsum Harryanum, with large flowers, the lips of which are of considerable size. The upper half is wide, and of an uausually pure white coloar, the purple part of it veined with white, the yellow of the lower section of remarkable brightzeap.

The eeedling Odontoglossum mentioned by me continue to grow well; they require apecial care, and dislike drought as much as they do excessive dampneas. After seeing a fine Cattleya gigas I was ahown a C. Gakelliana nobilis with several flowern of a very delicate tint.
A plant of Cypripediam Chamberlainianum, which I have mentioned as flowering in the beginning of May, 1894, atill bears two fine blooms on the same raceme, and there are buds promising fature flowers. A apecimen of Odontoglossum Lindleyanam deserves notice. It hay twenty flower-stems with about aix blooms on each; these $1: 0$ flowern are very bright in colour. Three fine amples of $O$, mulua covered with flowers; O. mulus Holfordianum leriopteron, an excellent variety with flower of a very clear ground colour ; O. ornatum, 0 . elegantius, with a fine branching apike bearing flowers whove ground colour is greeniah yellow, with a large apot on the nepals, and on each of the petals two small apots and $O$. macrantham with very large flowera, complete my list of the Orchids now in bloom. Ch. De B.

## FLORIST8' FLOWER8.

SOME NOTES ON TAKING THE BUDS OF CHRYSANTHEMUMS.
Doubtlass locality makes a great difference as to the best date for thir operation, and the seasona make a great difference in resulte, so that the best calculations are liable to be upet in some particular. I like to get a good free growth for exhibition flowers, and allow the plants, with very few exceptions, to break naturally. An a rule, I have no tronble with the plent showing their crown-bude too soon; in fact, many of the incurved varietien are often too late, and this in a season like that of this vear.

The best flowern of Queen of England I ever had were taken on Angust 4, 1891; the plants had grown very atrong owing to having being kept indoors longer than uaual during the very cold and late spring, but were not stopped in any way. In 1893 meveral of this class were cut back in May because they persiated in flowering instead of growing; they grew much weaker afterwarde, am might have been expected.
I never find Lord Wolseley and Prince Arthar show too soon; in fact, the difficulty with these two varietien is to get them to show early enough. The bent flower of Lord Woleeley I bave had was from a bud taken August 23, 1892, and I find from my note-book three more buds were taken on August 30, and five on September 12 in that year; the latter, of course, were quite useless for exhibition. Lat year five were taken on Auguat 31, and did well; in 1890 the firat three were taken August 26, and were good flowers.
The Princesm of Wales family, in which I include Mrs. Heale, Violet Tomlin, Mra. Culeman, and Misu Haggar, is very similar to the above in the matter of ahowing buds, \&e.; many of the ahoot during 1893 were not thowing on A aguet 31, and the fiowern that set after that date are of no une for exhibition.
In 1893, I topped Hero of Stoke, and auch varieties early in May, and got a few very fine flowern in good time. I had not tried atopping before, and never got this family up to time previoualy, that I am quite favourable to stopping these in any teaton; the beat flowers I had were taken on Auguat 31, nome taken mach earlier were quite umelem, and I find them quite large enough for the centre row on the atande occarionally.

Lady Hardinge grew atronger and did better in 1893 than ever before, and the eame may be eaid of Alf Lyne (bude taken August 7).

Madame Carrière ahowed bloom at every point in May, and had to be cat back like many of the Qaeen family. I afterwarde got vome fair blooms, but they were much inferior to thoue of the previous year when they were not cut down or topped in any way.

Tha Japanese varieties in ome instances ahow too noon, but au a rale they may be left to make a natural break. This nection ia not earily divided into familien, and I will mention a few of the principal varietien.

Avalabche and Sanflower are claned together by some growers for atopping. I never find them show too early; my beat liower of Avalanche in 1894 was taken July 29 with five others, and all of them did well; those taken later were much amaller.
Boaquet de Dame, taken on Jaly 20, also Auguat 9, were firt-rate ; Cryatal Queen, taken on August 9 and Augast 22, were poor; Esoile de Lyon, taken on Jaly 29, were almost white, but of good form; those taken August 22 and 31 were also good flowers, and perfect an regards colour-liberal feeding has much to do with the latter point in this variety.
E. Molynenx has almost failed this aeason. The plants were very healthy, and bude were taken on July 29, A ugust 9, 22,31; thowe on August 22 were the best, but were not fall in the centre; in 1891, thone taken on Augant 14 were firat-class.

Florence Davis, taken on Jaly 20, were very fine. L'Enfant des deax Mondes and its parent Louis Boohmer, ahould not be taken too early. Those taken on Auguat 22 were the best here thil season.

Mr. A. H. Neve, taken on July 20, was of no une whatever; others, taken on August 7, 15, 24, and 31, were all good, the latter having the most colour.

Viviand Morel had to be cut back early in May, owing to premature flowering ; buda taken on Jaly 20 and 28, gave fine large flowers, bat without colour ; others, taken on Aagunt 15, were perfect, but not mo large as uaul, owing to having been cut down.
W. H. Lincoln, taken on Jaly 20 and 28, gave good large flowers, bat pale in colour ; and on August 15 proved the best date for this variety in 1893. W, $A$. Divers.

## GERMANY

And they were not Missed! - We read in Moller'a Deutsche Gärtner Zeitung that the Darmatadt nurserymen and florists declined, to the number of thirty-eight out of forty firms there established, to take any part in a recent exhibition held by the horticultural society of that town; and, carious to relate, alys the reporter, "nobody missed them." No one knew the reason for this wholeale non-participation on the part of the trade. Perhaps it wan to show the Society that they were indiapenasble, and that without their assiatance the show would be a failure. However, one good reault of their refusal to show was a very lively participation of the nurerymen from a distance, and the nhow was rendered a much more interenting one than would otherwise have been the case.

A red! Maréchal Niel Rone wat shown. It is one of numerous seedlinge raised by Dr. Müller, and is the renult of a cross between Maréchal Niel and General Jacqueminot, a fact that is readily discoverable in the foliage and in the bloom, which is exactly aimilar to that of Maréchal Niel, excepting in colour -a beautiful deep red. Of all the seedlings from the selfame seed-capule, only this one possessed these utriking attributes, the rent having a more or leas resemblance to General Jacqueminot. This red Maréchal is not yet named; and may never receive a name from the raiser, who is no business man, butan amateur who find his chief delight in the raising of new varietien; taking pleasure in them for a time, and then discarding them for a new favourite. He has the advantage over all othery, in being in the mole ponsesion of certain cromes of Ronen which he can employ in obtaining atill more remarkable renulte.
A Yellow-coloured Kaiseria Auguste Victoria Ross.
We read that Mr. Peter Lambert, of Treven, amerte that he has the above variety, but as yet it has not been exhibited.

## A. Whita Sport of Papa Gontina Rosb.

Papa Gontier in easentially a variety for cutting for market, an almost perpetial flowerer, and very early in season. The uport pomessea all the good properties of the type, and in likely therefore to be of great value to trade growers. It was foand in the garden of a Frankfort-on-Maine nurweryman,
and shown by Mr, C. P. Strawheim, of that city.

Papa Gontier is a vivid pink flower, centre buff, reverne of the petals reddish-purple. Raised by Nabonnand in 1882.

## Oleanders.

Thene rarely cultivated plants, which are such excellent abjects for the decoration of apartmenta, were well shown in flower at Darmitadt by $\mathrm{F}_{0}$ Clasmann, Mayence. The vigorous healthy planta were abundantly flowered.

## MARKET GROWERS AND SALESMEN.

The memorable anying, "Something is rotten in the State of Denmark," has a manifest application to the fruit-growing community in Worcesterahire. I have for nome daya been making an excurtion through the rural districts of Worcesternhirs, and natarally I came in extenaive contact with that induatrion clans known an the market gardeners. It is imponsible to view withous admiration the well-conditioned allotment which they hold, nor can you contemplate their energy without admitting that they are juatly entitled to the practical sympathy and apport of the Britioh public. Strange to eay, this, the seamon of "hops realised," is invariably acclaimed a season of dismay. They have watched the maturing process of their crop with glowing pride. Heaven for its bounty has been rraised; but, alas! there remaina a sting which warps and blunts their eense and enjoyment of haman ecatary. Daring the season these men despatch prodigions quantitien of their produce to Mancheater and other important northern markets. Here they come into the hand of commission agents, whom duty it is to sell to the general parchasing pablic. A few daya later a return is forwarded to the sender, and it is this document, together with the accompanying pecuniary contents, that causes the growe the depreasion and heart-aickneas to which I havertferred. Ia almost countless instances the "proceeds' fail to meet the cont of gathering; in numberlent othera a balance remains againat the grower, whiek he is expected to remit. Theme disappointmenth, together with aundry others of a like kind, are $\mathrm{It}^{*}$. spontible for numerous and serions embarraument which the market-gardening fraternity is perforce made to endure. Grievancen of this chatacter have to multiplied of late years that s serious problem confronte us. We muat either kill the patient, long-auffering gardener, which would mean a huge national calamity, or we must cure the disease. It in deop-neated, nome say, and on the surface ineradicable; but deapite this the obstaclet are not altogether insuperable. Lat growers take heart of grace, show true manly conficence, and hert, to a grest extent, a solution of these diaspointing experiences will be found. It has been suggented to me that the Government should be invited to appoint aalenmen, who should be garanteed a yearly atipond according and in proportion to their capacities. Thin atipend should be paid by the grant of a reasonable commisnion, together with payment of reanonable incidentals. I confess I do not like the principle. State interference would be cumberwome, and before it had been in operation long, it would be discarded as too contly and impracticable. Others anggent that the produce should be old in the immediate home countien, but this contention is too absurd to be for one moment entertained. Large fruit-growing countiee invarisbly have a yield tremendously in excess of local requirements; hence, it is apparent that ${ }^{\text {a }}$ hard-and-fast rule of this nature would soon bo regarded as infinitely worse than the prenast disease. The cuttom would be more honoured in the breach than the observance, and in the end, general demoralisation of the syatem would follow. The only effectual alution that the writer can discover in this: Let market-gardeners organily and form a sound atsociation. Select from its menio bership honourable and capsble men, and to thete entrunt your fature success an growert. The difin culties that would at the outset bestrew their paths an anleamen would vanish entirely as time went an; mutual confidence, forbearance, and collective is
terest would inpire them to succeed, and, that objest attained, past miseries and disaffection would become +ffaced. - Yuara, \&c, Inve-tigatoz.
Powick, Worcestershire, Jane 29, 1895. Manchester Guardian, July 141895.

## AZALEAS AT WALTON LEA, WARRINGTON.

Oor illatatration (fig. 13) represent a profase floral diaplay in the conservatory at Walton Lea, and wan taken from a photograph obligingly

There are some thirty varieties, among which were fine pyramidal plants of Dac de Namera, fa feet high aod 3 .t feet in diameter, in perfect condition Souvenir du Prince Albert, Stella, Dac de Brabant, Model, Flag of Trace, and Baronne de Vriere. The smaller planta consisted of Roi d'Hollande, Mdlle. Maria Planchon, Balsaminifora, Illaminator, and others, all densely covered with bloom. The effect of auch a display of plante, arranged an they were with good taste, was one calcalated to leave a lasting impression on all who saw it. The conservatory was not the only house svailable to the public. They were allowed to walk

## SPYE PARK.

While on a visit laat week to Mr. Perry, the gardener at thi place, I was struck by the beauty of an extensive herbaceona border he had made and planted in the centre of the kitchen garden. This border ran eant and west, and is about 130 yarda long, and 8 feet wide. Choice Apples and Peara line both aides. This border forms a asefal reserve of plants for cutting from, and there is nearly always something to be found in it of intereat to the lover of plants. I noticed flowering profusely the lovely Funkia grandiflora, the odcur of whone flower is very refreahing: Achillea Ptarmica, fl.-pl., to unefal for

Fig. 13.-azalea• hoosb at walfon lea, wabbington
farnizhed by Mr. P. Will inson, Cliff View, Walton, Warrington. The following letter accom panied the photograpb:-"For a number of yearn Jubn Crossfield, Esq, of Walton Lea, has, at different aeasons of the year, generounly opened his gardens to the Warrington pablic, for the inapection of his varied collections of plants. On May 5 and 6 of the prenent year the pablic were so admitted to view the Azaleas, and some 5000 pertons availed themuelves of the privilege, myeelf amongot the namber. The plants were arranged in the conaervatory, a aplendid apan-roofed house 40 feet in length, 25 feet in width, and 20 feet in height, a temporary entrance being arranged to meet the necenaities of the occation. The plants were arranged in one large groap in the centre and on borders about 4 feet wide, which run along each side of the bouse.
through the long range of plant and fraithouses, one of them the famous Camellia-honse 100 feet in length, and 15 feet 6 inches in breadth, containing aplendid apecimen plant of choice varieties. A good diaplay of Orchids was likemne in bloom at the ame time, and an admirable batch of herbaceous Calceolariag. Great credit is due to Mr. W. Kippa, the head-gardener at Walton Lea, who has for many years conducted the work in thene gardens. It is imposaible to visit these besatiful gardens without a feeling of indebtedness to Mr . Crossfield for his consideration of the Warrington townspeople, and I think in admitting them to his place he seta an example which many other pomencore of fine gardens in the neighbourhood of large town might follow with advantage to all engaged in horticultaral paranits.
catting; Chrysanthemam maximam, growing wonderfally strong, with numerone flowers, which wers of unuausl siza; Heuchera sanguines, Bocconia cordata, a tall Cephalaria, with atraw-coloured flowers ; Epilobiame, flowering profarely; Campanalae, of varicat species; Carnations, Migoonette, Dahlias, sce. All the plante were growing with amazing vigoar, and flowering profacely.
Choice Lilies, Gladiolas, which were showing flower very strongly, fill the spaces between the herbaceoas plants.
Mr. Perry finda Cole's Blood-manare very beneficial to the se sabjecte, and he uses it at a top-dreasing for beds of Lily of the Valley, Datzias, and Spireas.
There is a good show of fruit generally; and the houser afforded a rare show of Grapen, Peaches, and Fig*. W. A. C, Compten Baseett.

## BOOK NOTICE

Pflanzen Krankheiten durch Kayptogamische Parabiten verurgacht. By Dr. Cerl Freihert von Tubearf. (Berlin, 1895.)
A work of nearly 600 pagen of closely-printed matter on the subject of plant-diseases cansed by paranitic fongi, may appear to many an, of necesaity, either encyclopsodic and too full of details, or nuperficial, and abounding in wordy treatment; an a matter of fact, whatever the faulte of Von Tubeuf's book, it svoid, both the extremes mentioned. It is a very soberly written and fair digeat of the volaminous literature which ha appeared in Germany since De Bary's fine treatise on fungi atarted the series of workn, of which Brefeld, Zopf, Hartig, Frank, and Soracer are the mont important, in a domain in which Berkeley was one of the beat pioneers, as well as one of the hardent workers and clearent thinkern. Berkeley's chief work in vegetable pathology appeared in these columon.

It is a very common plan in German text-booka to deal with subjects of this kind in two parts"Geaeral "and "Special," and sach is the case here. In the firat part (Allgemeiner Theil) an attempt bat been made to re-cast the usually-accepted classification of the mode of life of fangi under the headinga Paranitim, Matualism, and Natricism (for only by this barbarous equiralent can we consistently render the word chosen), and, we thisk, with bat scanty access, for the etfort to draw sharp linea between the various atages of parasitism displayed by fungi of different species, or by the name apecies under different condition, can rarely be maintained.
For instance, Von Tubeuf substitutes for De Bary's clamification of parmites and aprophytes into (1) Obligate Saprophyten; (2), facultative paraaiben; (3), obligate paranitea; and (4), facultative saprophytes, the following (1), Pure Saprophytes; (2), Hemi-mprophytes; (3), pure paraniten, and (4), semi-parasites, without in eas aubatantial degree improving the classificatory value of the subatituted terms. Indeed, his own account showa that the new terms break down as hopelensly as the old onea before case like Macor and Penicilliam, which behave as if they were paraites on riponed fraite, or Botrytia forms which can penetrate young tissues when the mycelium has actained a certain degree of vigour, and accumalated sufficient poioon or enzymes to atart an entrance by neatling in the firat fow cell. it is enabled to kill.
Nothing is gained bere by calling the fungus \& halfparanite inatead of a facultative paranite; and indeed the latter term is the better, for it expreses more nearly the real ntate of the care. The farther dincasaion of the mode of life of parasitic fangi is happier, and the author has brought together an interesting eerie of new facte, published since the treatment of thene phenomens along vimilar lines by
Zopf. Zopf.
In the section on mutasliam, again, we are driven to the conclanion that Tabeaf it atriviag after a refinement of terminology, which obscure rather than illaminates his aubject. He regards the clansical cane of the symbionis of Lichens as met by the term individualinm, because the result is a liviog being " whirh in it form, life-requirements, and mode of living is completely new, and differs entirely from the two components." Bat thilsavoars of a mere plajing with words, and, we thins, with words singularly ill-chosen to play with.
That the author is right in distingaishing such catel of aymbioniz as those of the Lichens, Witches ${ }^{3}$ Brobms, and so forth, from the casel of Mycorhizs and the leguminoon tubercles, may be at once conceded. He does this by laying atreas on the view that in the latter one of the aymbiotic organism: servet eapecially for the nutrition of its hont--e,g., the fungas of Mycorhiza is regarded as bringing organie food-materials to the root it dwells on or in, and the organivm of the legaminous nodale is
digented by the hout plant. digested by the hout plant.
The wection most interesting to the "practical
ran" will, no doubt, be the chaptern $v$, to vii., dealing)
with predispoition to infection, methods of combating the diseaser, and the practical significance of fungoid direases. The anthor ingiats on the hopelessness of individual efforts to combat diseases which are widespread over areas where apathy or ignorance prevent cooperation; and arges, with conaiderable force, the necensity for experimental stationf, museams, and means for educating the pablic in the technical matters here cu cerned. He then enters into the prophylactic and therapeatic aspect of remedies and measures; and, among other illustrations of the ffficacy of to atment choroughly carried out, quote the followia , without, however, discusaing the econdary effects, Of two parks in Manich, there is one where the leaves are always removed, whereas they are left on the ground in the other: as a consequence, Rhytimma acerinum never appears in the former, but is spread all over in the latter, a fact eaaily explained by the habits of the fungus. The treatment of wound in trees, based chiefly on Hartig's results, also comes in for lengthy discuesion.

The agriculturist and horticultariat will probably be disappointed to find so little asid about apraying of foliage with powders and liquids, bat the three page or so devoted to the subject abound in good sense. Possibly, over-cantion is noticeable about details, or it may be, the author has not fally considered the voluminous literature from America and elsewhere, or has not been able to make up his mind about the reaults. Ramm's experiments with Bordeanx Mixtare, and his idea that the action is due to the copper and is electric in natare [so say the author; but Ramm concluded the action in probably chemotactic] are mentioned, and further on in the book, reference is also made to Frank and Kruger's recent attemptn to show that nome myaterion chemotactic action occur to account for the decidedly beneficial action on Potatos.
Oar own opinion is, that mach remaina to be done along this line of inventigation, but one piece of advice is perfectly sonnd, namely, that apraying must be done with the fallest knowledge possible of the babite of the fungua to be fought, and no mere dates or general directions for the application of these mixtures will saffice.
We may interpolate here what in not ufficiently dwelt apon in the book, namely, that what Rumm and Frank and Kruger find is that the copper-alts affect the host plant, apart from any action on the fungi, by incrasaing the chlorophyll and the manafacture of atarch, by accelerating the maturity and weight of the fruit (Vine) and tabers (Potato), and by diminishing the rate of transpiration. On the other hand, experience alone can decide at to the effect of accumulating copper in the oil, and there in probably no question of greater importance for agricultural and horticultaral committees who have experimental groand and expert advice at their diaposal, to investigate further.
In the special part, which comprises all but 120 pp . of the whole, the plan followed is the aimple and effective one of taking the principal groups of fungi, and treating of their parasitic representatives. In the main, Brefeld's classification is followed. An interesting section on the Chytridiacea, in which fully acknowledged advantage has been taken of Fischer' and Schrözer'i recent monographa, opens the work, and then follow the Oomycetes, in which the far 600 nhort paragraph on the Potato disease will prove the most intereatiag. The fagua has no oospores, bat the myceliam passe the winter in the tubers, a view combated by Böhm, who maintained that we are completely ignorant of the way it wintery. This fungus has been foand on Solanum maricatum in Ecuador, and has been infected into Solanam caribente and Petunia hybrida. It also occars on the Tomato. The use of Bordenax Mixture in recommended and defended.

Pabsing to the higher fangi, the Ascomyceten first receive attention, and a very complete account of the
Exoascese and Witches' Broo Exoascese and Witches Brooms, pockets, \&cc. produced by them is given; Sadebeck's recent work being laid uader fall contribation. The mildew Erywiphex) and Nectria and other Pyrenomycete
follow, including interesting but short paragraphe on Epichlcë and Claviceps. Under the Dincomycen a considerable share of attention is given Woronin's Sclerotinia; and Hartig's account of the Larch disease is accepted in its entirety. The adrice given is, Larches in the low lands (i.e., as contrated with its native alpine heights) should be planted only in airy situations, not in close plantation and never in the neighbourhood of already-dineand
The Ustilaginer receive a very full treatment based on Brefeld's work, and the section on Undineæ is very interenting, owing to the large amond of attention this group has attracted lately at the bands of Erikson, Klebahn, Plowright, Tabeaf him self, and others.
The different varieties of Puccinia graminia en fully give n according to Erikson \& Henning'a recout work (1894), which afford a new glimpe of the compl exity of the problems of heterocism among these fungi. Similarly with the Gymnosporanginm forme, to which also a good deal of attention hu been dir ected of late. Tubeuf has himself worted specially at these forms, and he here gives \& virs full account of the group, with lists of the rarind reault which different authors have obtainel I sowing them on the various Pomact $x$ on which tlisy are hetercesio us. This eection is both interentig and impor tant, and again serves to open up wio vistas in this cifficult domain of mycology. of course, the Witches' Broom on Silver Firs, \&e., the to the well-known Ecidium elatinam reatm attention; an do all the principal fungi whid attack Coni ers and other trees. Many of them latter, especially those which deatroy timber, an Band iomycetes, and Tabeuf hat intrcdaced phot graphic reproduction here-a elewhere it th book-with marked anccess.

T he yatematic or "pecial" part end witt short categorical treatment of the "fungi imperfetl," and phytopathogenic schizomycete and Alga.
On the whole, the author in to be congratulation having produced a book which is decidedly in advance of any of ite predecessors, and which mat be regarded as the mont complete compilation wo possess on the subject. The style is clear, and th print excellent. Fault may perhaps be found with the inequality of the diecusoions; for inatance, the Potato d isease is disposed of in two pagen, wis more than twenty are devoted to Gj mnonporangin; but auch a matter depenc's on the point of viet, wit it is not dificult to conclude that the anthor in elp cially interested in m orphological quention. this as it may, however, there can be no donfo that the work is a aseful and valuable contribation
to science, and will be welcome in all botainal librarien. H. Marshall Ward.

## The Herbageous Border.

## SINGLE AND DOUBLE-FLOWERED PYR THRUMS.

A UBEFDL hint in regard to the above poptly and fiee-flowering group of plants is that given ly the Measre. Kelway - now is the time to platid Indeed, it is more than anefal, it is raluable, ald especially so to those who woald have fine flomath for the year that fullown. But the planting of nath things in Midsummer, with the soil dust-dry in districte, 2 or 3 inches deep, involven a certhiin amount of rink, and probable losses. The latter, how ever, may bo reduced to a minimum by only plarsint well-establiabed pot-plants, not starvelings, then willf no vigour remaining, but such as have been op during prepared daring the past apring for planting anm the present season. There are many, I am invid who adopt ths rough-and-ready practice of divizult these Pyrethrures with a spade at any coaresial time. My own experience goes to prove thamp is nothing to be gained by planting large clump these plants, or even by catting them in b the contrary, such a practice invariably blossome inferior in nize, and thene by no Imen represent the fower in their bent form.
tried aeveral ways and different eeasons, bat fod none to equal that of dividing the plants into emall pieces of, asy, three or four crowneach, and potting them into pots of large 60 aize; then place them in a cold, close, well-uhaded frame for a short seanon till new roots and fresh growth are both apparent. In a month, all being well, they will be ready for planting outagain. This operation is best performed in the early spring, when sbout 4 inches of new foliage has been made, and when the dividing has been carefolly done, the losses are very few indeed. Following thia practice, I have propagated many thousand of these plants. In precieely the same manger these plants may be increased in nummertime after Gowering is completed. At the latter date the plants should be cut down to within 6 inches of the ground, and when new leaves apring from the tafts, lift and divide them in the way recommended above. The planta realting will be ready by the middle or end of Angast, and should be planted out without delay. Sach plants, of course, will not be capable of producing reanalte in the enaning jear equal to thone earlier planted, and for this reason, and the asving of a season's bloom, the apring-propagated planta are mach the best all round. If posaible, get these into their permanent position by the end of May or early in June. Autumn-planting for these Pgrethrume cannot be generally recommended, and on cold or clayey soils they frequeatly dwindle and die ; and, singularly enough, on heavy oils, the plant frequently become a prey to a mall black alug, that demolishes every leaf as soon as it appears. In this manner I have known whole bed to be wrecked daring winter-time, the sloge working anobserved in the trift, in defiance of the unal preventive measures taken to keep slags in general in check. It is a good practice to sarround the plant with coal-asher, as a preventive of the ravages of aluge. When planting at whatever season, the soil munt be deeply worked and heavily manared ; and to secure the best resulta and finent flowern, divide and replant every two years. $J$.

## The Rosary.

THE COUBERT DOUBLE WHITE ROSE.
We had occasion recently to mention this Rose as growing at Kew. It is a form of Ross rugona, o relatively dwarf atature, and large doable flower of great subatance and anow-white lustre. From an article in the Journal des Roses by M. Grosdemange (November, 1894), it appears that this Rowe was raised by M. Cochet-Cochet at Conbert, hence the Rose has been called "Blanc doable de Coabert." It is a most denirable introduction, well auited for bede, shrabberien, or corners.
variorum.
Flowers of the North-west Prairie.On this vast, this seeminaly interminable prairie of the Great North-west Territory of Canada, the flowers are traly beantifal and varioas, and to the true lover of Nature are things of bearty and joys for five month of the year, from the time (May) when that aweet harbinger of apring, Anemone patens. pata forth its light blue cops, not sparingly but by thonasind, till September, when the lovely Gentiana acanlis [?] and stately Sunflower are in fall giory; the coloar of the former being blue as the heavena above it, and the latter brilliant as the jellow aky round the setting sun. The season of these Anemoneshere erroneounly called Crocuses-is nomewhat short, so the flowering is over, and the flaffy heads of seed ripen by the beginning of June. Bat this rapid matarity is not peculiar only to the Anemone, for all vegetation in this land of extreme heat and cold it the same ; ite anpearance is audden, and the growth to the ripening stage simply prodigiour. As the Anemone fade sway they are followed in rapid succession by several kinds of Ranunculus, all being
of a dwarf habit, none so tall as the familise Battercap of the meadows of the Old Country. Then appears, mostly on high ground, in compact clump. a very low-growing plant, which beara a profarion of pure white, almost quare-shaped E วwert. which are evareacent, however, for they last but a week or so . At the same time may be foned, growing in more hamid oil, the yellow Lapin, ite bright flowern being conspicaons from quite a distance. Where the land has been "broken" (ploughed), this plant is almot aure to appear, and continues flowering for several weeks; it produces seed freely. Never shall I forget the delight and sarprise I experieaced when I first came during a botanical ramble upon a fine clamp of Cypripedinm, bearing ten fally-developed flowers, and as I looked with admiration upon this lovely wildling, with ite Orchid-like beauty, it seemed to me to be hardly possible, knowing that but a few weeks before the ground ander its roots was frozon solid for several feet down, that it could retain its vitality in auch trying circamatancen-of auch are traly the wonders of Natare.
Juat now (June 25) the Roner and Lilifs - of which latter, however, I have only met with one varietyare the most conspicuously beantifal; of the former, there are some no dwarf that they almost rest apon the ground, while others are several feet high, their natural growth having almost the appearance of trained standards. The colonts of these hones vary from the parest white to a dark rich red; some are variegated, like the old York and Lancaater, bat all have about them a mont delicious perfame. The fruit, which is produced in abundance, and of aeveral shapen, from perfectly round to very long oval, while some of them are round, with the exception of the top, which is perfectly flat, somewhat like a Medlar. All of them become the food of the prairie chick, and the blaff partridge. The large oval fruit, when fally ripe, can be made into a very nice preserve; this I koow from practical experience. The fiowers are from 1 to 2 inches in diameter, the petals lying wide apart, so that when fully expanded they are quite flat. As $I$ have aid, I have met with but one variety of Lily, which in shape, size, and colour, though somewhat brighter and lighter, with brown spots at the base of the petaip, much resembles the Vallota parpurea, but unlike that handsome plant, the leaves are all produced on the flower-stem, like most other Lilies.
Of Vetches, there are several varieties to be met with on the prairie, all bearing parple flowers, with one exception. which is white, and mach larger; they grow from $\frac{1}{3}$ to 2 feet high. Then there is the "Fairy Flax," which, however, does not 'ope' $i^{\prime}$ the month of May," for it does not come to us till Jane is helf over, when its delicate, fragile flowers expand in great profucion. Of Violets, we have two varieties, the white and the parple, the flowert and foliage being much larger than those of the Old Country; but, alat ! they have no fragrance to waste on the desert air, or awaken fond recollections in the heart of the lonely wettler, for they have not even a suspicion of perfame. Then come the bold-looking, erect, handsome Harpalinms, their rich jellow and brown flowers forming a strong contrast to the elegsat, lightly-poised flowers of the ethereal Harebell, which may generally be seen growing in close prozimity to its more robust sinters. Two varieties of Aquilegia are to be met with here, a dwarf and a giant; the foliage of the former is aimply exquinite. being quite as beantifal ae Maidenhair Fern; bat the flowers are insignificant. The tall giant variety is to be met with only in the "blaff " (woods or bush), where it grown to the beight of 4 and 5 feet; the foliage, though like that of its little siater jast mentioned, is very mach larger, and of greater sabstance, and although bandsome, is comparatively coarre ; ite flowers, also, are no great attraction. The Dairy we have-not the "wee crimson-tipped flower," bat a pare white, with eeveral flowers on each atem, which in sometimes 4 or 5 inches long Of elegant Meadow-sweet there is an abundance, scenting the air with ite fragrance. Pyrolas abound in moist shady placer, their round, brond, frm leaver, and charming Lily-of-the-Valley-like

Alowers frequently covering the ground to the exclasion of all other plants. Auriculas, also, in bere the groand is bumid, bat exposed to tild fall san, are to be seen by handreds in one place; the foliage and flowers, the latter of a light pa-ple with yellow centre, are maller than the variaties in cultiration, bat they have the charac'eratic of their fetted siater of being powdered. Thert apats be seen wide patcher, extending exeral gards scrons, of a beatiful miniature white Evela ting-H, wer, which when gathered when jast in full bloom, will remain fresh and firm for years. I have nome auch which I gathered four years ago, and they are as white and perfect at when firat taken from the prairie. T. S.J.

## Plant Notes.

## heuchera sangunea

In thi very droughty seamon, the above pretty herbaceou: perenaial il exceptionally free in flowering. I recently obarved a nice bealthy batch of it growing with great freedom amongat the many ueful things to be found at St. Clere Gardenf, Kemsing, the seat of Sir Mark Collet which gave me a more favourable impretsion of the plant than heretofore, Its deep-red flowers on atems $1 \frac{1}{4}$ to $1 \frac{1}{2}$ feet high had a quite charming effect in the mass. The gardener at St. Clere's apoke highly of it as a pot plant for the conservatory and greenhouse, and of his intention to grow a good number in pots another season. The plant is readily increased by taking the side-shoota and dibtling them into a randy compoat under a handight, or by severing the young rooted shoots and planting them on a north border at aboats 14 feet apart, to be lifted and potted at a later date. A native of northern Mexico, introdaced in 1882. H. Markham.

## Nursery Notes.

## ALLINGTON NURSERIES, MAIDSTONE.

For many years, with mawavering determination, Menors. G. Banyard \& Co. have been adding to their already extennive fruit narseries, till at the present time it may be aafely anid to contain one of the finest collections of fruit trees in the world. The thousands of young trees, clean, healthy, and free of growth, found in the Allington Narseries of the firm mast be seen for their general excellence to be comprehended. The area under fruit treen is apwards of 100 acres, and the 20 acres recently added have been trenched two spits deep, and are well filled at the present time with healthy planting staff. The trained Peach and Nectarine trees are examples of good management, and being worked on a free.growing variety of stock, any of them would, with due attention, quickly cover a large apace on high walls or trellises. There are 50,000 trained trees in the nurnerier, exclusive of cordons. Almost every known variety is kept in atock, but only the mont approved varieties are extendively caltivated.

Applen were remarked planted in "driftn," ranging from 30,000 to 70.000 in a drift, and the wood is vigorous, the foliage ample and of good coloar, and in many inatances well stadded with flower-buds. In one equare I obsesved 38,000 dwarfo worked three years ago, which were in most cases carrying a capital lot of fruit that promiren to grow to a fair size. It is a matter of surprise how well thene miniatare trees frait, and how bright the colour of the fruite, more $s o$ indeed than from some trees that are cultivated in pota. Plums and Pears are extenively grown, but the latter not in auch large numbers an Apples and Pluma.
One might reasonably have imagined that the drought would have crippled the growth of many of the young trees, but this is not so, the aumerous fibroue roote penetrating the soil in every direction, enabling the plant: to grow unchecked. O wing to
tho regularity conatantly at killing weeds. rees, and, as a fact, it is in the and.

A fiae plantation of Rhases, consisting of some 10000 , was notod, whict, a reparde the Higbrid Perpatuals, passei winter without a plant being any the he bard and long frot. The Tean suffered neven v, eeppecially those badded an stazuarde, ...... "he largely where covered with anom. riesties of fraits from all parta are bein 1. $H, M$ 。

## Trees Anll Shrubs.

## hedy jarum nultijugum.

Tus plant han naturally a loowe straggling babit. The leaven acarcaly pxeand 5 inches in leggth. The racemes are erpet, looge, with fifteen to reventeen flowors, gencrally fowatp; each flower is about $\neq$ iach long, whlet of somy-hlac, becoming blacish as it withers. The pod dipiden into three or foar, flathened, orbicalar disc \% s. add with tootr ' in pr. jureinna from the atnres, and from the centre of tha valve of the carpel. We hare now seen mpentmen from Meters. Barbier, of (OHeana, the Royst fruritors Kow, and the Botanic Gardea, Catupridet, an substantially alike, and in accordanca whe hegal's iusure.

> Colonial Notes.

## THE GOLD COAST.

We learn from the Krw Bulletin that Mr. C. H. Hamphries has been appointed to ancceed the late Mr. W. Crowther as Curator of the Botanic Garden at Abari. Mi. Humitirim bae had three jears experience in the tropical department at Kew, and had previonnly been with Mesors. Keiway \& Son for niad years.

Mr. J. C. Moore hav recpived the appointment of Carator of the Botanic Station, Sto Lacia, West Iadie. Mr. M antw momoloyed before entering at Kew at the garde:... is..adland.

## The W玉sk's Work.

## TEE EAKDY NRUIT GARDEN. <br> Bty W. Popt, Gwed ner. Bighclere Castle, Newbury.

FIG TREES: THINNING THE FRUITB.-It will be pecoseary whera the frate are numeroas to thin them, so st to obtain good size and fine quality. First, those which are toin-shapen from any cause should be removed, then all anderuiz dand late onem. Continue to remove muperflucus noots, wo as to admit munhine to the fruits, and to the shoote reserved for fraiting uext year. All foneright shoot should also be cut awsy! and thort jointed, atardy growth laid-in in nafficient numbar to duly cover the wall-epace withort crowding.

THE BUDDING OF sTOck8.-At this seavon bazuing may be purvomet if a number of raitable tocks have buen prepared. The beat bads will be found on half ruprand shoots of middle mize, woodbuda, that in, such as will produce a bhoot only, being taken. Such bade are readily dietinguinhed from blom-budn by their more elongated and pointed in shape. Be careful to choome healthy, freegrowing ahoote, and not to take them sooner than they are wanted for innerting in the tock. Of covrne, if they have to be aent to a distance, the shoote should be bundled ap is damp mons or the like, and when unpacked, they should be immersed in water for a few houre before making nue of them. The budder must be provided with a pail or wateringcan in which to place the shoota, ataodiag the buttoud in the water havirg firet cut off the blade of every leaf, bat retaining toe stalk. This latter will arve to protect the bud a little, and is ueeful as a handle pherewith the bud-shield may be pashed
into place. Having cotton, soft rafie, or Rasuian bast. cut iato suitable-Ray, of $1 \frac{1}{2}$ feet-lengths, one or two kniven, and a hone, in readinesf, select a saitable bud, and, commencing at its lower end, cat a slice of bark and wood about $1 \frac{1}{3}$ inch, or slightly less, in length, with the bad occapying the middle point; then carefally remove the small portion of wood left in the bark by inserting the end of the knife-handle at the proper apper end of the bark, bend back the alip of wood, which, if the shoot be in a suitable condition, will readily eparate, leaving mo depression or pit bsapath the bad. If a pit be left, the bud is useless. Having made the bud, cut a alit lengthwise in the bark of the stock about 1 inch in length, and at any denired heigbt from the ground: make a cross. cat at the top of the slit, raise the bark a little on both sides with the knife-handle, insert the bad at the point where the cross-cat is made, and push it gently bat firmiy to the bottom of the slit, catting off any of the shield which may overlap the crosscat, and bind-in the bud firmly with bast or buddingcotton. The ligatare will require to be loosened in about one roonth afterwarde. The atock should not be cut back till the autumn or winter, when it may be removed ail bat aboat 6 inches above the bad and in the following enmmer, when 10 or 12 inches of growth have been made, this sagg may be cut off close to the young bboot.

## PLANTS UNDER GLABM.

By W. H. Smith, Gardener, West Dean Park, Chichester.
FERNB.-These plants should now be afforded water in abandance, it being almont impossible to afford too much if the pots are filled with roots, and the plants growing atrongly. Weak manure-water, applied twice a week, will do them good; and nome much diluted soot-water, now and again, will ba found to keep the frond of a good green colour, eapecially if epplied to nuch as have not been repotted this year. When there is a large call for the fronds of Adiantam caneatam, a cood number of the plante should be placed in a frame facing the north, choosing those which have nearly finizhed their growth. This cooler treatment will tend to harden the fronds, and they will last mach longer when cut than tho not manipulated. Tree Ferns abould be examined occasionally for thrifm, or the fronds will soon be spoiled. Sponging them with weak tobacco-water is one of the beat and moat effectual mean of ridding the plants of this peat. [Vaporising with XL All in likewise safe, and a great arving of labour. E.d.]
orange trees.-Thone treen which have net their crop of fruite may be freely syringed overhead. afforded liquid-manure occaaionally, and ventilated freely. All rank thoots, and such as if left would tend to apoil the symmetry of the crown, may be cutin. Any trees infested with aphis should be well famigated, and the leaves cleaned by aponging with soapy-water; afterwards, occasional syringing will keep them clean. Scale is sometime very disfiguring to the trees, and must be got rid of by washen. Trees that were not repotted or retabbed whould be examined as regards the drainage, and top-dressed with rich sandy loam after removing the old soil. It will do the treea no harm, but rather good, if they are atood out-of-doors till the end of August. If they have been growing in thaded housen, it will be adviable not to put them at first in full mushine, although they will be able to bear it sfter a week or
two of exposare.

BAMBOO8.-If thene are grown in pots, they may, if apace be required in the conzervatory for other thinge, be put out-of-doorn, as for instance. in the sab-tropical garden, planging the pote in the beds or in the turf, but finer growth will be made if they are left indoors. Bamboos require plenty of water at the root, and a top-drening afforded every fortnight of Clay's Fertiliser and soot. Bamboo make good-sized bushen when grown in comparatively amall poti; but if large planta are wanted, they munt have good-nized pots, and the present is a good time for repotting. A suitable compost is made of fibrous loam, peat, leaf-soil, foinch bonem and charcoal. A few snitable speciea for pot culture are B. arundinacea. B. mitir, B. atriata, B. violancenm,
B. Simonis, and B. nana.

BCENTED - LEAVED PELARGONIUMS. - Thene plants are general favouriten, and very usefal for conservatory and other unen. Small young plants may be potted into $48^{\prime} \mathrm{s}$ and 32 m and atood outside, and when the potn get filled with roots, stop the ahoote by nipping iff the pointe to give the plante
bushinese.

FANCY, BHOW PELARGONIUM8, \&C.-Pat in cattinge of these, chooning for the parpose aboots that are half-ripened. In the catting-pots ase andy lorm and leaf-soil, and place them in a cold frame close to the glass, keeping the frame close until roots are made. The old plants, after the cattings have been taken, should be stood in a sunny place out-of-doors, and kept somewhat dry at the root for a time, praning them hard back towards the end of next month. \& number of Ivy-leaved Pelargoniums may now be potted, and have three or four stakes put to each, around which the ahoots may be trained. Keep the flowers pinched off till within a few weeks of the time that they are required to flower.

## THE ORCEILD HOUSES.

By W. B. Whitr. Orchid Grower, Bupford, Dorking.
CAT TLEYAS AND LELIAS - In a representative collection of Cattlogas and Lælias, there is acarcelp a week in the whole year in which there is not aume mpecies or hybrid in flower. At the present time the C. Eldorado in variety in attractive. The flowersheat he come up trgether with the new growth, and by the time the perado-balbs are quite formed, the flowers bave pushed up out of the sheath. The blooms, when open, have a delicious fragrance, and in a dry ish atmosthere they will last in beanty for several weeke. While the plant is flowering it needs careful watering, at too much moisture afforded at this time causes the fleoby, half-matured growth to decay; and this not eeldom ends in the lons of the plant. On the other hand, the plant should not be kept dry at the root, but should receive just as much water as will keep the compost slightly moist, and much less moist when the blooms are cat, and the new preadc-balbs fully made up, C. Eldorado and its varieties, pplpadens, crocata, and Wallinii have often been imported, but artificial cultivation doe not agree with them for many yeara together. For several years past our plants have been grown with the Mexican Laliar, but their progress has not been quite astiafactory. When they began to grow laat April they were experimentally placed in a warmer-house, where an even atmonphere is maintained, and kept more clovely shaded than before. The reault was that every plant, even those that were fast deteriorating, greatly improved, and acarcely a growth failed to produce flowers, the mgjority of which carried from two to four good-sized ones. On the completion of growth they will be placed at the least warm part of the Cattleya-house. New root will pash out from the base of the flowering bulb in a few weeks time, and the old roots absequently throw ont a quantity of ahort rootlets. It is at this time that repotting ahould be performed if any of the planta atand in need of it. Cattleya gigas, C. Dowiana, C. D. aure and C. rex may also be repotted soon after the flowers fade. After repotting any of these planta, water ahould be very sparingly applied, just enough to encourage the roots to grow and to preserve the old ones in health. When re-establisherl gradual exponare to the an's ray is necenary to mature the growth, and prepare the plants for their long rest and unless they are properly ripened prematars growth may reault.

ARPOPHYLLUM GIQANTEUM AND BPICATUM:Among Orchids that are not generally cultivated are thewe two species, which are attractive enough When meen with a dozen or more strong bloom-spikes. Both succeed in well-drained pots in a misture of peat and aphagnam-moss, if accommodated in s light part of the intermediate-house and plentifully supplied with water.

MIBCELLANEOU8.-A charming miniature botanical species now flowering is Polycycnis Leth manni. Its flowers have some resemblance to the Swan-neck Orchid (Cycnoches), and it lip is prettily spotted. At the present time it is lept in the intermediate-house, growing in a havg" ing shallow pan with the ordinary Orchid compons to root in. In the cool-house, plants of Epidendrum vitellinum are starting into growth and will be afforded fresh materials to root int without delay. They grow the beat in manll poss in a mixture of peat and sphagnum-mons, the crown of the root being kept above the rim of the pot, the new growth turning black if they are in contact with the noil. Lelia harpophylla may also be repotted, keeping it with the Odontoglomam for the present. This and the preceding apecies grow belf standing down upon the tage amongat other plantas When hang up, the dry carrente of air which reaci them through the top ventilators seem to act
injurionaly on them. An extremely beautifal

Orchid now in flower, is Parius Humblotii. Although coming from Madsgascar, it does not always grow as atiafactorily ander the treatment given to plants from that country, on the contrary, aucceed in a ehady part of the Cattleya-hoase. When in full growth, much water should be afforded, bat no overhead ayringing, or the young breaks become potted, soon decaying. Yellow-coloured thrips infest the growthe, doing mach injary, and being minute, are not readily seen. It iagood practice to dust tobacco-powder into the growth occasionally, or place the plants in a house which is being vaporised. Some growers prefer to une tobacco-paper for the destruczion of thrips, but the tender leaves of the plant in question are sometimes injured by strong fumigation. Oibers occasionally dip the plant into nome afe insecticide, taking care to shade them from the sun's rays for \& few day afterward.

## THE FLOWER GARDEN

By Batley Wadds, Gardener, Birdsall Gardens, York.
bulbs for the spring garden.-The time for ordering bulbs of the florist is now at hand. Single-flowered varietie of Hyacinth are the best for bedding parpones. Good rede and crimsons of these are-Amy, La Reine des Jacinthes, Lord Macaulay, Veronica, and Robert Steiger. White: Grand Vainquear, La Grandesse, Voltaire, and Grand Vedette. Biae: Baron Van Tuyll, Bleu Mourant, Charles Dickens, Marie, King of the Blaes, and Uncle Tom. Yellows: Fleur d'Or, Htroine, and Ida. Porcelain-blue: Czar l'uter, Grand Lilas, La Peyrouse, and Regular. Doubleflowered varietie for bedding are - Whites Anna Maria, Jenny Lind, La Duesse, and La Souvenir d'Aavergne. Red, rose, or crimson: Alida Catharina, Bouquet Royal, Charles Prince of Sweden, Groot Vorat, Princess Louise, and Rogina Victoria. Blae: Garrick, General Antic, and Oihello. Yel low: Gethe. Double and single-flowered Talips for a bright diaplay of colour are more eatisfactory in the apring-garden than any other kind of bulbs for beds, or for planting in patches of six or eight together in the herbaceons or shrabbery borderm. A few good early aingle varietie are Dac Van Thol variou, and Artus acarlet; Brutus, orange-crimson; yellows, Canary-bird and Chrysochlora; reds, \&c., Crimson King, Cramoisie superbe and Duchesse de Parme, red and gold; yellow and orange, Golden Prince; La Grandear vermilion-coloured. $O^{*}$ Pottebakker there are several beantifal varietien. Prowerpine, is beautifal dark rose; $Q$ ieen of the Netherlands, rose; Queen Victoria, white and crimeon, Royal Standard, white and cerise; La Raine, white; Thomas Moore, orange. Early double-flowered varieties are Agnea, Bcarlet; Arabella, carmine; Dıke of York, dark rose with white border; Gloris Solis, reddish-brown with jellow edge; Grenadier, scarlet and gold; Imperator Lady Grandison verment La Candeur, white Led ; Prandison, vermilion; Premier Gladstone, red; Parple Crown, blood-red; Queen Victoria, red and white; R9x rubrorum, scarlet; Rase varieties; White; Tournesol, scarlet and yellow late doable Velvet Gem, crimson and yellow. Good Marriage de varietiea are alba maxima, white Pæony, deld-striped Fille, white flaked with red Rose, yellow, wweet-scented. mundi, rone; Yellow thould be largely planted for mixed borders.

CROCU8E8. - In continuation of my list of last Week, I now give a list of antamn, winter, and tpring-
flowing Crocuses. The flowera are attractive alwayn, and especially those of the early spring, Which appear at a time when flowers of other genera are fem. If planted in the borders of herbaceous plants, in in the foreground of thrubberies, they may stand beds alon of twelve or twenty; for edginge of flowerArabis alpina, Ivy, \&rc, innction with edging of appesrance. Good varieties of Crocus versicolor
are, whites. Chimholm, Quiteen Victoria, Mont Bianc, Caroline and parple $R+1 n e$ Blanche, Grand Conqueror; blue Baron pon Margot, Prince Albert, David Rizzio, Sir John Franklin, Lord Darby, Lord Palmereton, Giant Gulden Yellow, L'Uaique, Othello; yellow, Gold, Albion, Bellow, Old Galden Yellow, Cloth of Patte, Preaident Grant, Nette, Lady Stanhope. Miss Sotit. Other apecies of Crocus are anreus vernar atriatus, nuaveolens, Inperati, odorne, albifnarue, flowering at the end of winter, ondorus, albiflorus,
and April. The autump-flowering species are stivas, bcrotinas, Pullasii, nudifloras, and speciosas. GALANTHUS NIVALIS AND NIVALIS FL-PL., the double and single varieties of the common Snowdrop, should be largely planted in clumps by woodland paths, or under the shade of tref near drives Choice varieties for planting in borders in the garden proper are G. cancanicur, G. Elwesii, G Imperati, G. latifolias Redoatei, G. robustus, and G. plicataf.

ERANTHIS HYEMALI8.-The winter Aconite, the hardiest and earliest spring flower, is a useful plant for covering the moil under the shade of trees, and it is effective as an edging to flower beds. It is a plant of lowly growth that look beut when planted in masse together. It will grow in any kind of oil.

DAFFODIL8.- No bulbous plants better repay the care and attention bestowed on it than Daffudila and Narcinaus. The plants look well either as masem in beds, clumps in the borders, or in other ways, and they never fail to give satisfaction. The woil for Narcissua may be the ordinary anil of the garden, or it may be made up of loam and leaf-mould with quite rotten manure. The drainage should be thorough, or they will do no good. The land should be deeply atirred, and in manaring it, the manare should be put deep enongh, not to be brought into contact with the bulbs ; and before the latter are planted, it should be made quite firm. Planting may be done at depths varying from 4 to 6 inchem, according to size of bulbs. A few good trampet Daffodile are bicolor, Horefieldi, Empreas, Grandis, Dean Herbert, cambricus, Colleen Bawn, Fred Moore, Johnstoni, Madame de Graaf, princeps, Psendo-Narcisatas (the Lent Lily), Shirley Hibberd, Iacomparabilis in numerous varietien, both single and double-flowered. Many other species and varietien are to be found in the bulb dealer's lista.

JONQUILS-If these wweet-wcented flowern are planted, it should be only in sheltered parts of the garden in bed of gond rich noil. The best are the double and single-flowered OJoras, Campernelli major and O . C. minor.

## FRUITS UNDFB GLASB

By Rrohard Parker, Gardener, Goodwood, Chichester.
muscat Vine8.- Vinerien in which are ripe Grapen, will require to be very carefully ventilated, otherwite the berries may be affected by rust, and this is likely to occur if they are cooled by air being allowed to circulate rapidly through the houses. If the borders where the berries commenced to colour were efficiently watered, and covered afterward with atraw, the Vines will require no more water till the crop is cut, but an the prement season is a particularly hot and dry one, it would be well to examine the border occasionally, to ascertain if the soil is approsching dryness, a dry soil soon causing shrivelling of the fruit, and hisdering the development of the young wood. As a bhade to the Vines, a Strawberry-net may be fixed on to the roof to mitigate the fierceness of the sun's ray. If bat a few bunches remain on the Vines, it will be advisable to cut these with several inches of wood, and bottle them; then the vinery may be thrown open, and the foliage syringed daily. Later crops of Muscat should be assisted with abandant supplies of water at the roots. The borders ahould be malched with cowahed manure, and afterwards afforded tepid water in quantity. Where the roots are in both outside and inside borders, the former should be lightly forked over, and manare and water applied as advised for the latter. Afford mupport: to the shoulders of buaches when necessary, uning broad atrips of matting for the parpose, and where necensary remove a berry or two to prevant a too great degree of compactiese.

OTHER VINEB. - The Madrasfield Court Vinet have, so far, given no trouble this neasov, the fine weather enabling us to afford ample ventilation. Continue to keep a gentle warmth in the pipes during the night, with a little ventilation on the top-lights.

Late vineries.-The fruit of Lady Downes and Gros Colmar which has to be kept throughout the winter should be freely thinned. In many gardens the first-named variety will be at that atage when calding is apt to take plece. So far, I have not seen a trace of it yet; but the vinery in freely ventilated during the day, and no water ir made une of in the vinery after 3 P.M., at which time the borders and walla are copionsly syringed. A slight circalation is kept ap in the pipes during the night, while at the same time a fair amount of sop-ventilation is
afforded, which prevent mointare from settling on the berrien. Kaep all lateral growth pinched back and treat the borders as advised for Muncats.

GENERAL WORK - All fruit-houres from which the crops have been gathered hould be throw o open and the roof-lighte removed where portable. Sgring the foliage copiously morning and evening, aud set that the roote are well sapplied with mointure.

## THE KITCHEN GARDEN

## By Johir Lambert, Gardener. Powia Cantle, Welshpool,

GHERKINE, VEGETABLE MARROW3, AND GOURDS -Tae soil between the plants should be forked ap as the bine grows, and the latter should be thinned out whenever it becomes crowded. O:namental Gourde and Pamplin ahould have a piece of alate placed under the fruite, so that they may be lept clean. Remove the leaves bading the froits of Pumpkins and Guards, so as to afford them the fall benefit of aulight to give colour to the skin and ripen them perfectiy. Afford heavy application of manare-water occationally when the frait is $\begin{gathered}\text { welling }\end{gathered}$

CARDOON8 mould not be planted in exponed situations, or the wind will break and injare the tall leaf-atalks. The plant will now require abond ance of water at the roots, and eyringing in the evening.

8ALAD8. - The seed of Lettuces mut be somn at intervals of a week or ten days, and batchen of plant pricked out weekly. The land elected for the crops at this season should be such as does not get the whole day's an, and which is in good beart. Rudimhes, Eadive, and Mastard and Cress shoald be nown at short intervals. Radishes do very well on east or weat borders, and in very light soils on aituations facing north. Eadive will grow almon anywhere, if care be taken not to apoil it by crowding the young plants together.

PARSLEY.-Continue to tranaplant Parsley whenever the weather in favourable for tha jb, remem bering that one can hardly have too much of iso Transplanted in the present month, Pursley makea atrong growth before the winter ; and tran planted Parsley is, I think, better for withatanding frost than antranaplanted. Piant 6 to 8 inche apart, and in some convenient place, where it may be readily covered in case of need.

CABBAGE -If a bed of strong stocky planta be planted at about this date, they will afford heads for lat autumn cutting. The planting should consist of early-hearting, compact-growing varietien, and it should be frequently hoed to keep a loove aarface, and afforded copious waterings in dry weather. Towards the end of the present month the first sowing of reeds of red Cabbage may be made broadcant in beds thinly, or in lines 1 foot apart, thinning the seedlings betimen, so an to obtein tocky hort-stemmed plant.

SEAKALE. -The beds may be occanionally dremed with agricultural salt, applying it lightly just before rain. Do not let flower-head develop, but cut them off at the groand-level when observed.

MIBCELLANEOUs.-Clear off the remains of exhausted crops of all kinds, thus preserving a tidy appearance in the garden, and the land from unnecenary impoverishment. Wherever time admita of it being done, nach land should be manared and dug in readinest for cropping.

Growing Aquatics.-Oace upon a time the writer of thil paragraph was invited to a nursery celebrated for its large business in connection with the growing of water-plante, or, at they are commonly called, aquaticn. At the locality was far away from lakes or ponds, much curionity way felt as to how the large quantity of plants was cared for. It was found that nearly everything was being raised in old kege or barrels, sunk deep into the carth, and where water could be led into them by a hove or other
methods. The hint may be taken adrantege of by those who read of the beanty of aquatics, but do not have laken or pond of their own to grow them in. Old paint-kera, or any venseln that will hold water, can be buried partly in the earth, filled with water, and seede wown; or young planti planted in mud placed at the bottom of the water. Mauy of the maller kinds of water-plantm can be grown in this way without any serious difficulty. The vesmels need not be water-tight. "Meahas's Monthly" for July,

Newspapers.-Correspondenis sonding nowospapers should be carspil to mark the paragraphs Ehoy with the Editor to see.

APPOINTMENTS FOR THE ENSUING WEEK.

CORRECTED AVERAGR TEMPERATURE FOB THR ENSU ING WEEE, DEDUOED PROM THR OBSERVATIONS OF YORTX-THRER YEARS. $\operatorname{AT}$ CHTSWICE.-63:4.

Kamination in
THR class lists of the last examiHorticulture. nation by the Royal Horticultural Society have been issued, and from them and the examiners' report we call the following particulars. It may be mentioned that the oandidates ome from widely different parts of England and Scotland, a centre being etablished wherever a magistrate, or clergyman, or sohoolmaster, or other responsible persoc accustomed to examinations, would consent to superintend one on the Society's behalf, and in acoordanoe with the rules laid down for ite conduct. No limits as to the age, or position, or previous training of the candidates were imposed, and the examination was open to both sexes.

## Exanowiras' Berport.

To the Council of the Royal Horticultaral Society.
Gentlemen,-We beg leave to report that we have examined the papers of the candidatea who offered themelven for examination in Horticalture in May 1895. There were 169 candidatee is all, varying greatly, as unal, in age, occapation, and in the menne of instruction at their dieposal.

Three hundred marks were allotted at a maximum, and all candidates who obtained 200 mark and upwards were placed in the firt clans. Thowe who received between 150 and 200 marks were placed in the recond clant; and thowe to whom 100 makk and upwards were adjadged were ranked in the third clan. The remainder, who obtained fewer than 100 mark, were not clansed
In this way 12 candidate were adjudged worthy to be placed in the firat clasn, 37 in the aecond, and 73 in the third clasa. Tae highent number of marks obtained we 260, by Mise A. U. Gunvin, of the Horticultural College, S wanley.
Connidering the opportunities at the dieponal of the candidates, the resulte may be convidered satie-
factory. The effect of continuou syatematic training is well exemplifed in the class lists. On the other hand, many joung gardenern and mechanica, who cultivate amall gardens and allotmente, but who have not had the opportanity of regular tuition and syatematic atudy, have taken a lower place than they otherwise would have done, because they have failed to grasp the aignificance of the quentions.
We have the honoar to be, gentlemen, your obedient servante,

June 15, 1895. Maxwrll T. Masters,
Jane 15, 1895. Jas. Dovalas.
We can only find room for the names of those oandidates who were placed in the first class, bat we may add that the fall list will be pablished in the Journal of the Society.
Maximum number of Marks obtainable, 300. No. of First Class. gained.

1. Mism A. U. Galvin, Horticultural College, Swanley
2. Mr. Geo. Butcher, gardener, 188, Wellfield Road, Streatham
3. Mis F. M. G. Maklethwait, Horticultaral College, Swanley
4. Mr. Brown, Horticultaral College, Swanley, Kent
4 Mine Alice Hatchings, Horticultural College, Swanley
5. Mr. J. Warner, School House, Weat Street, Dorking
6. Mis Madeline Agar, Horticaltaral College, Saraley
7. Mr, G. H. Cave, 16, Gloacester Road, K $\rightarrow$, Surrey
8. Mr. W. Bell, Kaighton Road. Leicenter
9. Mr.

Edward Damper, The Gardent, High Asharst, Dorking
11. Mr. J. K. F. Jack, Horticultural College, Swanley.

1. Mr. H. W. Ganaton, Frenningfield, near Harleaton, Norfolk
The questions put were as follows:-
Eight queations only bad to be answered: four from Division A, inclading No. 5, which had to be anawered by every candidate, and four from diviaion B.

Divigion A.-Elementary Principles.
1.-(a). What sabstances do planti absorb by means of their roots? Explain the process of absorption by the root.
(b) What element do plant obtain from the air, and by what agency do they obtain them?
2.-Explain the effect on flowering planta of an adequate, s deficient, or of an excensive, amount of heat.
3. -How are "cattings" made? Describe the changes that occur during the process of "atriking."
4.-What are the objecte nought to be obtained in digging the aoil?
5.-Write as full and orderly a deacription as you can of any plant in common cultivation, through all atage of ita growth, from the germination of the embryo to the formation of the eeed.
6.- What organa of the plant are reprenented reapectively by an Onion, a Cabbage, a Potato, Beet, Turnip, and a Pea-pod?
7.-Dacribe the mode of growth of the common Mahhroom.
8.-What is meant by "greenfly"? What in the bent application to rid plant growing out-of-doort of this pest?

## Diviarow B.-Horticultural Practice.

9.-Name six of the beat specien of hothonae flowering planta, and give wome of the general detail of cultare. Name nome of the insect pents that infest auch planta, and atate the bent method to be adopted for their dentraction.
10.-Give general details for growing Pean, and the method of culture, time of nowing, \&c., to give a supply for as long a period as ponible. What in the ase of the nodule on the roots?
11. What is an alpine plant, at the naxe in generally underatood in gardens? Describe the caltural
requirements of such plants, and the beat way to propagate them.
12.-What is the original parentage of Cauliflower and Broccoli? Give the method of cultare, and the beat varieties to obtain a succeasion all the gear round.
13.-Give some details of the calture of Grapvines ander glass. Dancribe the disease to which they are subject, and the insect peste which attack them, and their cure.
14. - What kinda of fruit trees and bushes are best adapted for calture in mall gardens? Briefly deacribe the best method of culture, and arrangeo ment of the trees and bunher.
15. - In a walled garden, what kind of frait treas would you recommend to be planted on the four aspects-aouth, north, east, and west? What distance apart should the treen be? Saggent the bent width of the borders and height of the walln.
16.-(a). What do you conaider the beat clam of moil for fruit trees, and how ought it to be prepared for them?
(b). It there any method of culture likely to provent canker in Apple trees or gumming in Apricots, Cherries, and Plams?

A glance at the above extract from the olam list is sufficient to show the great advantage afforded by training and systematic study. Even when oandidates are approximately equal in their natural abilities, and knowledge of the subject, those that have been specially trained, as at Swanley, have the great advantage of being able to utilise their knowledge. We believe that many candidates fail, not so much from aotual lack of knowledge as from want of care in reading the questions set. For the last two or three years candidates have, we leam, been asked to describe in their own way any plant they pleased, or sometimes a particular plant has been specified, such as a Potato or an Onion, the plant selected being always one with which candidates might fairly be expected to be familiar from constant handling or observation. Now this question is in many cases either shirked entirely, or the candidate gives the details of cultivation concerning which nothing is asked. This seems to show that candidates trust too much to knowledgo derived from books or lectares, and that they do not ase their own eyes or trust to their own powers of observation and inference.

Our fruit Report.-Our tabalar report on the condition of the frait crop in Great Britain and Ireland, will appear in our inaue for Augut 3. The remarks on the crops kindly furnished by our corres. pondents, will appear in aubsequent numbera
hand list of Herbaceous Plants Cultivated in the Royal Gardens, Kew (sold at the Royal Gardens, Kew).-A unefal list of alpins and herbaceous planta cultivated at Kew, and name bering about 6000 apecien. For the convenience of cultivatora the list ia printed on one side of the puge only, leaving the other free for the addition of further entrie or remarks. We notice nearly ninety entrie of Lily namen-italf a refatation of the once-held opinion that Lilies could not be grown at Kew. Now, even other bulboan plants wed for decorative purpose are grown at Kew by following the same plan that is adopted in Holland. The value of the hand-liste an furnith ing a common nomenclature is very great. More over, the list necesmarily inciude the beat kide up to date, and thus superseden the balky catalogat which inclade all sorte, good, bad, or indifferent, is or often out of caltivation.
"The Kew Bulletin" for Jane and July contains a variety of interesting matter. In addi tion to noten on more or lens well known aubjects there are technical descriptions of aewly-form plant in the Solomon Islands, the Transvaal, Natah

Lagoa, Somaliland, and nouthern Arabia. In an article on the Sugar Maple and ite producte, we are glad to see the editor retain the best known name, A. ancharinum. The "accharinum" of Linaxis whe, it appearn, the pecien now better known as A. daycarpam, Sir Charle Wager' Maple. Gonsypinm Stockaii, Masters, connidered to be the origin

Street, Victoria Street, London. At 3 o clock a papar by Mr. P. Brotarrsion on "The Carnation in Scotland," will be read.

CanNas. - We recommend all interented in these gorgeous planta to viait the collection now in blcom at the Royal Horticaltaral Society's garden at Chiswick;
ground-very fine. Some of the newer kinds sent out by Meneri. Padr \& Son are equal to thone diutributed by Crozy.

Epping Forest. - The Raport from the Epping Eureat Committee to the Cuart of Common Council has bean published. It deall with tha allegod uadue

Fig. 14.-hmmbscallis aurantiacos tar. major. (amis. 62)
of the cultivated forms of $G$. herbaceum, and previonaly only known from Sindh, has been discovered by Mr. Bext in outhern Arabia. Sararanga ainuona, Hemsley, is the name of a very extraordinary Pandanus from the Solomon Islands.

The Royal Horticultural Society.-The next meeting of the Royal Horticultural Society will be held on Tueeday, Jaly 23, in the Drill Hall, Jamen
they will be well repaid for their trouble. Among the bent varieties now in bloom are Sfaateur Montefiore, orange-bronze, edged with jellow; Paul Siegrint, rich crimson, thin jellow edge; $P$. Marquart, orange-pink aelf; Gaillame II., crimson self; Pboebus, orange-pink self; Comte Horace de Choisenl, glowing crim*on self; Alphonse Bouvier, acarlet-crimson self, very fine; Star of 1891, orangered; Antoine Barton, with red apots on yellow
and unnecessary catting of timber in the forent. "We fail to fiad," way the Committee, "juut fication for the attack that has been made; on the contrary, we ditcovered many inatances of grost exaggeration." Attached to the report are reprodactions of drawings Which appeared in one of the daily papert on May 4, purporting to reprement the atate of certain apots in the foreat on that day, together with photographs of the same spote two days later, May 6. Jadging
from these photographs, "gross exsggeration" in much too mild an expresion. Another report from the Committee of Experts is expected shortly, so that it will be well to withhold farther expressions of opinion.

THE BLACK RABPBERRY,-Specimen of thir were shown by Mr. Fabini at the latt meeting of the Royal Horticultural Suciety, and some were bindly applied to $u$, and enabled us to identify the plant as Rabus occidentalis, Linn.* The apecipa is very common in Canada and the northern Uuited Sjates, and has bean in culcivation here aicce 1696 . Mr. Farinis apecimens are the result of selection and "interbreeding," [with which species is not mentioned, but probably cronsfertilisation, not true bybridisation, is intended]. Owing to the drought, the fruits which are now about the size of marrow fat peas, are much smaller than usual. Tae canes are ncandent, rooting freely at the tipa, when in the early autumn, they bend over and touch the soil. The planta yield a prolific, but not a continuoas crop. Fraiting laterals are formed at abort intervals all along the stem. Cooked or raw, the fruit is said to be good eating, but it will have to be improved still more before it is likely to find favour with epicures uninterented in the history and evolution of fraits.

Tottenham Chrysanthemum Society. By the kind permission of Biron Schroder, the members of the above Society, to the number of fifty, paid a visit of inspection to the beantifal renidence and garden of Tne Dill, Englefield Green, on July 9. Many thanka are due to Mr. H. Ballantine and membern of the staff for kindness and courtesy in conducting the party through the extenaive range of hoases and ground and in doing all they ponibly could to make the vinit an enjoyable one. An excellent dinner and tee were provided at the "Sun Inn," Eaglefield Green. The firnt meal was preaided over by H. Hexprrson, Eiq., who proved a genial chairman. Driven were afterwards taken into the surrounding country.

Academy of Sciences.-Buron Sir Ferdinand vor Mugleer has been elected a correspondent is the botanical section.

Newcabtle and District horticultural Mutual improvement Society.- The monthly meeting of this society was held at 25 , Westgate Rond, on Tuetay, July 9, Mr. Murrax, gardener at Oakwoed, Wglam-on-Tyne, presiding at an excellent attendance of the members. Most of the evening was spent in naming apecies and varieties, and discatsing the various meritn of hardy herbaceoun plante, several collections of which were brought in by the members. Towards the close of the meeting, the members had an opportanity of viewing a facsimile of the "Magaa Charta," provided by W. Brandpond, from which the eccretary read extracta; also the warrant for the execution of Mary, Queen of Scots, and several other items of hiatoric intereat, which proved highly instractive.

National Carnation ano Picotee Society (Southern Section).-I beg leave to remind your readerr, write Mr. Jas. Dovalas, Hon. Secretary, that the annual show of the above Society will be held at the Crystal Palace on Wednesday, the 24:h inst. Upwarda of $E 150$ are offared in prizes. Amongat apecial prizes may be mentioned the Martin Sauith prizn for Border Camations; the flowers "to be cat from plants which have been wintered without protection in the open border, and staged exsetly an they are cut without dressing." The Turner Memorial Trustees give a handsome Silver Cap, value 85 , for the bent atand of twelve Carnations, biaarren, and flakes, dintinct, and twelve Picotes:
" Rubus oxidents lis, Lian.. Black Raspberry. Thimbleberry. Gooked prickles, not brietly fred, armed like the otalks with hooked prickles, not brintly ; leaflets three (rurely five), ovato,
coarely doubly serrite. whitend-dower coarmely doubly serrate. Whitened-dowry underneath, the lateral ones roseewhat atalked ; pitals shorter than the sepals; fruit parpleblaci (rarely a whitioh variety) ripe early in July. Common, especially nortli ward." Ane Gray, Mamal Bot.

diatinct-amateari only. Aoother special priza (not in the achedule of priza) will be given by Mr. Ernst Bexary, Erfurt, Germany, "The Ernat Benary Memorial Prize." A large Silver-gilt Medal ir given by the firm in memory of the late machregretted founder of the firm, Mr. Ernst Benary, for the most meritorious exbibit, either of plant or cat flowers, by an amatear.

Horticultural Club - The annual excarsion of the member and their friends, to which ladies are apecially invited, will take place on Tues. day, July 30. The member will meet at King's Crons, Great Northern Railway (Suburban), at 930 , and proceed by 9.45 train to Finchley, to view Mr. Peter Kay's graperies. Brakes will be ready to convey the party, at 115 , through Barnet to Hatfield, where the gardens, \&c., will be open to the inepection of the members, under the guidance of Mr. Nomman, the Marquia of Salisbury's neadgardener. Members will return by 845 P.M. train from Hatfield to King Cross.

Teignmouth Gardeners' Mutual ImproveMENT SOCIETY.-A party to the number of thirtysix proceeded on Taesduy, the 9 hh inst., to Bicton, the seat of the Hon. Mafk Rolle, thence to Exmonth, visiting Byatock on the retarn journey. Arrangement had been made for viewing the groves and glasshouses of Bicton, but owing to some unforeseen obstacles the party after going out of their way about a mile and waiting about 1 hoar, had to go away without having seen the object of their viait. Dinner was partaken of at Exmouth, Mr. F. Hannaf ord taking the chair, being faced by Mr. Swan, the gardener at Byatock. After a considerable amount of spechmaking, the party re-anembled, and drove to Byatock, the residence of J. P. Bryce, Enq., which lien 2 milen from Exmouth. Here they were kindly entertained by Mr. Bryce, after having inspected the various aights of the place.

Carnation Diseases.-Profemor Byron HalSTED, at the annual meeting of the American Carnation Society, indicated five disease of the Carnation:-1, Rust; 2, Laaf-apot; 3, Black-apot; 4, Ring-mould; 5, Bacterionus. Number 1 is produced by a fungus, U romyces caryophyllinus; 2 , by Septoria dianthi; 3 in not named; 4 is the Heteronporium echinulatum; 5 is caused by a bacterium. We are familar here with all these troublen, and also, quite as frequentiy, with eel-worm disease, cansed by nematode worms, which is not mentioned in Profemor Halsted's enumeration.

The Late M. Duchartre,-Professor Clos has publithed, from the Bulletin of the Botanical Society of France, his exhantive note on the life and work of this distinguished and amiable botanist. The extent and diveraity of his work as here indicated are very remarkable. His career wat one of great difficulty at first; bat he was never dircouraged, and alwaya seemed to place the intereste of acience before personal conuiderations. His work at the National Horticaltural Society of France is known to nome of our readers, and he discharged the dutien of his secretarial and editorial offise up to the day of his death. It is characteristic of the man, that when Paris was invested by the German army, Dochartas wat in the country. Hi coarse of lectures at the Sorbonne was announced to open on March 17. Eatry into Paric was, as we know, almont imponible; neverthelene, Duchartar aucceeded in gainiag entrance, and delivered his lecture as uaual ! The next day the Commune way proclaimed, but even thim did not check the Professor's sense of duty. $\mathrm{H}_{4}$ continued till hil work was stopped by ministerial decree.

Gladiolus from Offaets.-M. Chozy, wen., mentions, in the Moniteur de l'Horticulture for May 10, and on p. 112, method of maltiplying Gladioli which is little knowa. It connists in raining, under glase, Gladiolas bulbs, and, when the atems have attained a height of from 15 to 20 centimètrem (53 to 7 采inches), in cutting these off quite near the marting-point without interfering with the base,
which, after the appression of the principal atem will give birth to two, three, or even four new shoots, weaker than the first one, but which will, nevertheless, furnish bulbs to flower the following year. As to the detached shoot, it roote perfectly on a hot-bed, and by autumn forms a nice bulb of medium size. M. Crozy has, he say, practised thin mathod of maltiplication for many years, and has never had a mishap. Journal de la Sociétê Nationale d'Horticulture de France, May, 1895.

Hooker's "Icones Plantarum."-This pablication, consisting of lithographic illustration of plants, is mainly intended for systematic botaniats, bat frequently contains matter of interest to horticaltarists also. In the Jane number we find figuren of Argostemma concinnam noticeable, because it furnishes an instance of an annual plant ternainating in a solitary flower-an occarrence o rare that but few instances are known, of course excepting those which are the obvious result of defective natrition, Rhododendron Hancockii, Hemsley, t. 2381, is a native of Yunnan, and has large white funnel-shaped flowern, of such beauty that it is to be hoped it will soon be inûroduced to our gardens. Brandisia racemosa, Hemaley, a Scrophalarineous shrab, also from Yannan, with rich red flowers, is also asid to be a very desirable plant for introduction. The tame remark applies to Jasminum primalinam, Hemuley, which looks like an enlarged variety of J pudicaule. Like the preceding, it is a native of Yunnan.
"The Natural history of Plants."-Thin comprehensive work of Kerner, published in an English translation under the editorohip of Prof. F. Oliver, by Menare. Blackis \& Son, has now reached it fourteenth part. Nothing so comprehenaive has been publiahed since Lindeer's Tegetable Kingdom. Bat while classification was the leading, though by no means the exclusive feature of Lindlex's work, Kernar's biology and phyaiology take a prominent but not an exclusive position. The book is beantifully illastrated, and as a cyclopædic book of reference is excellent. Perhaps it may be found convenient to give not only an index and an analytical table of contente, but also a reference to the principal authorities on the subjects on which the book treats. At present these references aro wanting, and the stadent is no\% informed what or where is the authority for particular statementu. At the work is so much more than a mere popular exposition, auch an addition would bs acceptable.

The Weather and the Crops of 1894 -Mr. Edward Mawley's report on the "phenology" of 1894 ha been reprinted from the Journal of the Royal Meteorological Society. It will be remembered the winter of 1893-4 was not uniformly severe; the spring of 1894 was mild till the occurrence of severe frost on May 21, 22. These ruined the fruit crops excepting Pears. The sammer was generally cold, but the hay crop was good and well harvested. The autumn, as a whole, wau mild and wet; corn ripened slowly, but the field of both grain and straw was large. Oat furniahed a larger crop than any on record. Potato were below average; fruit croph an before anid, deficient, except in the case of Peart The retarnः upon which Mr. Mawley bewee his conclunions number 113, from all parts of the country. New observers are wanted in south Ireland, and in north and east Scotland.

Dr. Schlich's "Manual of Forestry"The fourth volume of this excellent treatise is written by Prof. Fisher, and is devoted to the protection of foreats against the incursions of man or hin mismanagement. A second portion is devoted to the protection of forest againt animals, birds, innectis, weeds, frosts, winds, flouds, hifoing sands, acid fumes, and the like. The work is atated to be an adaptation of Dr. Hess's work, Der Forstshetity, to the conditions and necensities of our country. The book, which is published by Messra. Brapsups, AgNew \& Co., demand a more extended notice at our hands in a future inmue.

The Summer School of Horticulture in Essex. - The School of Horticaltare, the particular of which were given in some recent numbers of the Gardeners' Chronicle, is now in full awing, fifteen acholarships having been given by the County Council of Essex. Among the various place: of interest viaited by the stadents last week was Mr. Sgabroore's yeed-farm at Chelmsford. The effect of the present drought on the size of many plants wat most marked, and Mr. Seabrooke mentioned that his William Hurst Peas which are usually some 2 feet high, were so short thim year that the pod in ripening uprooted the plant which bore them. The Godetias were also atanted, and they were intereating from the manner in which variations and the difficultien of keeping varietien trae were exemplified-matters previously noted in the case of Peas at Mr. Cullen's trial plota at Wittam. With reference to the trouble experienced in separating flower-seed from the plante which bore them, it was learned that when threshing wweet-scented Stockn, veils of many thickneases of material had to be used, as the dast given off had such a choking effect that the men feeding the machine were incapacitated in a few minates, if unprotected. This effect is probably due to the short T-meped hairs, with pointed ends, that cover the aurface of these stock. The party examined a plot of Spinach-beet in fruit which had been self-sown for mix yearm; and also an empty apace which had been planted thrice with Cabbages, only for them to fall a prey each time to the TurnipGla beetle, though generally speaking the county seeme to be fairly fres from injurious in sects just now. Mr. Seabrooke then kindly showed his collection of frait trees, and gave a good deal of valuable information to the atudents concerning some of the varietien, also dwarfing atocks. Perhap the most intereating point brought forward wan Mr. Seabrooke's method, which be had picked up in America, of taking young stocks into the hoane in wintertime, and, after grafting them in comfort by the firenide, of patting them carefully away until they could be planted out in the pring.

Another Horticulturist as Justice of the Peace, - After conferring with the LordLieutenant of the County, Lord Chancellor Heseschell, before giving up his seals of office, appointed Mr. John Wateins on the Commianion of the Peace for the County of Hereford. Mr. John Wateins in the proprietor of Pomona Farm Nurseriea, Withington, near Hereford.

Anthurium, -We have receited from M. L. De Smbt-Duvivikr, of Ghent, a serien of intereating specimens of seedling variations of A. Scherzerianum. Taking them in the order in which they come, we find:-
A. S. Rosa Rooses.-A form with a cream-coloured pathe $8 \times 4$ cent, rosy-crimson at the base, and with a amall central atripe of the eame colour.
A. S. Madame De Smet-Duvivier.-Spathe about $12 \times 9$ cento, deep orange-crimson; spadix robust orange; a very handsome variety.
A. S. var. Duvivierana.- Spathe $10 \times 6$ cent., cream-coloured; mpadix pale yellow.
A. S. var. Gandavensis.-Spathe $8 \times 5$ cent., orangecrimson; spadix slender.
A. S. var, amarantina.-Spathe $8 \times 6$ cent.; red-diah-crimnon; apadix slender.
A. S. var. atrosanguinea.-Spathe $7 \times 4$ cent., deep blood-red; spadix coral-red.
A. S. citron.-Spathe $7 \times 5$ cents, light orangecrimson; apadix citron-yellow.

Shries with Double Spathrs.
A. S. var. bispatha.-Spathe $7 \times 3$ cent, rich red crimson; the second apathe nomewhat amaller.
A. S. Prince Albert.-Spathe $6 \times 3$ cent., wecondary apathe somewhat amaller, both dull crimson.

## Serirs wite Multiple Spaties.

These are form wherein, in addition tod the primary apathe, each flower, or a large proportion of them, is
abtended by a much maller concave "spathella" (see fig. 15). These are the varietien now called "pomponate." We do not find thin word in the Latin dictionary, bat it is doabtles derived from the French "pomponner," pompon being an ornament worn on a soldier's cap. Littaítells as of arench "aying "Avoir le pompon,", which be interprets as "being in the first rank." The term pompon is applied to miniature Dablias, Chrysanthemums, \&c., bat the application of the adjectival form pomponate is new to us.
A. S. pomponatum rubrum has a reddish crimson spathe, $7 \times 4$ cent., and very numerous pathellx of the same colour.
A. S. pomponatum album bas a primary apathe, $8 \times 5$ cont., cream-coloured, with numerous apathellæ of the asme colour; padix yellow.

We are glad to see M. De Smet acting on a recommendation often made in these columna when wo have received these and other monstrous variation. Of Anthurium Scherzerianum we have now1, aimple-spathed form (normal) ; 2, duplex-apathed form with two or three apathes; 3, multiple-spathed or "pomponate" forme, with mumeroa secondary emall spathes. As to colour, there are "selfcoloured," "albino," "spotted," and "utriped" forms.

Publications Received.-Contributions to the Queensland Flora, by F. M. Barlex, F.L.S., forming Botany Bulletin, No. 10, from the Department of Agriculture, Briabane, Queenaland, May, 1895, contain numerous deacriptions of planta lately added to the flora of the colony; also, from the same department, Bulletin No. 5 (second meries), devoted to $A$ Half Century of Notes for the Guidance of Amatewr

Fruit Growers, by F.M. Bailey, F.L.S.-Erom the Cornell University Agricultaral Experiment Station, Horticaltaral Diviaion, Balletin 84 (Janary), on The Recent Apple Failures of Western New York, by L. H. Bailey.-Bulletin 86 (March), on The Spraying of Orchards, by E. G. Lodeman.-Bulletin 87 (April), The Dwarf Lima Beans, by L. H. Dybowser (Paris. Masson).-Petit Atlas de Poche des Champignons Comestibles et Vemenoux, par Padu Domír (Paris. Paul Klinsieck).-Experimental Plant Physiology, by Dr. Waltee Oey, translated by 1). T. Macdougal (Morris \& Winson, Minneapolin) - The New England Blossoms and their Inbect lisitors, by Clarence Moore Weed (Boston and New York: Hocghton, Mifflin \& C 0 ). To some of theme we mat refer on another occasion.

## MARKET GARDEN NOTES.

Mr Sharpis Strawberry Gardens at Knowle, near Virginia Water.-These gardene are famoas for their Strawberries, and well known from the fact that they are open to the public, and anyone on payment of one ahilling may eat as many as he chooner. A good many varieties are cultivated, including British Qaeen and Marguerite-the latter atanding high in the eatimation of visitors, although less firm in the flesh than other varieties. It is also Mr. Sharp' favourite variety, on account of the picking lasting longer than othern. Eugèn and Oxonian were in plendid condition on the occasion of my visit; but for excellent cropping nothing could excel Comte de Paris, the crop of which wat enormous.
There are one or two point: connected with the cultivation of the Strawberry at Knowle I would like to mention, namely, no manure hat been used for twenty years, although Strawberriea have been grown on the same ground all that time. The soil is light and sandy, which soon falle to dust in dry weather, yet at 3 inches deep it retains a good deal of moistare, even in this dry season. The plante atand 2 feet from row to row, and 18 inches apart in the row, and they are allowed to atand from five to aeven year before being renewed, and the plant notwithatanding looked healthy. Yet one could not help noticing the vigour of some Strawberry planta which had been planted on ground on which nome weed and litter had been burned, and the ashes strewed around. These patche were so conspicuous, that Mr. Sharp, jan., remarked on the way the Strawberry neem to revel in aoher and burnt refase; and aid that manare would be of ome advantage for a change, and so for the first time for twenty years they have planted a portion of the young plants on manured ground. There is one advantage which planta grown withont manure have-they do not throw many runners, and the land is not mach infested with weeds. The perfume from thene Strawberry gardens was so powerfal, you could distingaish it some handred yard before arriving *s them. \&e Bemnett, Tome, Chertrey.

## Home Correspondenoe.

ANTHRACITE COAL $v$. BOOT A8 A MANURE. -I have been waiting to wee whether any of your readers would reply to the queation under this heading, which appeared on p. 747 of the last volame, but I must have overlooked any reply, if anch has appeared. I do not quite nee how carbon qua carbon in the form of coal-duat can be of so mach ane as moot, which I take it is used not because it is mainly carbon, bat on account of ite manarial value (ammonia) for one thing, and chiefly because of its odour, which tend
to dingat many of the insect peaty, e.g., the Onion\&y. It would be intereating to learn whether carbon is manure for planta. In the form of charcoal it is, no doubt, very unefal, bat thea that is not because it is carbon, bat on account of its power of attracting oxygen, and so helping to sweeten the soil. It is worth while mentioning, however, that a patented manure, many years old, was atated to be made of stone-coal (anthracite) and sulphate of iron, and it was said in testimonials to be useful. Personally. I do not think "G. S. H." will find anthracite "daff a subutitute for soot, which in raluable in more waya than one. Saml. Ray.

In reply to the above (vol. xviio, p. 747), I do not think "G. S. H." would find "daff" of sny value as a manure, unless his land be of a stiff clayey, or light calcareons nature. In these casen the application would have a mechanical effect, opening and lightening the clayey soil so that air could pan into them roore freely; and darkening the colour of calcareons soils, which would make them warmer. Oa sandy soils it would be harminal if used. The value of "duff" sa \& manare-apart from its mechanical improvement-is not worth mention, there being only about 50 per cent. of nitrogen in an average sample, which is the only plant food it contains. The carbon is present in a mineral form and will resiat decomposition; consequently, it would be years before the nitrogen becams available for the use of plants Soot is a good manure, for besides anpplying plant food, it will improve the mechanical condition of all-except peaty-soils. The carbon in soot is present as organic matter, and can therefore readily andergo decomposition. An average sample of soot contains 4 per cent. of nitrogen, chiely present as salphate of ammonia, from 10 to 14 per cent. of alphate, carbonate, and phosphate of lime, aboat 7 per cent. of chloride of a odiam and potassiam, and 25 per cent. of silicates of lime and magnenia, all of these being mabatances required by planta in their nutrition. W. Dyke, Turnford, Herts.

CARNATION DUKE OF YORK AND OTHERB. When Mr. H. B. May eent out from Dgan's Lane Narwery this fine variety, he earned the thanks of all admirers of Carnations. When at ite beat the colour may be deacribed at a brilliant shaded crimson, large, full, and finely formed; a good grower, which does not plit its calyx. It wants but one more quality, that of fragrance, and then it would be perfect. In respect of the possession of this quality, the maroon-coloured Uriah Pike han a great advantage over it, and probably the latter is rather more free in blooming. Bat both are invaluable to any one who grows for catting parposen. When are we to have a fragrant yellow eelf? I have never yet met with one that posseased fragrance. It may be coming, but it doen not appear to have made iteelf known as yet. Germania would be perfect an a yellowself had it the clovescent of Uriah Pike. It in sometimes said that Gormania is not a good grower, but I recently aw at the Roysl Nursery, Sloagh, e number of two-year-old plants in pote, large in vize, vigoroas and free branching in growth, and remarkably free. Mr. Harry Tarner said mach finer fowert could be cut from auch two-year-old planta than from yearling ones. $R$. $D$.

CHOICE HARDY RHODODENDRONB.-It in a pity that Mewirs. Anthony Waterer \& Son of the Woking Narneries did not anme some at least of the newer varietie they exhibited at the Drill Hall on June 11. Some of them, and especially the delicately-tinted pink and pale rose varioties, have yellow and orange blotches and spotting on the upper eegmenta, which of late years have become conaiderably deepened in colour. One of the mont atriking of this sype is Mra. Prjce Lade, blumh or delicate pink, with a central buach of rony atamena, aad orange blotch and markings on the apper regments. Lady Grimeton is almo very fine, and a good grower; it is faked with carmine on a pale ground, and hae atriking top petals. A. B. Mitford is a large and finely-formed deep bright rosy-crimion variety, with dark spots on the upper segmente. One of the mot striking is picturatum, pink thaded with rome, the apper segments marked with large dark blotches, giving it the appearance of a Pelargonimm. Some of the unnamed needlings are also of fine character. Ro, Ealing.

EAFLY PEAB.-I have read with interent the aotes on early Peak by "A. H.," in your ianue of the 13th inst. To gardeners, the new firt early wrinkled varietion of Pene are of great value, being of superior flavoar to those Peas which have round seeds. I have grown mont of the wrinkled Peas, and find that

Harbinger, a variety sent out by Dicssone, Chester last vear, to be saperior to any other that I know of it being quite as early Exonian; and although the pods are not of such a deep green colour as that variety, they are larger. which is a valuable point in an early Pea, and the Pass are of excellent flavour The variety Gradus is a valuable second early wrinkled Pea, and when groweri can depend upon getting it true to name, it will become a general avourite. The introduction of these fine Peas should lead to the extinction of inferior varieties. $M, G$,

PYRAMIDAL SWEET CHERRY TREE8.-It is aeldom that awet Cherries are grown as pyramid in private gardene, a fact probably due to the unastisactory way in which they fruit, and to their liability to saffer from gumming. In gardens where wall space is abandant, and a western aspect can be devoted to these fruits, traly fine crops are obtained annually, and pyramida are not needed; but where wall space is not at hand, other method have to bi adopted for the production of sweet Cherries, and to my thinking, the pyramid seems the right sort of tree. It is, however, evident that the let-alone method will not do, and something more is needed than simply proning and dressing to bring the trees into good fruiting. There exista in a garden not far from Maidatone a very fine lot of well-grown trees, which for the past four or more years have produced exceptionally heavy crops of large luscioun fruit. The trees in question are planted moderately close together, so that in the froiting eason a wooden framework is easily placed over them, and over these some fish netting. This keepl the bird from the fruit. These trees are growing on the Mahaleb and Cherry-atock, and they are moderately pruned annually, so as to prevent a too free growth of the shoots. At these pranings some of the atronger roots are severed at a distance of 3 feet, measured from the atem, and as a consequence there is a man of healthy fleshy roots at a ahort distance around the atema. Daring the growing season the young shootn are constantly piached to assist in the formation of froit-buds, \&ec., so that both at top and bottom the trees are much restricted-a practice some gardeners might regard as too severe. However that may be, a better and more fraitfal lot of trees could not be wished for than thees; and the pinching and root-praning will be persiated in ao long as the tree bear as freelp a at present. Of the early varieties I map mention Frogmore Bigarrean, Early Riverp, Black Eagle, Kentish Bigarreau, Napoleon Bigarrean, and Elton; later ripening ones are Fiorence, Bedford Prolific, Black, and Tartarian. All of the Dake Cherries are well demerving attention of the gardener. H. Markham.

TOMATOB NOT BWELLING OFF.-The caute of Nareeryman's" Tomato fruits not swelling, is either owing to imperfect fertilination of the bloome, or to the plants, at an earlier stage, having received s check. As the frait is welling well farther up the stem, and if there in plenty of light between the plants, and thene are vigorous, I would advise the removal of all, or a large proportion, of the lower leave of the plants, encouraging a shoot to grow from the base. This would soon olothe the bare stam, and if the variety is a free-setting one, fruit would in due course put in an appearance. This thoot could be stopped after showing three or four trusies. A similar case came under my notice a fer days siace, when visiting a friend' Tomatohouses ; and, in this case, the plante were planted prior to the continued frout in February. The aite is very low, and the woil, being cold, checked the proper extention of the roots ; while the topm, being in a well-heated house, had, at the time, apparently not noffered. At present, the root mut be active indeed, as evinced by the vigorous shoots above, and a good crop will doubtless enaue. $P$. $F_{\text {. }}$ Le Sueur, Grand Vale, Jersey, July 13.

ARAUCARIA IMBRICATA,-On the terrace-garden opposite the south front of Alderbury Vicarage, Salisbury, is growing a remarkably good specimen of the Chili Pine (Araucaris imbricata). It was only 9 inches high when planted by the Rev. Canon Hatchinge' gardener in 1851, now it is about 40 feet high, straight, and of handsome outline, and having a tem $3 \frac{1}{2}$ feet in circumference a few inches from the green sward, which is bruwhed by its branches. And when I say that the tree is bearing about thirtyfive large flowers newr the top, readers of the Gardeners Chromicle will anderatand that it is in robust health, though one or two of the branche clone to the ground thow alight signa of diatressprobably caused by the combined influence of the
anasually dry aummer of 1893, and the pqually exceptionally severe frosta experienced in January and Febraary lant, followed by the prevailing tropical weather of the last eight or ten weeks. Canon Hatchings, however, il of opinion that the distren referred to is owing to the fact of the roots having penetrated the sandy sub-soil-the natural sarface oil being light, inclining to peat. This circamstance reminds me of an avenue of fairly good axamples of Aracaria imbricata which I saw eeven or eight year: ago at Branksome Dean Park, Lord Wimborne's place at B Jurnemouth, which were then exhibiting proofs of declining vigoar, and the nataral soil and ab-soil at Alderbary Vicarage and Brank some Dean Park are, judging by appearancev, vary mach alike. This being so, what practical inference are we to arrive at other than that the Chili Pine delights in a soil inclining to be peaty rather than otherwise, and which is well drained, and that to long as the roots are retained in this, and the tree being protected from the effects of north and eant winds, so long will it make aatisfactory growth. H. W. Ward.

VINE PERONOBPORA.-I send you a few mildewed Vine leaver and immature Grapes of the kind known as San Gioveto (the best quality used in making Chianti), as it may interest you to see the progrem of the diseave, and the effect of the Bordeaux Mixture apon it. They came from the podere attached to this villa, in which the Vines have been carefally medicated every year with the above mixture, since it introduction as a remedy. Nevertheless, this year the mildew made its appearance with the opening of the leaves quite early in May, and although the remedy has been applied three timos already, and in doses of more than doable the usual strength (that iv, 2 kilogrammes instead of 1 of aulphate of copper to a quintal of water), the disease is by no means subdued. Of the four leaves ment, the topmost is one which opened early in the season, received its done, and is cured. In the second one, the disease has been permanently arrested, but has not disappeared. The third leaf has been twice medicated, but the diseave is atill spreading. The fourth is a leaf of recent growth which has not yet been treated, which the fungus has attacked with extreme weverity, and which would certainly wither. The effect on the fruit is ach as I had not hitherto reen. As a rule the disease han appeared with ut much later in the season, and its effect has been to prevent the Grapes maturing, leaving them light in colour and acid to the tante. Owing, I appose, to the extreme humidity of the year, ap to the end of Jane, the disease began early, with the result on the Grapes that you see. The Vinns presented a grew promise of fruit, but at least half of it did not flower, rotted at the stem, and withered. Thousands of fine bunches have gone that Way even in this well-tended vineyard. My neighbour who have been lens careful in this and previoun years, have no fruit left at all. The Bordeanz Mizture proven itself to be a palliative of this ever jet appeared, I think, but far from being the complete care too often claimed for it. That has yet to be dircovered, and if it be not, the art of Vine-growing an a profitable industry may aome day be as extinct an the Dodo. Thomas C. Hayllar, Florence.

MONA'S PRIDE POTATO.-My experience with Mona'a Pride has not been a very favourable oule, and I have grown it three yers in all sorts of wayl. Bettor onea are an follow:-Star of Roading, which wan sent to me for trial two years nince, is a nicelooking taber, early, a good cooker, and an abundant cropper. We have found fifty tubers at one root, the average number being thirty, an extraordinary number for sach a small plant; the height of the haulm in about 1 foot. Myatt'a Ashleaf is very good on our land. Daniela' Table King is a good variety, and I almaya cultivate a good lot of it, as it comed in to well after the above, and before white Beanty of Hebron. It is a good taber, and mach to be proferred to the pink variety, with the exception of white Beanty of Hebron. The others are all dug ap, and done early. They were planted on March 12 , and we begar to dig them on May 26. I have aboul, twenty more varieties, mont of them new for trisl, which I hope to report upon in a few
G. Howes, Merton Hall Gardens, Thetford.

THE ROUNO LEAFED BUNDEW,-It may not be generally known that the roand-leafed Sandow (Dromera rotuadifolia) occure in the greatent pros. fuiton near the wource of Brony Buro, Callen, Banf-
shire. The exaet locality is 300 feet above sea level, on a atrip of bog-land, alongaide of the plantation between Barnsford, and the line of the march that divides the parishes of Deskford and Rathven. At the present time, the bright-red leaven of this intereating carnivorous plant appear in their greateat beanty. W. Kelly, Aberdeen.

PAULOWNIA IMPERIALIS.-Thi noble tree, like many other natives of warmer countrie than our own, has felt the severity of the past winter. I examined the other day a fine tree fifty years old, which is in full leaf, but bearing no flowers. In other years it han flowered profusely on the naked wood before the leaves appeared. The flowers are of a dark violet hue, borne freely, and about the size and shape of a Foxglove, and a well-flowered example makes a atriking ob.ject; the leaves being of large size and apread out horizontally, make it a fine shade tree. Paulownias are often recommended for town planting, bat one seldom meets with them in England; on the continent, however-in Pariv, for instance-they are plentifully planted. A. Hope.

## A PROLIFEROUS POLYPODIUM.

Ma. G. B. Wollaston, of Chielehurat, hanvery kindly aent mea frond of Polypodium vulgare var. elegantiesima (fig. 16), upon which the development of the rare phenomenon of aral bulbils appeara remarkably profusely. Herewith I mend you an enlarged aketch of a pinna ( $X$ about 3 ), ahowing how the cluters of bulbilis are developed in lieu of aporangia, which, except in an aborted atate I have been unable to trace. At first aight, and before the little fronda appear, the abnormal sori appear exactly like the aposporous growth which have been recorded on A. fof. Clarimima, but in this case the next step in the direct formation of fronds instead of prothalli, and from the ready growth of these when laid down in congenial soil, I have no doubt whatever that proper axis of growth will follow, and independent planta reault. The Polypody family, due, probably, to the proviaion for eavy extenvion of habitat through the creeping rhizonce to which it owe it generic name, is very rarely balbiferous, and this instance merits record on that groand alone, apart from the interesting tranaformation of reproductive energy which it represents. It appears to be identical in character with the soral bulbile noted in Adiantam capillus-veneris vars, daphnites and imbricata, already recorded in your columne, while the soral bulbile noted in the species Athyrium differ in being usually solitary and accompanied by numbers of perfect sporangia to which they seem to bear no analogy, i.e., they make their appearance as bulbila proper and quite distinct in character from the asoosiated growth. Chas. T, Druery, F.L.S., 25, Windsor Road, Forest Gate.

## SOCIETIES.

## IHE LONDON PANEY AND VIOLA.

Jour 6.-There was a great demand upon the available npace of the Crystal Palace on the above date, and the London Pansy Society's show had to be content with a vite immediately in front of the orcheatra, but in a position favourable to showing off the flowers to the best advantage. An at Birmingbam, the fancy Panaiea in the open clasm and the leading flowers in the amrteura' division came mainly from the North, and they were, on the whole, remarkably good deapite the prevailing drought. Show Pansies came entirely from the Nortb, and were an ual somewhat limited. Violas in fretty epray were very numerous, and in these clannes the Southern growers held their own with considerable credit to themelves.

Open Collections.
Open cluises. - There was but one collection of Pansies and Violas, Mr. S. PYe, Gaterall, Gazstang, winning the Gold Medal of the Society with a superb exhibit, having twelve boards of fancy Pansies, twenty-four blooms in each, and four panela, each containing forty sprays of Violas, all prettily and effectively arranged. Among the fancy Pansies were fine examples of Mrs. J. Travis, W. H. Clarke, Lord Hamilton, Mrs. R. G. Moir, Miss Stirling, Mrs. D. Jobnstone, Miss Abercrombie, J. Crawford, W. Stewart, M. Bain, J. Samuel, J. McFarlane, G. H. Clarke, Mrs. R. Tleming. Mrs. Markie, Tamwarth Xellow, Mra. D. MreNeill, Mry Kay, Mrs. G.

Paddie, T. Gardener, John McLellen, T. C. Hedderwick, Miss Pattersou, Tom Graham, John Myles, Jessie Travis, Maggie Burn, J. Robertson, and Dr. Bostock-a very fine selection for anyone needing one. The sprays of Violas were representative Grandee. King of Whites, Christiana, Mrs White Flag, Grandee. King of Whites, Christiana, Mrs. D. Ferguson, Lemon Queen, Geo. Lord, Gold Crest, Lord Elcho, Yellow King, Wonder, Ardwell Gem, Blue Gown, Waterloo, Sweet
Lavtnder, Crimson King, Commodore, Iona, Charmer, Mrs Lavender, Crimson King, Commodore, Iona, Charmer, Mrs.
Wood, CCuntess of Kintore, Maggie Todd, Mrs. Crane, Duchess of Rothesay, \&c.
Fancy Pansies. - There were five stands of forty-eight fancy Pansies, Mr. J. Sutherland, Lenzie, N.B., being placed 1st, with clean, fresh, bright blooms of Col. J. S. Stirling. Mrs. W. Watson, Miss Stirling。Magkie Mc Phail, Jas. Irvine, Miss Patterzon, Taraworth Yellow. Mrs. Fleming, Mrs. Sherrard, Marmion, Goorge Stuart, W. H. Clark, Bernard Doulton, rard, Marmion, George Stuart, W. H. Clark, Bernard Doulton,
Mrs, M. Cuthbertbon, Dr. G. McKay, Jessie Russell, Celtic Gem, Mahogany, Jenny Lawson, and Princess May, as the very finest; 2nd, Mr. M. Campbell, Blantyre, N.B.
There were five collections of twenty-four varieties, Mr. A. Lister, Rothesay, N.B.. being placed 1st.
With twelve blooms, Mr. J. Smellie was 1st, having the following in fine condition:-Mahogany, W. H. Clark, Mrs. W. Steel, Ella Murray, Marmion (a beautiful soft flower), and Maggie Watson; Mr. J. LISTER was 2nd.
The best twelve of any one variety were those of Marmion, from Mr. J. Smeille; Mr. A. Lister coming 2nd, with Col. R. G. Buchanan.

The best twelve unnamed seedlings came from Mr. $\mathbf{\Lambda}$. Lieter; and Mr. J. Smellie being 2nd.

Fig. 16.-1 proliferous polypodium.

Show Pansies, -Mr. J. Smelure had the best twelve varietiee, viz.:-Dari selfs: J. T. Howard, and a seedling: yellow setfs: Maggie Benson and Mrs. John Hunter; white selfs: Bobbie Harper and a seedling; yellow grounds: R. M. Wembey. Busby Gem, and John Brand; white grounds: Mrs. Wilson, Mrs. Brown, and Jessie Thompson, Mr. J. IISTER was 2nd ; his leading flowers were-dark selfs: Harry Paul and R. Mcallister; yellow self: Willie Irvine; white ground : Mra, John Stewart; white self: Bobbie Harper; yellow ground: Mrs. John Hunter.

## Amsteurs' Difision.

Fancy Pansies.-With twelve varieties. Mr. J. McFarlane, Glasgow, was 2nd, having Maggie McPhail. Annie Knowler, Mrs. D. Johnstone, and Mrso W. Watson, very fine. Mr. Thos. Nades, Alvestan, was 2 nd. With six varieties the same exhibitars were severally lst and 2nd.
The best twelve Fancy Paniles of one variety were thoee of Tamworth Yellow, from Mr. NADEW: Mr. MCF $\angle$ RLANE was 2nd with Maggie MePhail.

## Open Classes.

Violas.-Various stands were employed for exhibiting sprays of Violas, but all were Licely and effectively displayed, though we thought some of the flowers over-large. The best twenty. four eprays, six blcoms in a spray, came from Mr. J. SMELLEE. With twelve eprays, Mears. Pavi \& Co. were let. With air varieties of raylees Violas, Mr. A. J. Rowberry. South Woodford, was 1st, with cham ming sprays of A. J. Rowberry, deep yellow, Bluah Queen, Christiana, Border Witch, Vestal, and Blue Gem; 2nd, Mr. W. Baxt\&R, Wohing, with some capital sprays.
With aix sprays of the miniature type, Mr. A. J. Rowberary was agaiu 1st, having Marginata, Violetta, Olivetta, Emily, and two seedlings ; Mr. J. Nichorsor was 2nd.

IVolas, Anateur Classes. - with twelve sprays, six blooms in a spray, Mr. H. A. Needs, Woking, was placed 1st, having charming illustrations of Lemon Queen, Duchess of Fife, Iona, Ardwell Gem, Admiration, \&c.; Mr. A. J. Rowbrriy way
2nd. With gix aprays, Mr. E.C. Smith, Muswell Hill, took 2nd. With sir sprays, Mr. E.C. Smith, Muswell Hill, took
the 1st prize ; and Me. W. Bucking. Chingford, the 2nd. In the lst prize; and Mr. W. Buckrva. Chingford, the 2nd. In
a few other small classes the exhibitora already named were a few other small clas
The best fancy Pansy in the open classes was Grorge Stewart, shown by Mr. J. SuTherland, Lenzie: that in the amateurs' classes Mr. David Johnstone, from Mr. J. McFaridne. The best gpray of Viola in the open clesees was Florizel, deep lilac, shown by Mr. S. PYE; the best in the amateurg' classes, Christiana, pure white, with yellow eye, from Mr. H. A. Needs.

A large collection of Violes, not for compotition, was ataged by Messrs. Dobbie \& Co. It consisted of eome 200 sprayo comprising 130 varieties, and thoroughly representative of the bost, new and old. Sweet Peas were also included, and a
good strain of Auriculaered 8 weat good atrain of Auricula-eged $\$$ weet William.

## IPSWICH HORTICULTURAL.

Jolr 9.-This Society got back to its old home in Chriatcharch Pak, on the occarion of the lat show The Pask with all its fine Spaniab Cheatnuts and other trees has now become the property of the town, and is open to the pablic frep, with the right to close it for twelve day in the course of the year for furposes approved of by the Corporation. It is popalar, and has been used to sach purpose that the grass is literally trodden off by thounands of basy feet over mont of its area. It was suggested to some of the authorities that baving, we underatood, liberally and well-spent some $£ 60,000$ on this open apace for Ipawich, they might connect it with the town mains, and keep the tarf alive and green during periods of drought, by frequent overhead watering. Even the fine trees looked less green and ahady than asual.
The show this year in the old home, however, had very substantial merit, though neither to large nor so good as we have often seen under the fostering auspices of this Society. The most notable reductions were among Roses, which was doubtless largely attributed to the great Rose show of the Royal Horticultural Society at the Drill Hall, London, on the same day, and Rose shows in other places, as well as to the drought. But in the main the show of Roses resolved itsel into a contest between two amateurs and two nurserymenthe Rev. Hugh Berners and the Rev. A. Foster-Melliar, and Mr. Frank Cant and Messrs. Prior \& Sons, of Colchester. The Silver Medal of the National Roee Society for the best Rose in the show was won by the latter with a fine bloom of Francoit Michelon, though it was ron pretty close by a very freeh though rather sraall A. K. Williams, and the bett of this charming half dozen, Gabrielle Luizet, staged by Mr. Berners, In the class for thirty-six Roses, Mesars. Frank Cant was 1ut, and Mesers. Prior \& Sons 2nd. For twelve Roses, three trusees of each, Messrs. Prior were 1st, and Mr. F. Cant 2nd truses of each, Messrs. Prior were 1st, and Mr. F. Cant 2nd.
Theee were among the sicheat features of the show. For twelve Teas and Noisettes, Mr. Frank Cant was lat, and Mesers. Prior 2nd. For twenty-lour Rooes, distinct (Amateurs), 1st. Rev. A. Poster-Melliar, Sproughton; 2no, Richard Berners, Harlstead. For six Roses, throe trumes of each (Amateupe), 1st, Mr. Foster-Meiliar ; 3nd, Mr. Berners. Twelve Roses distinct. single trusees, 1st, M. D. W^RMER, Eeq. Twelve Tea aud Noisette Roses, 1et, Rev. HUGh Bernerm. Six Roses of one variety (Amateurs), ist, Mr. Bernirs, wath a charming six of Maasme Gabrielle Luizet. Four Roses, single trassep, giown by residents in the borcugh (Amateurs), 1et, Mr.CC RDER. Six Tea and Nci ette Roses (Amateurs), ist, Mr. W. Passong. A charming bow of l'Idéale from Mr. Mr. W. Past, were brilliant, beautiful, but indescribable-in ite blending of metallic red and gold-added greatly to the effect. We noticed the following of the beot blooms among the Rowes. Rruest Metz, Madame Hoste. The Bride, Niphetos, Souvenir de Paul Nejron, Francisca Kruger, Anna Olivier, Innocente Pirola, Comtesse de Nadaillac, Edith Giffard, Souvenir d'un Ami, Maréchal Niel, Jean Ducher, Ethel Brownlow, Catherine Mermet, Alba rosea, Madame Cusin, By brid Perpetuals, Reynolds Hole, Mre. John Laing, Charles Lefebvre, Viscountess Folkestone, Madame Victor Verdier, Charles Darwin, John Stuart Mill, Horace Vernet. Ducherse de Morny, Marie Baumann, Dr. Powell. Duke of Fifé, Madame Charles Crapilet, Harrison Weir, Suzanne-Marie Rodocanachi, A. K. Williams, Alfred Colomb, Jean Soupert, Camille Bernardin, Heinrich Schultheiss, Duke of Welliapton, Her Majesty, Eclair, Madame Verdier, Marie Rady. Lady May Fitzwilliam, Xavier Olibo, La France, Star of Walthara, Ulrich Brunger, Jeannie Dickson, Duchese of Bedford, Du. hess of Edinburgh, Duke of Edinburgt, Marchionees of Londonderry, Duke of Teuk, Gustavo Piganneau, Exhibition de Brie. La Havre, \&c.
The Table Decorations, and Bridal and Ballroom Deoorations deseave to rank next to the Roses; there were three of the former 8 feet by 5 , having this peculiarity, that they were all furniohed and judged by ladies. Two of them, that of Miss Gilbert and that cf Miss C. G. Orpen, were harmonies of Sweet Peas of ulique lightness, chasteness, and beauty; and they were so nearly alike in merit, that they were rightly bracketed equal lst. The Teas were lightly veneered with Asparagus, Maidenhair Fern, and a delicate spray or two of white Jasmine, and Ficus repens. Mr. STEWARD, who was 3rd, showed what may be called a harmony of Shirley Poppies and Nasturtiums, on a jellow ceatre, also very lightly touched with graceful foliage.

Herocecous Perenniath - As usual, there was a grand muster \& cut herbaceons flowers for collections, most tastefully arranged on a table-space of 8 feet by 3 , and aloo for the beet twenty-lour, twelve, and dix herbecoous plants, these made a rich dioplay. The chief prized being taken by Mr. Jac'obi of Heniey Rood, the Earl of Dysart, Mr. Georie gilerert, Meam. WARYER and Notcutt, Req. W. Beqwerts, Rev, E. Firrex, captain Price, the Hoo. I. Lowther.

## Miscezlaneous Exifbits

A few good stand of Pelargoniums were also shown, but like the Fuch ias, all far below the standard of former jears, Groupe of plants arranged for effeot were very crejitably shown, three exbibitom ahowing in each of the two sections of 12 feet by 5 feet for smatnars, and 9 feet by 4 feet for ditto, omploying not mope than one gardezer.

## Vegetables.

The Ipewich Borticultural Society still holds a high place as vegetable show of the first rank, and the liberal apecial prizee offered by Mesams. Sutton \& Sans, Wills \& Sons, Daniels Brothern, Mr. W. Addison, and the apecial collections fon seedmaen, an well an the liberal prizes offered by the Gociety, brought a splendid muster of vegetables in moot of the clases. The green Peas were green indeed. Potatos, espesially the Duke of York and Sutton's Seedling, looked perfect:

Duke, however, neems to sport in many gradations, from
veritable Ashion! to the furtheat remove from those ceuliar marks and swelliggo on its surface that distinguigh all true Ashleal Potatos. All the Dukes present, however, were linked together throagh those peculiar unique spots that diotinguish that Ane Potato. Carrots and Cauliflowers were also fine. Broad Beans seem getting bigger, longer, broader. Turnipy were the ouly vegetables preest that seemed as if they might have folt the pinch of the drought. Cucumbers and Tommtos fine, also Lettuces Cow , and especially Cabbage Lettuces, the latter enpecially wonderfully goud; while Cabbages were conspicuous by their absance-no, there was one lot of three.

Eruit.
Fruit, erpecially Grnpee, Nectarines, Melons, Peaches, Cherries, black and white Strawberries, were fiae; and there were eight dishes of Baspberries, eeven of ripe Gooseberriep, nine of other sorts, seven of black Carrants, twelve of white Currante, thirteen of red Currants, nearly the whole reing of high quality. There was a fine lot of Strawberries in all shown, in collections and in single disbes, and for weight, Laxton's Lateat of All taling 1st and 2nd prizes for weight, the third was unnamed, lat. thirty frults, weighed $\% \mathrm{lb}$. 1\% 06. ; 2nd, thirty fruits, weighed 21b. 专 02.; 3nd, thiry fruite, weigtred 11 lb .7 on. A very fine dish of the etriking black Strawberry Waterloo whe shown, though by no means up to the Queen standard in flavour, this strawberry is better in quality than not a fow, and ite colour will afford a new variety in desserte that bave to be large and showy as well as good. Of black Grapes there were seven lote of good quality, and only three lots of white, not specially good. Then also there were collections of fruits of siz dishes each-Mr. Messenger, gr, to C. H. Berners. Eaq., of Woolverston Manor, taking the 1st prize with Black Hamburgh, Buckland Sweetwater, Bellagarde Peaches, Pineapple Nectarines, Beat of All Melors, Waterloo Strawberry, the Strawberries nicely managed in a series of sereral tints, pasily accessible and well arranged under the personal euperiatendence of the Rev. H. Berners; the able trekary, assisted by Messra. Mahon, Smith and Hooper.

## THE WOLVERHAMPI ON FLORAL FETE.

JuZy 9, 10, AND 11.-This wae one of the beat horticultaral exhibitions yet witneased at Wolverhampton. Favoured by beautiful weather, the show was greatly patronised on the first day. The prizes offered were sofficiently tempting to retch exhibitore from all parts of the tingdom, and the show of plante bat never been excelled at Wolverhampton. Some of the chief featares of the show were the Rones, which were remarkable for to dry a neason, more than 3000 bloome being rtaged, and the groupe arranged for effect.

## Cut Flowens.

Herbaceous Pl mits. - Of these there was a large display. A novel clas, and one which was much commended by the juiges and public, was that for the National Challenge Prizethe most taste? ally arrangerl Violas and Pansies ic glaeoes, with Viola or other suitable foliage as a setting. A Gold Medal and substantial money prizes were also offered by PavL. Lutz, Baqe, to encourage an improvement in the staging of these flowers, and altogether there were eight competivors. It whan clase that was the mont admired of any, and aerved to show the decorative value of Violas and Pansies in slifful hands. It was remsrked that the naual mode of setting ap them flowera as spraye was not adhered to.

## gtove and Greentouse Plants.

## For the beat suxtesn Flowering or fine Fotiage Plints, no

 frwer than cight to be bloom, Orchids exeluded: Int, Mr. J Cypher, Cheltenham, with a collection that containes wellbloomed Allamada grandiflora and A. Headermoni, fine ape clmeas of Anthurium Scherserianum, Bougainvillea glabre, Imora Williamsi, and L. regina, Erica Kingatoniana, Co diapum angustifolium, a very fine C. Mortefoatainense, Cycas circinalis, Letanis bortocica, and Kentia australio. J. MysRIoTT, Esq., Coventry, was 2nd (gro, Mr. Finch), with Statice profusa, well flowered; also Inoras. Bougainvillea glabra, and sone good Codimums.
the beit six Exotic Ferns, H. Lovatt, Req., Bushbury (gr., Mr. Sharp), was lst with a very fine Todea superba, Dicksonia antarctica, Gleichenia Mendeli, \&c. 2nd, J. A Kemprick, Esq., of Edgbaston.
For six Extic Orchids, 1st, Mr. J. CyPher with Cattleys Sanderiana, C. Mendeli, and Odontoglossum Alexandre 2nd, Mr. Charleswortig.

Fur Six Palms, Dissimilar.-1st, Mr. J. CxpHer, who etaged a good Latania borbonica, Kentia Forteriana, and Phoenix reclinata: 2nd, Mr. VAUSE, Leamington, with Areca lutescens, Kentia australis, and Phooniz dactylifera.

Group of Plants.-1st, Mr. J. CYPEER, with a group con sisting of Humea elegans, Palms, Orchids interspersed with well-coloured Codiæums and Ferns; 2nd, J. Marriott, Feq of Coventry, with a group containing plants of Gypsophila, Orchids, Carnations, Ferns, Palms, Codiæums, all very nicely arranged; 3xd, Messrs. TOM B. DoBBS \& Co. of Wolverhampton, whose group was effectively arranged with Lilies. B
vardias, Orchids, and Palms, the plants clean, well grown.

## THe Ophis Classes.

Roses.-For seventy-two distinct varieties.-1st, Mr. B. R. Cant, Colchester, who scaged superb blooms of Her Majesty, Alfned Colomb, Innocente Pirola, Marchioness of Londonderry, and Maurice Bernarjin: 2nd, Messrs. Lowe, of Wolverhampton a Son Kinget, Wolverhampton; and Mr. J. H. Wrient, Worcester.

## TUNBRIDGE WELLS <br> HORTICUL TURAL

Jons 10. - The thirty-seventh annual exhibition was held on the above date, and in rempect to quality and quantity was well up to the average. Groups are alwaye a strong feature, and on this occasion competition wan very close. Eventually, Mr. J. Howes, gr. to W. Cobs, Esq., Taubridge Wells, wa placed before Mr. L. Dapond, gr. to C. B. Powril, Esq.; Mr. S. Pope, gr. to J. J. Barrow, Esq., following. There was little to choose between thene groups, all three being enpecially neat and pretty in arrangement
For four stove and greenhouse plants, Mr. T. Portnell, RR. O Sir A. Lamb, Battle, was 1st, Statice profusa, Clerodendrom Balfourians, Dipladenis amabilis, and D. boliviensis being very well flowered. Mr. S. Pope, gr. to J. J. Barrow, Freq., on for
four ornarenental-foliaged plants; and was also lit for four four ornamen
exotic Ferne.
In a clase for nine Orchide, Mr. J. Howes was a good 1st, his pieces of Epidendrum vitellinum majus and Oncidiam macranthum being excellent.
Begonias were excellent, Mr. W. H. Wichews being lst for singles, and Mr. T. Furze for doubles. Mr. W. H. Wickers also won the Silver Medal for tuberous Begonias, with a grand lot.
As usual, both zonal Pelargoniums and Fuchaias were good, while the Gloxinias were difficult to beat. Mr. WICKEMS, Mr. Wakeford, and Mr. Furze took lst honours in the order given, for these three species of plants.
Cut Flowers.-For blooms of herbaceous plants, Mr. J. Chartyon, Tunbridge Wells, was well in front, and put upa grand lot. Mr. Dupont, gr. to C. B. Powell, Esq., Southborough, was 2nd. Mr. T. Portnell was lst for eighteen varieties of stove and greenhouse flowers. Table decorations if not very numerous, were of the usual high quality, Mrs Hatton, Sevenoaks, being list for three stands; and Mr. s. EDW IRDS, Sevenoaks, Ist for one stand, the latter decorated entirely with Roses. In both classes, Mr. A. Hatton, gr. to Mrs. Swanzy, Sevenoaks, was a close 2nd. Mr. J. Chariton woo for a wreath, hand-bouquet, and also a wedding-bouquet, all being good.
Roses.-Mr. G. Mount, Canterbury, was well in front for forty-ejght varieties, and had some good examples. The best were Duke of Teck, Duke of Wellington, A. K. Williams Charles Lefebvre, Marie Baumann, Xavier Olibo, and Dupay Jamain. The last bloom secured the National Rose Society's Bronze Medal for the best Rose in open classes, and was a magnificent flower. A similar Medal in the amateur clasges was awarded to Mr. Elmes for Mrs. Joha Laing. Mr. J. DenNETT, Maresfield, won for twelve Teas or Noisettes. Mr Harris, gr. to E. M Bethune, Esq., Denne Park, Horsham, staged a good stand of twenty-four single blooms, Niphetos, Alfred Colomb, A. K. Williams, and Fisher Holmes, being particularly good; Mr. C. salter, gr. to T. B. HAYwood, Esq., Reigate, was a close 2nd here, and first for sir varietien, three of each; while Mr. Harris was again well in front for twelve Teas in the amateur division with a perfect stand.
Fruit.-This was excellent in quality. Mr. J. Friend, gro to the Hon. P. C. GLyN, Godstone, beat Mr. PaLMER for Black Hamburgh; Mr. EARL was in front of Mr. J. Snow for Black Grapes other than Hamburgh; while Mr. Snow was well in front for White Grapes. Mr. T. C. Moorhouse, gr. to J. W. TEMPLE, Esq., Groombridge, took 1st, both for Panchee and Nectarines; Mr. Earl doing the same for Pine-apples and Cherries, and Mr. Friend for Melons and Strawbarries.
The collections of truit (nine varieties) were good, and resulted in Mr. Fennell, gr. to W. M. Cazalet, Eqq.. Tonbridge, being awarded an equal lot with Mr. EARL, Mr. J. Snow following.
Vegetables.-Mf. J. Friend was 1st for nine kinds, and also for sir kinds, to be grown by single-handed gardeners only. The ist prize in Mesars. Suttor a Sov's class went to Mr. G. Denton, gr. to A. G. Earle, Eaq , Tonbridge ; and that by Mr. J. Cearleon to Mr. C. F. Dunk, gr. to H. Taylo Eeq., Rusthall.
The chief winners in the local classes were Mr. J. Syow for sir stove and greenhouse plants in bloom, also for foor ditto for ornamental foliaged plants and for exotic Ferns.
Miscellconeous,- Oottagers productions were particulady good, empecially the vegetables. A fow good cat Rooes ass: from Mr. G. W. Piphes, of the Uckfield Nursery; and aloo pretty group of Begonias and Ferns from Mr. S. S. CULins Juhn's Narseries. Other exbibits, not for competition, wern implements.

## EDDINBURGE BOTANICAL.

Jour 11. -This society held it last meeting of the sesaion on the abrve date, in the Lecture Hill of the $R$ yal Botanic Garden, Mr. Sjmington Grieve taking the chair.
There was a rather thin attendance of members, this beiph due to the heavy rainfall during the afternoon. After the reading of the crupcil procsedings, and election of arw members, Mr. Andrew Tajlor read obituary notices of Dis H. C. F. Cleghorn and Dr. T. A. G. Ballour, both of whom were distinguibbed members of this society, and contributore to the Transactions of the soclety. Mr. R. Lindsay, Cursoms is his report on Vegetation in the Royal Botanic Garres. atated that a much lerger number of plants had flowered upon the rock garden than for everal years in the corresponding
month. The foliage of trees were tolerably free from insect pests, notwithstanding the drought during the month. The following items are taken from the report of moteorological observations for June, in the garden. The highest reading of the barometer was on the 24 th $=30^{\circ} .397$; lowest, $29^{\circ} .445$; mean for month, $29^{\circ} 965$. Protected self-registering thermometers: higheat reading. $77^{\circ} \cdot 7$, on the 26 th ; lowest, $37^{\circ} \cdot 1$, on the 13th; mean for month, $56^{\circ} 3$; or $0^{\circ .7}$ above averace for June of last four years. Hygrometer: mean of dry bulb, $57^{\circ} .8$; mean of wet bulb, $52^{\circ} \cdot 5$. Radiation thermometer: highest, in mean of wet bulb, $52^{\circ} 5$. Radiation thermometer: highest, in
suv, $131^{\circ} 0$, on the 10 th: lowest, on grass, $28^{\circ} \cdot 8$, on the 15 th. suv, $131^{\circ} 0$, on the 10 th : lowest, on grass, $28^{\circ} \cdot 8$, on the 15 th.
Frost occurred on grass on six days. Total sunshine, 187 bours Frost occurred on grass on six days. Total sunshine, 187 hours
23 minutes; the sunniest day was on the 6th, when 13 hours 23 minutes; the sunniest day was on the 6th, when 13 hours total fall being 20560 inch, this being 0.611 inch above the average for June of last four years. Mr. R. L. Harrow read the asaal notes on Plants in the Plant Houses, and exhibited Combretum purpareum, Crinum augustum, Cypripedium Parishii, Lambertia formose, Tusnaccia pulchells, and others from the houses. At the close of the meeting, the chairman announced the next meeting to take place in November.

BATE ROSE AND BEGONIA SHOW.
Julv 11.-The Bath Rowe ahow, as unual, was held in the Sydney Gardens on the above-named date. The competition in some of the open clanses was not quite $n 0$ good as it generally is at Bath, the long apell of dry weather being reaponaible for this circumatance; the blooms, however, were of a high order, and the thow was a succens.

## ROSES.

## Nursertmen.

In the class for seventy-two distinct varieties, three very good Jots of blooms were staged by Mesars. HARKNESS \& Sons. Bedale, Yorkshire; Mesprs. Perkins \& Sons, Coventry ; and Messrs. George Cooling \& Sons, Bath, who took the prizes in the above order. The contest for lst place between the Yorkshire and Warwickshire firms was very close. best blioms in the premier stand were Captain Haward. He Majesty, Duke of Teck Trancisa Kruger, Gustave Pigard, He Mrs. John Laing, Prince Arthur, Alfred Colomb, A. K. Williams, Comte Raimbaud, Auguste Rigotard, Victor Hugo, Earl of Dufferin, Marie Rady, Charles Darwiu, Exposition de Brie, and La France. The blooms in the 2nd prize stand were slightly smaller, but they were even, fresh, and of fine sub stance, as also were the blooms in Mesars. Coolings' stand
Thirty-six varieties, three trusses of each.-1st, Messrs Coolme \& Sons, with good all-round blooms of Comtesse de Nadaillac, Pride of Waltham, Etienne Levet, Alfred Colomb, Xavier Olibo, Mrs. John Laing, La France, Abel Carridre, Caroline Wood, Gustave Piganneau, Duke of Wellington, blooms of richer, Horace Vernet, Harrison Weir, large eolid blooms of rich velvety crimson, \&c.; Messrs. PERims taking and honours with a good stand.
Eighteen distinct varieties, three trusses of each.-Mr. Grorar Mount, Canterbury, was a good list among four competitor with a granà lot of blooms; Mr. JoHN Matiock, Oxford, as 2nd.
Thirty-six distinct varieties, single trusses.-Here Mr. Mount was to the front again with a fine lot of blooms, including grand specimens of A. K. Williams, Mrs. John Laing, Duke of Edinburgh, Madame Eugene Verdier, Xavier Olibo, Ulrich Brunner, John Mills, and Alfred Colomb; Messrs. Cuntis, AINDFORD \& Co. were 2nd.
Eighteen Teas or Noisettes, distinct varieties, single trusses. First. Mr. Mattock, with a stand of even, freeh, solid blooms Ernest Metz, Souvenir de S. A. Prince, Caroline Kuster Catherine Mermet, Madame Cusin The Bride Conese Nadaillac, Innocente Pirola. Marie Van Houtte, Maréchal Niel, Suvenir d'Elise Vardon, Ethel Brownlow, and Souvenir de Thérèse Levet; Mesurli. Curtis, Sandford \& Co. were 2nd.

## Amateurs.

In the clases for thirty-six and eighteen varieties in single trusses, the Rev. J. H. Pembertor, Havering, Essex, secured premier position, Duke of Teck, Her Majesty, Charlea Lafebvre, A. K, Williams, John Stuart Mill, Dupay Jamain, Catherine Mermet, Dule of Wellington, and Comte Raim baud, being the most prominent blooms in hia stand; Dr. BUDD Bath, was a good Ind in each class.
Twenty-four varieties, ringle trusses.-1at, Mr. THomas Hobbs, Bristol; 2nd, Mr. Parker, Old Feadington, both staging good blooms.
Twelve varieties, one bloom of eack, -Mr. HonBs was again 1st, and Mr. ConWay Jowry, Gloucester, was 2nd.
Local Classes. - In the two classes reserved for Roses grown within aix miles of the Guildhall, Bath, Mr. A. Hill Grax. Was lat in both, securing the Gold Medal for twelve varieties, one bloom of each, and premier place for a like number of varieties in trebles. Mesars. F. G. Garaway, Hobss, and Ball (Bath), were the other prize winners in the aborementioned clasees. Mr. Hinl Gay alco secured the premier award in two out of the three clases for Teas and Noisettes; Mr. James Parker taling and place in the other clas.

## Ofer Clusses.

Twelve singig trusses of any Rose.-lat, Moserv. Hisirntes a Sons, with good examples of Guitave Piganneau; Iud, Meeers. Cuntis, 8andFond \& Co., with mood olocms of Marte Bau-
mann. fis atands were seaged in this clacs.
Troulve blooms of any Yel ovo Rose.-let, Mr. Jons Mutrook,
with faultlese blooms of Comtesee de Nadaillac; Mr. Hild Gray being 2nd with Maréchal Niel.
Twelve single trusses of any crimson Rose.-1st, Messrs, Perikins \& Sons, with mrand blooms of A. K. Williams ; Mr Mount taking 2nd place with good solid flowers of Fieher Holmes.

Tw lve distinct gardon decorative Roses to be shown in bunches.-Here Messrs. Georgr Cooling \& Sons were easily let with grand exhibits of Ophirie, Madame Falcot, Jaune Desprey, Celine Forestier, Marquis of Salisbury, Beauté Inconstante, W. A. Richardson, Bardon Job, Homer, Triomphe des Rennes, and L'Tdéale: Mr. Mattock was 2nd.
Premier blooms. - Mr. Hill Gray had the best Tea or Noisetta (Comtesse de Nadaillac) Rose in the show; and Mesers. Harknrss \& Sons had the best hybrid perpetual in Gustave Piganneau
Messrs. Keynes Williams \& Co, Salisbary, had a stand of hybrid Sweet Briars, which were greatly admired; Jeannie Deans, Breada, and Lucy Bertram being the most conspicuous.

## Groups.

For a group of miscellaneous plants, on a space not exceed ing 250 square feet, Mr. JAMES CYPHER was 1st, with an artistic arrangement, consisting of a series of mounds having central plants of Palms, Bamboos, Tuberoses, Dracæna Goldjeana and Lindeni, Crotons, and Humea elegans in fine flower, backed up by grandly-flowered Orchids; also Caladiums, Maidenhair Fern, Crotons, \&c. Mr. B. R. Cater (Chairman of the Bath Floral Fâte and Band Committee, and a keen horticulturist) was a capital 2nd, being very strong in Orchids ; and Eldorado cork was introduced into this arrange ment with good effect, representing the front eleration of castle.

## BEGONIAB.

Four classes were set apart for plants of the tuberous-rooted Begonias, and the plants put up in competition for these prizes made a good show, and were, on the whole, highly creditable to the growers. The plants were confined to pots not exceeding 10 inches in diameter.
Mr. Richard Curry, Bath, was lat for six distinct varieties, with well-grown plants, the foliage being good, and the flowers large and fresh; Mr. T. W. DUNr, Bath, was 2nd.
For six plants, double, Mr. J. B. BLACKMOOR was 1st, with large, grandly-flowered plants of Lady Gertrude, Duchess of Fife, Rev. E. Lascelies, Princess May (a fine white), Mrs. French, and Exquisite; 2nd, Mr. D. L. Carr.
Mr. DUNN had the best specimen, single-flowered ; and Mr Blackmore the best plant of a double variety.
Mr. B. R. Davis, Yeovil, had a magnificent display of cut blooms of great size, and various and pleasing shades of colour.

## STRAWBERRIES,

In the three clastes provided for Strawborries, Mr. F. Bicketse, Batheaston, took lst prize in each class, showing nice fruits of Sir Joeeph Paxton in each case.

## Vegetables

Two good collections of vegetables were staged by Mr. George Garaway and Mr. Wimilam Evby, who secured the prizes in the above order.
A portion of the side staging on entering the large marquee had been devoted to the sale of spare flowers in aid of the Gardeners' Royal Benevolent Institution, $£ 13$ being realised in this way last year. This prictice is worthy of adoption by the committees of other shows held in various parts of the country.

## THE NATIONAL ROSE SHOW AT DERBY.

Joly 17.-We share the opinion of both secretaries, that this ahow was the best of the neason, so far as quality is concerned, while it certainly fell very little short in numbers. Not many expected to find so grand a collection of Roser after the prolonged drought, but there they were, and from almont all parta, but Scotland, Ireland, and the north and north - east of England sent the best flowers. The Hybrid Perpetual were very good, clean, and bright, except in a few casen; but the Teas were ncarcely mo pood an at the Cryatal Palace or Gloucester. Their uniform good quality was remarkable, more enpecially in the Hybrid Perpetual classes.

## Nurseatymen.

Is the Jubilee Trophy class for thirty-six singles, to which a Gold Medal is also awarded, there were eleven competitors. Messrs. R. Harkwess \& Sons, Bedale, Yorks, won with a good stand, consisting of Charles Lefebrre, Madame Faglae Verdier, Horace Vernet, §.-M. Rodocanachi, Dr. Andry, Duchesee de Morny, Dupuy Jamain, Queen of Queens, Comte Raimbaud, Her Majesty. Duke of Edinburgh, Gustave Piganneau, Lady Mary Fitzwilliam, Fisher Holmes, A. K. Williams (medal bloom), se. There was scarcely a faulty bloom in the colleotion. Mr. B. B. Cant, Colchester, with a good lot, was 2nd, his beat bloomy being Lady H. Stewart, A. K, Williame, Victor Eugo. Horace Vernet, and Duke of Wellington. Victor Eugo, Horace Vernet, and Duke of Wellington.
Mesers. A. Dickson \& Sons, Newtownards, Ireland, had two promising seedlings in their 3rd prize atand.

For seventy two distinct, single trusses.-Mesors, Hulwness \& Sons, B. R. Oant, and Measrs. Diorson \& Bow occupiod the same positions as in the former clas. The beat flowers in the winning Etand were Etiense Levet, Marie Eumaan, Horsce Vernet, Duke of Connaught, Prine Arthur, A. K. Willians, and Victor Hugo.

For thirty-six varieties, three blooms of ach, there was very keen competition, but eventually Mesars. Hakrweas, B. R. CANT, and Mesars. Dicsson once more followed each other as named. A eet of their new H.P. Merrie Eagland, was peculiarly striking in the winning stand.
Thirty-six sing'es, distinct. - There were nine collections, and the prizes were taken by Mesars. Cocker \& Sons, Aberdeen: Mesars. D. PRIOR \& Son, Oolchester, and Mesars. Very shortls after Worcester, in the order of their names. ere For of kesers Cocker's stand.
For eighteen virieties, three blooms of each, Mesars. D. Paion \& Son, Colchester, were well ahead, Mesars. To WMNEMD and Mr. G. Mount following.

## Silyer Medal Roses.

Nurserymen. - Messrs. Halkmess 80w. with A. K. Williams (H.P.): Meart, W. \& D. CmoLi, with Marie van Houtte (Tea).

Amateurs

The Jubilee Trophy and Gold Medal was won by Mr. E. B. LINDSELL, Hitchin, who also secured the Silver Medals for both the beet H. P. and Tee Rose shown by amatears. This was a grand stand, the Medal blooms being Xavier Olibo and Comtesse de Nadsillac; Madame Hoste was the only weak flower. H. V. Macein, Req., Gateford Hill, Work*op, had Horace Vernet and Her Majesty particnlarly good in his 2nd prize stand.
A£10 Cup, presented by the Bight Hon. Sir W. V. HarCOURT, was easily secured by Mr. E. B. LindsELI, with good collection of thirty-sir blooms; MP. W. Drew, Ledbury, was 2ad. Mr. E. B. Lindsell was also lot for eight distinct varieties, three blooms of each; Mr. H. V. Macein dividing him from the Rev, J. H. Pemberton in this class.
The Crown Derby Vase, for growers of fewer than $20 c 0$ plants, was secured by Mr. J. PAREER, Oldfield, Hitchín; E. MAWLEY, Esq., Berkhamsted, 2nd; and R. E. WEST, Esq., Reigate, following.
For growers of fewer than 1000 plants, Mr. WHITTLE, 56, Belgrave Terrace, Leicester, was in front.
4 piecs of Plategiven by the Mayor of Derby was won by Mr. A. Weriton, Bedale. Yorks, for twenty-lour distinct singles.

Nine single b:00ms, T. TıTHAM, Esq., Wilmslow, was a good lst among seven competitors; Mr. J. T. MARSDEN, Silverdale, Carnforth, winning for sim Teas. Theee three last classes were for growers north of the Trent only.
For nine blooms of any one variety, except Teas or Noisettes, Mr. Maceir was succesalul with Prince Arthur; Mr. Drew, with Mrs. J. Laing ; and Rev. J. H. Pemberton, with A. K. Williams.
The ciass for six mew Roses was poor; Mr. Macmrs and the Rev. J. H. Pemberton being respectively lot and Ind.

## Teas and Noisettes.

Eight competed in an open clase for Lwelve trebles, Mesurn. D. Prior \& Son, Colchester; Mr. J. Matrock, Oxford; and Mears, Cocker 8ons, Aberdeen, winning in the order as named.

## Nubserymen.

Mesurs. Phion \& Sox were 1st for eightsen distinct, singles; Messrs. A. Diokson \& Son, Newtownarde, Ireland, 2nd; and Mesars. J. Cocker \& SONs, Aberdeen, 3rd. This was a strong lass, and the winners came from a wide area. In thin anss Was the silver Modal Ton, Van Houtte, from Messor. W. W. D.
For tweloe Teas, Mr. J. Marrock, Oxlord, was Iat: Mesart. J. Burnell \& Co., Cambridge, being 2ad.

## AMLTEURS.

Twalve biooms, distiwet, open to all amateurs.-Mr. O. Q. ORPEv, Olcheatar, was well in front of A. Huh Grir, Eeq. Deth.

Nine blooms of any Tea or Noisette,-Mr. Mschin, Workwop won in this clase, atagiog some good blooms of Edith Gifford.
Nine single blooms by growers of fower thas 500 plantis. - Mr. W. Drew, Uplands, Ledbury, was list; A. H. Grax, Eeq., Bath, beiog let for an extra class of siz varieties, three of each. Bath, ${ }^{\text {mer }}$ R Burrgide, Sutton-on-the-Hill, was 18t, with Marie Van Houtte for six bloome of eny Tea.

## Opeir Classez

Twelre new and distinct Roses.-Mesars. A. Dickson \& Sons, Newtownards, Lreland, won with a good lot, but a little Nowter chan at the Crystal Palece; Mr. B. R. Cant, Colcheoter,
and 3rd.
A Gold Medal was this time a warded to Menation Dre giren \& Soxs, for H.P. Helen Keller, and Commendation was given for Lady Moyra Beauclerc. Mesers. TownsHewd \& SON, W Or cester, won with The Bride, for twelve blooms of any white
Boee. Meesry. A. Drcrson \& Sown, with Her Majeaty for twelve bloome of any light Rone (a grand box); and Memars. Harknkse \& Sons, with A. K. Williams, for twelve blooms of any crimson Rose.

Garden Roses.
These were very good, and superior to those shown either at the Crystal Palace or Gloucester. In the amateurs' clave for twelve bunchee, Mr. H. V. Machix was 1st
Messrs. Pauz at SOX, Chenhuat, teiged agrand lot in the open clase for 1st honours; being followed by Mesars. W. \& D Croll, and Mesars. J. COCRER \& Bos.
In the dieplay of Rose, Mr. H. V. Macmir beat Mr. J. Mattook.

## Gbituard.

John Wille.-On Satarday, the 13th inat., on a perfect summer day, with the brilliant annshine playing about the grave in Brompton cemetery, and amid a large circle of friende from all parts of the conntry, John Wills, whose death was annonnced in our last iasue, wat laid to reat. Many who would otherwise have been present were kept away by basinens engagemente pecaliar to the day; but it was a representative gathering which atood around his last resting-place. He had diaplayed undoubted genius, and marked originality in his particular line; he had conceived and carried into effect achievementa which amounted almost to audacity, but alwaye execated with remarkable taate, akill, and conscientious attention to details, No man in his day has done no much to elaborate and elevate the art of the floral decorator, and the immense impetue given to the development of that art in later years is largely due to the happy inspirations of him who sleeps his last sleep in Brompton Cemetery, near others of his brethren who in their day had made hortieultare famoan.

Jobn Wills was born in 1832, at Chard, Somernet, where his early life was apent. He received his education in the village school, having as a achoolmate Mr. Saperintendent E. Denning, wo long the Chief of the Police at Buckingham Palace and the Houses of Parliament, and who was present at his funeral. Oa leaving school, he was taken into the gardena of Cricket St. Thomae, the aeat of Viscount Bridport, near Chard; and from thence he went to London about 1850, as gardener near the Swiss Cottage, St. John's Wood, to a Mr. Woodcock, who was father to the vicar of Chard. Later on he was employed ander Sir J. Paxton in laying-out the grounds of the Cryatal Palace at Sydenham; and from thence he went to the Pine-apple Narseries of Mesirs. A. Henderson \& Co ., Maida Vale, and on leaving there to the gardens of the Royal Horticaltaral Society at South Kensington, under Mr. George Efles. He next became engaged as gardener to Sir Philip Grey de Egerton, Bart., at Oalton Park, Tarporley, where hit enterpriaing spirit found congenial work. It is to him we owe to some extent the popularity of the Viola as a bedding plant in the preaent day, by his bringing V. cornata to the fore and getting it a place in almost every flower garden. This led to others, expecially in Scotland, tarning their attention to the Viola, V. Inten and other apecies being employed for the parpone of obtaining new races for garden decoration. Willa also paid mach attention to the Verbena, and raised nome donble verieties now probably lost. He also originated some very fine and distinct bicolor Pelargoniums, including Beaaty of Calderdale, Beanty of Ribbleadale, Beanty of Oulton, Her Mrjenty, Golden Queen, Gaiety, \&cc., and of tricolore, Florence, Lizzie, and Unique, which were sent out by Mr. William Ball ; the former of theere, Beanty of Calderdale, is atill grown for bedding parposes. In 1865, he was gardener to Capt. Le G. N. Starkie at Huntroyde Park, Barnieg, where bo atill continued his experimente is raising new varieties of bronze zonals and other bedding Pelargoniama; and from whence originated the new ard distinct Ivr-leaved varieties Willaii and Wilhii rosea. To the Botanical Congress held in connection with the Great International Exbibition of London in 1866, he contributed a paper on the aporting of "Pelargoniume and other Plante," which is publithed in the Report of Proceedings; and later he contribated to the gardening press papara on the origin of variegated Pelargoniams and sallied subjects. Coming to London at the end of the sixties, he eventaally eatablished himself in businens at Sassex Place, Brompton, removige a fow years aftermard to Onslow Crencent, where he bailt up a large businees, having establishmente at Anerley, Fulham, and elsewhere; and taking a foremont place as a floral decorator. Early in 1880, fiading his large basinens beyond his coatrol, he formed it into Limited Liability $\mathrm{C}_{0}$, with commodions preminee in Regent Street; but it did not prove so succenful as he had hoped, and the bueinese again
found the centre at Onalow Crescent, one of his manager, Mr. S. M. Segar, becoming a partner, and here he died.
When the Royal Aquarium, at Westminster, was first ontablished some jears ago, Mr. Wills planted the summer and winter gardena, and had the maintenance of them for a time; and he also carried out a meries of horticultural exhibitions in the bailding, at one of which, held in May, the sum of $£ 100$ was offered in three prizes for twenty-five Orchids. He alao carried out a large exhibition at Sandown Park, which attracted a very fashionable company. Hir groups of plants at the leading London exhibitiona were always remarkable for the taste and akill which characterised his work.
About 1878 he was superintending extensive alterations at Laeken Palace for the King of the Belgians; and during his career he undertook extenaive floral decorations at Backingham Palace, Marlborough Honse (where he had charge of the gardent), at the Foreign and other Government offices on the occaaion of receptions, at banquets, at the Mansion House and other city halla, at many aristocratic mansions, \&c. One of his greatest undertakings was the decoration of the Midlend Railway Station, and the Queen's Hotel, at Sheffield, on the occasion of the visit of their R.H. the Prince and Princess of Wales, who were present at the opening of one of the pablic parks, when he electrified the Sheffeld folk with the boldness and originality of his work. His proposal to cover the Albert Memorial in Konsington Garden with a gigantic glans erection, and make it illustrative of the flora of the four quartera of the globe, will be remembered; ea also his energetic efforts for a number of years to originate another International Horticaltaral Exhibition in London.
Many gardening Iastitations and Societies found in him a generous supporter. At the time of his death he was a member of the committee of the Royal Gardenera' Orphan Fund, and as long as he was able to do so, he made a point of attending the meetings of that body. He leaven a widow, who will continue to carry on the basiness in Onslow Crescent, in conjanction with Mr. S. M. Segar. R. D.

Mr. J. Stratford.-We regret to announce the death of Mr. J. Stratford on Jane 29, aged sixty-one years. He was head gardener at Wormley Bary, Broxboarne, Hertfordshire, for thirtyfive yeara, ander the late Mrs. Grant and H. G. Bushby, Eeq ; having come from The Knole, Glamorganshire, with Mrs. Grant in the year 1860. The faneral took place at Wormley Charch, on July 3, a large number of his old friend attending; and he leaves a widow, three daughters and one son, to mourn his loas. Mr. D. R. Stratford, son of the deceased, takes his father's place as head gardener, he having been foreman under him for the past five yearn.

## Market 8 .

COVENT GARDEN, July 18.
(We cannot accopt any reepponibility for the aubjoined reports. They are farnished to us regularly overy Thursday, by the hiadneas of several of the principal for the quotations. It must be remembared that thense quotations do not represent the prices on ans particular quotations do not represent the prices on any particular the date of our report. The prices depend upon the auality of the samples. the supply in the market, and the demand; and they may fluctuate, not only from day to day. but often meveral times in one day. Enly

 foreign supplies, prices are lower. J. B. Thomas.

## SEEDS

London: Ju'y 17.-Mezars. John Shaw \& Sons, Seed Merchants, of Great Maze Pond, Borough, London, S.E., Merchanta, of Great Maze Pond, Borough, London,
write that owing to the Parliamentary elections, and more particularly to the practically unbrolzen drought, to-day's seed marlet was bare alike of buyers and of business. Now Trifolium, both English and French, being in early and abundant supply, and well in advance of consumptive want, naturally comes to hand very cheap. There is no change in either Mustard or Rape-seed. Canary exhibits marked signs of increasing strength, the bear sales which caused the receat depression are apparently still uncovered. Peas and Haricots leep steady.

## FRUITS AND VEGETABLES.

Borover: July 16.-quotations:-Carrots, 2s, to 2s. od per bag; Peas, 2s. 6d. to 3s. 6d. per bushel; Horseradish, 1s. to 18. 3d. per bundle: Apples, Tasmanian, 6s. to 88. per case ; Cherries, 1 s . 6 d . to 2 s 。; Currants, 1 s .9 d . to 43 . per half sieve.
Spitalifields: July 16.-Quotations:-Cabbages, 5s. to 7\%. per tally; Carrots, $2 s$ o to $2 s$ odd. per dozen bunches; Turnips, do. ; Peas, 2s. $8 d$. to $3 s$ s. per bushel, and 5s. to 6s. per byg; Broad Beane, 2s. 6d. to 3s. per bag; Scarlet Runners, 3s. to 3s. 6d. per half-bushel; French Beans, do.
Stratyond: July 16.-The supply at this market daring the past week has been excellent, and, with plenty of buyers, a brisk trade was done at the following quotations:-Cabbagen 2s. 6 d . to 5 s . per tally; Peas, 5 s . to 6 s. per bag; Beapl, 2s. $9 d$. to $3 s$. per bag; Black Currants, 3s. 6d. to 48. per dis sieve; red do.e 3 s . to 3 z .8 bd . do, ; Chesies, 48 . to $4 \mathrm{~s} .6 \mathrm{~d}_{\mathrm{o}} \mathrm{do}$. do., eativg, 4s. to 5s. तo.; Apples, 2s. 6d. to 2s. 9 d . do. ; do, 58. to 5s. 6 d . per sieve; Oranges, 4s. to 5s. per 100 ; Tomatoe, 88. to 10 s . per case ; Beanf, Scarlet, 7s. 6d. to 8s. per busbel; Cucumbars, 28 s. to 2 s . 6 d . per dozen; Turnips, 28 . to $28,6 \mathrm{~d}$. per dozen bunches: Carrots, hourehold, 1 s , to 2 s . per dozen Mangels, $12 s$. to 20s, per ton; Onione, Egyptian, 5s. 6d, to of per cwt.
Farringdon: Jw'y 18, - Quotations:-Raspberries, 3d. to 4d. per 1 b . ; Gooseberries, 2 zs . "d. to $3 s$. per half-sieve; blact Currants, 5s. 6d. per half-bu!bel; red do, bs. per bushel ; Green Gagea, 5s. Bd. per basket ( 12 lb ) ; 'Cherries, 6 s . pes half-bushel ; do., white, 5s. Bd. do. : Melons, 12s. per case of 24 ; Pine apples, 2s. 6d. each ; Apples, Tasmanian, 6s. per 24 ; Pine apples, 2s. $8 d$. each; Apples, Tasmania,
case ; Tomatos, English, $6 d$. per lb. ; do., foreign, 1 1 d. per 1 lb ; Cucumbers, 2d. each ; Cabbage. 18. 3d. per dozen; Parley. Cucumbers, 2d. each; Cabbage. 18. 3d. per dozen; Pa. Broad
$6 d$. per bunch; Turnips, $2 d$. do ; Carrots, $3 d$ do. pallo Beans, 2s. to 2s. 6d. per bushel ; French do., 68. 6d. per ballbushel ; Scarlet Beans, 6s. 6d. do,

## HAY.

Averctget.-The following sov the averages of the pricm at the principal metropolitan markets durina the past weeli: Clover, prime, 908 . to 115 s . : do., inferior, 503 , to 80 m ; hay, best, 60s. to 95 s. ; do., inferior, 30 s . to 60 s . ; unixture. 7us, to 98s.; and straw, 20s. to 40s. per lowd.

## CORN.

Averages. - Official statemant of the average price of British Corn, imperial measure (qr.), for the week oudin July 13, and for the corresponding period in the previout July 13, and for the corresponding period in the prev, 740

## POTATOS

Bonovar: July 16. -Quotations: Old, 40s. to 60s. per ton: New. 80s. to 130s. per ton.
SPITALFIELDS: July 16. - Quotations:-Hebrons, 80s. to 100s. ; Puritans, 90 s. to $100 \mathrm{~s}_{0}$; Snowdrops, $80 \mathrm{~s}_{\text {. }}$ to $100 \mathrm{~s}_{\mathrm{s}}$; Kidneys. 100s, to 180s. per ton.
Stratcord: July 16.-Quotations: - Old : 25s, to 40s. per ton. New: Beauty of Hebron, 80s. to 90 s. ; Kidneys, 90s. to 100s.; White Hebron, 85s. to 90s. per ton.
Farringdon: Ju'y 18.-Quotations:- Now: White Hebrons, 5s. to 5s. $8 d$. per cwt. ; Red do., 4s. 6d. to 5s. do. ; Early Monarch, 5s. to 6s. ; Puritans, do.: Jersey, 48 o to 58 per cwt.
Lomdon Averages: July 17.-New: Hebrone, 808, to 100 s. Snowdrope, 80s. to 100s. ; Early Regents, 80 s . to 90 s. ; Early Rose, 75s. to 85 s . ; Jersey, 70s. to 908. ; Cherbourg, 65s. to 75s. per ton Old : Magnums, 30s. to 40s. per ton

The term "accumulated temperature" indicates the aggre gate amount, as well as the duration, of degrees of named : and this or below $42^{\circ}$ Fahr. for the period degrees-a "Day-degree" signifying 10 continued for an inversely proportional number number of degreen for an inversely proportional number of hours.

The distriots indicated by number in the first oolumn are 0 Scotland,
 10, Iroland, 8.: ©hannel Islanda.

## THIPASTWETK

THe following summary record of the weather throughout the British Islands for the week ending July 13, is furnished from the Meteorological Office :-
${ }^{4}$ The weather was unsettled and rainy in the extreme western and northern parte of the kingdom, but generally fair in all other localities, althongh some rain was experienced in nearly all places on Thuraday or Friday.
of the period buture was rather high during the earlier days of the period, but fell considerably towards its close, and the average for the week did not differ materially from the normal value. The highest of the maxima were recorded either on the 7 th or 8 th, and rangel from $80^{\circ}$ to $82^{\circ}$ over the greater part of Ragland, to $72^{\circ}$ in Ireland, and to $71^{\circ}$ in the north and west of Scotland. The loweat of the minims were recorded, as a rule, during the latter part of the week, and ranged from $41^{\circ}$ in 'England, N. and E. ${ }^{\prime}$, $42^{\circ}$ in 'England, S.W.', and $43^{\circ}$ in 'England, E.', to $51^{\circ}$ in the 'Channel Islands.'
"The rainfall exceeded the mean in 'Scotland, N. and W." and also in "Ireland, N.', and juet equalled it in ' England, N. W.; but in all other diatricts there was again a deficiency "The bright sunshine was in exceas over the defciepcy England, as well as in 'Scotiand, E.': but in Ireland and the Weat and north of Scotland, the amount but in Iretand and the the mean for the time of year. The percentere of the poesibl duration ranged from 62 in "England, 8." and 61 in the 'Mus land Counties, and from 'England, $\mathbf{S}^{\prime}$ ', and 61 in the "MıdRoglish dietricts, from between 46 and 59 in the other

## To a Minor bard.

Poat, who long hast tuned thy song
In praise of Roses and of Lilies,
And wreathed each line with Eglantine
To please the lovely Amaryllis,
The taste in flowers those lines embody Is jast a little bit démode.
If thou wouldet write for our delight
(And that of her whom thou adorest),
No longer wait, but celebrate
The latent triumphs of the florist:
Why obstinately shat thine eyes
'To horticultural novelties?
They flant themeelves on hot-house shelver, With petala apangled, twisted, forked :-

## Sarely the Mase will not refane

To recognise the modern Orchid!
Should gazing on their glorien tire thee,
Their names alone mast need inspire thee.
How aweet, my friend, to seize and spend The wealth these noble namen supply us;To sing of Masdevallias

Of Zygopetalum, and Phaius,
And, seeking for a rhyme to " blonom,"
To find it in "Odontoglossum"!
Then there's Cymbidium and Oncidium, Lycaste with the parple lip,
Calanthe, too, of gorgeous hue.
Then haste!-The vacant laureatenhip(I're shown the way)-'tis thine to win it, So set to work this very minute -Pall Mall Gazette

## ENQUIRY.

"He that questioneth much shall hearn much."-Bicox.
Britier Wines. - "C. H. I," withes for some receipts for making wine from Carrante, Rapberrien, Gooneberries, and Plums.

** Owing to the large imerease in our circulation, we ar veluctantly under the neccessity of goine to press some hours eartier. Our contributors, who vell know what this impliess, wia week as possible. Communications should reach us not later tha Wednesday.
** Plants, Fruits, etc., to be Named.-Corraspondents demanding time and research for nameir soiution asking question to obtain an answer to their encutrites in the current week Specimens should be good ones, carrefully pocked and numbered and not more than six should be sent at one time. Leaves only, of Florists varieties cannot, as a rule, be named.
Annoals for Standing the Winter: $W$ Agrostemma co'i-roses fimbriata, 是font; Aly sam maritimum, $\frac{3}{3}$ foot; Bartonia aurea, $1 \frac{1}{2}$ foot Cacalia coccinea, 1 foot; Calliopais Drummondi, 2 feet; C. coronata, 1 foot; Candytuft, whits, lilac, and criman, 1 foot; Chryanathemam Barridgeanum, $1 \frac{1}{2}$ foot; Clarkia elegant, in varie $y$, $1 \frac{1}{2}$ foot; Collinsis, in variety, 1 foot; Erysimum Peroffokianam, $1 \frac{1}{2}$ foot ; Eschscholtzia californica, 1 foot; Gilia, in variety, $1 \frac{1}{z}$ foot; Leptosiphon densillorus, 1 foot; L. aureas, 咅 foot; Lapinue nanue and others, $\frac{3}{4}$ to $2 \frac{1}{3}$ feet; Nemophila varieties, $\frac{3}{4}$ foot; Shirley, Orientel, and Iceland Poppien; Sanvitalia procumbens, $\frac{1}{2}$ foot; Silene pendula, $\frac{3}{4}$ foot; Sweet Peas, 5 feet; Venus Looking.giasa, $\frac{3}{4}$ foot; Virginian Stock, in variety, ${ }_{4}{ }^{3}$ foot. The above is an ample lint for any but jarge gardens, and contain many very pretty plants. To make quite sure of having a diaplay, it is pradent to make sowings in Septamber in mall 60 -pote, and thin the eedlings to five or six in a pot. They should be wintered in cold pits or banked-up frames clowe to the glass, and protected from hard fronte, and well aired at of her times. These may be planted out in Marcb.
Booss: C. M. T. The Landscape Gurdener, by Jon. Newton, published by Hurdwick \& Bogup, 192, Piccadilly. Milner'n Landscape Gardewing, pab-
lished by Simpkin, Maruhall, Kent \& Co., Stationera' Hall Court, London, E.C. - F. C. Heinemann, Erfurt. The American Florist Company's Directory. Price, 2 dollarn. Chicagn: Published by the American Florista' Co. It containa list of Florists, Narserymen, and Seedmen in the United States of America, benidea other asefal matter.
Carnation Failing to Bloom: J. H. Cansed by over-watering, probably. There is no disease risible.
Cabnations: J. A. The appearances are probably due to the presence of eel-worms. They are derived from the oil, so that they are difficult to get rid of.
Chrysanthemom Buds: $X$. The crown-bud is the terminal bud of the main stem, and therefore is really the terminal bud proper. The terminal bud of the Cbrysanthemum fanciers is the terminal bud of the ide-shoots. It might be called necondary terminal bud to avoid confusion, the proper terminal bud being called the primary terminal.
Eucharis: $W$. J. They are affected by the bulbmite, and there being no cure for the malady, you had better barn all the affected bulba and make a new atart with clean plants.
Grapes: R. $D_{i}, L_{0}$. The apote are due to a funga figured in the Gardeners' Chronicle, July 21, 1894. Spraying with Bordeara Mixture in the very young state would be serviceable.
Namis of Plants: Correspondents not answered in this issue are requested to consult the next number. S. 1, Leptospermuco ericoides; 2, Spirms orbifolis: 3. Eryngium alpinum ; 4, Hierochloe redolens: 5. Lilinm monadelphum ; 6, Centaurea acabiosa. -C. H. I. 1, Ls chnir chalcedonica; 2, Galega officinalis; 3, Justicia carnea; 4, Altbæa officinalis; 5, Clarkia elegane; 6, Stenactir ape-ciona.-W. Over. Cattleya granulosa, var. Dubasymonii. - $X$ 1, Pyrus Sorbaz, the true Service; 2, Spiræa callona.-E. J. N. $\mathbf{A}$ very good variety of Stanhopea oculata - W. M. Dendrobiam superbiens.-M. 1, Mgrsiphyllum asparagoides, often called Smilax; 2, Phyllanthan nivonus; 3, Cyrtomium (Aspidium) falcatum, a cold greenhouse or conservatory Fern; 4, Lastrea arintata variegata.-G. M., France, The flowert of Epidendrum were quite dried up on arrival, but they appear to be of the variable E. fragrans. The abnormal flower is very ain-gular.-W. V. T. Guevinia avellana, Proteacege, figured in the Gardeners' Chronicle, Julp 12, 1884. p. 41.-H. Henkel. Dondrobium gratiotiatimam, the other probably Palox macalata var. candida. - Amateur. Lavatera trimestris.

Peaches: R. G. H. Without aeeing the treen we are $^{\text {a }}$. unable to do more than make a guess at the cause of the evils complained of. We know how everely the salpharous fumes of coke-ovens and burning pit-heaps affect the fruit trees at Lambton Castle ; and it does not seem improbable that the proximity of the smoky diatrict of Bgker and the aurroanding factories and collieries may have exercised a baneful influence on the trees.
Roses: J. C. S. We do not undertake to name Rosen. Sulphide of Potassium: E. H. Kept by mont chemiste.
Tomatos: W.J. The fraita have the "black apot," a dispase canaed by a fanga, Peronorpora lyco. peraici. Cat off forthwith, and barn all affected fruits, and dreat the plant with the Bordeaux Mixtare.
Vegetable Marrows Disiased: J. L. Wa cannot tell from your description of the case what it is that causen the lose of the plante. Kindly send an entire plant, or, at least, leavea, shoots, and roots, for our inspection. In the mean while, employ the Bordeana Mixture against it; of conre taking care to wath all fruite before cooking them.

Conmumcations Received. - W. R. G.-T. H. O.-R. D.

Phot graphs, dfecimens, \&c., Receivid with Thinks, Sander \& Cu. - K. Mider. Tomatos (nexr wepl) - F. W. O. cannot reply by port-G. W. W-G. W. (uext weel). we

Gardrners and others Wanting Situations. 26 words, including name and address, 18.6d., and $6 d$. for every additional line (about nine words) or part of a line. These Advertisements must be prepaid. This scale does not apply to announcements of Vacant Situations, which are charged at the ordinary scale.
Births, Deaths, and Marriages, 5s. each insertion.
Notice to Advertiskrs. - In many instances Remittances in Payment of Repeat Advertisements are received without name, address, or anything beyond the postmark on envelope by which to identify the sender; this in all cases causes a very great deal of trouble, and frequently the sender cannot be identified at all.

Advertisers are requested when Romitting to give their Names and $\Delta d d r e s s e s$, and also a Reference to the Advertisements which they wish repeated.
Position.-Advertisers are specially requested to note, that under no circumstances whatever can any particular position be guaranteed for advertisements occupying less space than an entire column.
Pobtal Orders.-To Advertisers, Subscribets, and Others.-It is very important in remitting by Postal Order that it should be filled in payable at GREAT OUEEN STREET, London, W.C., to A. G. Martin, as, unless the number of a Postal Order is known, and it has been made payable at a particular office, and to a particular person, it is impossible to prevent any person into whose hands it may fall from negotiating it.
N.B.-The best and safest means of Remitting is by POST-OFFICE MONEY ORDER.
Advertisements for the current week MUST reach the Office by first post, Thursday morning.
an Advartinemonta should be sddressed to the PUBLIBHEB
Prbushing Offce and Offce for Advertigemente 41, Welineron Stpert, Stuand, W.C.

SATURDAY, JULY 27, 180\%.

## THE GARDEN CINERARIA.

 $\mathrm{A}^{\text {DDITIONAL evidence }}$ has now to be reoorded which may be of importanoe in relation to the question as to the origin of the garden varieties of Cineraria (see pp. 588 and 655 of our last volume). At any rate, it has value independently of any specifio application. In the first place, we have the positive testimony of Mr. Kelway in the Gardeners Magazine for June 29. Mr. Kelway claims that the garden Cineraria originated with him in 1837. In that year he raised seeds from Cineraria cruenta, and amongst the seedlings observed several having a distinct ring of white round the disc (a feature, we may add, much more characteristio, so far as we have observed, of S. Heritieri than of S. cruentus). From these Mr. Kelway selected two, and from these two be raised other seedlings much improved in habit and in the shape of the bloom, and handed them over to Messrs. Webber \& Pearce, of Merriott. Mr. Kelway, however, retained some himself, and their descendants now occupy several large houses. Mr. Kelway's plants then, are, in his opinion, pure uncrossed descendants from $S$. oruentus.But nearly thirty years previously hybrid Cinerarias were in existence in Germany, to say nothing of others, which it is alleged were raised in 1824, and in subsequent years.

It may then be taken as established that there were in the early part of the century seedling variations from S. cruentus, and also that there were crossed variations in which some other species than cruentus was concorned. These facts suggest an enquiry as to the cause of the seedling variations; and secondly, an enquiry whether the Cinerarias as now grown originated exolusively from one or from the other category. The first sabject is too vast and too recondite to be entered upon within the limits of a note, particularly as there is no direct evidence to be adduced. As a conjecture, we should think it very likely that seedling variations are the result of the dissociation of previously-mixed oharaoters, the mixture having taken plaoe perhaps ages since.

That the Cineraria, as we now know it, may have had a hybrid origin wittin comparatively recent times, is a bypothesis, which the facts now to be recorded show, is not to be summarily dismissed as unworthy of credence.

We have to thank Mr. Lynch, the Curator of the Cambridge Botanic Garden for specimens of a remarkable Cineraria which made its appearanoe in that establishment. Some plants of Senecio Heritieri, DC. (= Cineraria lanata, L'Herit.), were received, as Mr. Lynch informs us, from Kew, and, as it was desired to perpetuate the specien, seeds were collected and sown in the ordinary way. Only one seedling came up, however, bat this one showed a marked deviation from the type, and the colour of its flowers proved to be a redpurple self, with, in some particnlars, much of the appearance of a poor-flowered common Cine-
raria, although quite different in other respects. Mr. Lynch was naturally much struck with these peculiarities, and knowing that the only allied plants in the house were some garden Cinerarias, whioh flowered at the same time, he naturally concluded that the seedling was a chanoe hybrid, in which the garden Cineraria, or male parent, strongly predominated; and this seems highly probable from an inspection of the speoimens. It is, however, possible that the new comer may have been a seedling variation from a common Cineraria.

The Cineraria is too well known to require description, and it will suffice to mention its stout herbaceons stems, very large basal leaves, and auricled upper ones, in order to contrast it with those of the Senecio Heritieri, or supposed seed-parent, a figure of which will be found at plate 3987 of the Botanical Magazine. This latter is a half-shrubby plant, with slender white branches and cordate lobed leaves, ranging from about 1 to 3 inches in breadth, green above, densely white tomentose beneath, and the petioles without basal aurioles. The corymbs are lax, the flower-heads over an inch aoross, and the ray-florets white, tipped with light redparple, and somewhat stellate. The hybrid shows evidence of its descent from Senecio Heritieri in its white stems, and the dense tomentum of the under-side of the leaves. The stem, however, has become nearly herbaoeous, and more than twice as broad as in the seed-parent, and the area of the basal leaves is four times as great. Some of the upper leaves are also aurioled at the base, and the tomentum of the under surface of all the leaves is strongly suffused with that peouliar shade of red-parple to which the originsl Senecio ornentus owes its name. The flowers have already been described. Thas, if this is, as seems to be the oase, a seedling from Senecio Heritieri, a distinct advance has been made in the direction of the garden Cineraria, and as the ciroumstances are fully known, it seems clear that the pollen was derived from the latter-probably carried by bees, whose exploits in this direction will be familiar to every gardener.

Shortly after the receipt of Mr. Lynoh's spenimens, we were privileged to see another specimen, presumably also of hybrid origin. This came from J. T. Bennett Poë, Esq., who tells as that in his garden in the south of Ireland, as in the Cambridge garden, a Cineraria came up fortaitously in a flower-pot in a house where C. Heritieri was growing, together with sundry garden Cinerarias. The plant has been since cultivated by Mr. Poë, and is of dwarf habit, with long-stalked, cordate, irregularly lobed, roundish leaves, destitute of auricles, and thinly olothed with white down on the under surface. The inflorescence and lilac flower-heads with a white ring are like those of C. Heritieri, intermediate between those of that species and those of a garden Cineraria. Here, then, is presumptive evidence of the existence of two bybrid plants in the origination of neither of which did $S$ ornentns directly take part, and both of which had a white ring, which is less visible in cruentus.

The plants are interesting and very instructive. They do not prove that our garden Cinerarias are of hybrid origin, but at all events they show, as we have already suggested, how easily a very few experiments might be made which would go far to settle the dispated points. As the true Senecio orueatas is now in cultivation, we would suggest that the authorities at Kew, as well as Mr. Lynch or others should, another season, endeavour to cross
it with S. Heritieri both ways, and carefully note the charaoters of the resalting hybrids, if such were obtained. A note by Willdenow is instructive in this connection. In 1809 he briefly described a Cineraria hybrida (Enum. Pl. Hort. Berol., p. 893), which he stated was oultivated in the Berlin garden as Cineraris cruenta, but which differed abundantly in having flowers nearly as in C. lanata (i.e., Senecio Heritieri). The cross we have just suggested would probably yield this C. hybrida, and should certainly be attempted. We do not know if a dried speoimen of this plant exists at Berlin, bat if so we hope our Berlin friends will let us know what it is like.

Another important cross should be attempted, namely, one between S. cruentus and S. populi-folius-the latter species being also in oultivation. This might demonstrate the origin of Cineraria lactea, other wise oalled Senesio cruenta var. laotea (Jacq. Ecl. Pl. Rar., t. 105), which De Candolle believed was a hybrid between S. cruentus and S. populifolias. It originated in the Jardin des Plantes at Paris, we believe, prior to 1813. We have had the good fortune to see a dried specimen of this plant, and having compared the plate cited with the two supposed species, we believe that De Candolle's judgment to be perfectly correct. The resemblance to Senecio ornentus is unmistakable, yet it is evidently not a variety of that plant, for it is nearer to S. populifolius, and instead of the basal auricles of the former, has a few small appendages near the apex of the petiole, as in the latter. Two or three well-conducted experiments might prove the origin of these plants, which are believed to be in the direct line of descent of the garden Cineraria of to-day-we use the term in its ordinary sense, for, botanioally speaking, the plant is not a Cineraria, but a Seneoio.

Incidentally we may add, that seedling plants of Cineraria cruenta differ markedly in appearance from those of a garden Cineraria. We need not, at present, trouble the reader with a detailed account of these differenoes, hoping eventually to be able to examine seedling plants of C . Heritieri and other species.

Nor need we go further now into the vezed question of the origin of the garden plant; but in reference to a remark made at p. 588, it is only justioe to our contributor, Mr. Rolfe, to state that his artiole was not written with any special reference to the question of hybridity, and that the figures and notes respecting the garden-plants were added by us after the manuscript had left his hands. It was a matter of ourrent opinion that the plant then flowering at Kew was the wild original of the garden Cineraria. Mr. Rolfe accepted the ourrent version, as we did ourselves, without oritioally examining the evidence in support of it or otherwise.

Reverting for a moment to the interesting plant sent us by Mr. Lynch, we may remark that it shows how quickly the characters of one parent may be partially obliterated, and we should not be surprised to find that a course of selection would complete the process without further orossing. Selection has made the gardenplant almost an annual-in actual practice at least, and this would tend to eliminate the shrubby character, and retain the herbaceous one. Mere superfioial comparison of wild and garden plants is not absolutely conclusive of the matter. Who, for instance, ignorant of the history of the tuberous Begonias, could trace in many of them any sign of B. bolivieneis or other species, well known to have taken part in the genesis of the race?

# New or Noteworthy Plants. 

## ROSA WICHURAIANA.

Although this species was only introduced to Britain about three years ago, it already affords promise of being a valuable addition to the wild types of Roma in cultivation. It is distinct from any other species, and is easily recognied by the perfectly prostrate habit, and by the peculiarly bright, almont glansy appearance of the leaver. A receas figure of it has been pablished in the Botanical Magazine, under the name of R. Luciz, but the typical R. Wichuraiana is afficiently distinct for the name to be retained in gardens. M. Crépin, 1 leading continental authority on Roser , and the author of the present name, still regards it, I belipre, as being specifically distinct. It is a native of Japan, and belongs to the polyantha group. Tpo leaves are quite mooth on both surfaces, the leafotn of elliptical outline, serrated, from $\frac{1}{3}$ to $\frac{3}{4}$ in. long, and varying in number from five to nine on each lesf, The stipules are not fringed, as in $R$. maltilion, but slightly toothed, and a pair of short decurved spine guard the base of each leaf. The flowera aro pure white, and atand up above the foliage, which forms a dense covering, completely hiding tho ground. The pecies flowered at Kew for the firw time in 1893, and has proved a free-flowering and luxariant grower. I measured a shoot made lat year which was more than 12 feet in length. In the United States (from which country it reached us) it is highly spoken of, flowering so profurely $u$ to give, at a distance, the effect of snow. It in well adapted for covering sunny slopes, mounds, \&en, and may be commended to the notice of all who take an interest in the original types of Rona. W. $d_{0}$ Bean.

## Orchid Notes and Gleanimgs.

## CATTLEYA LABIATA MOSSI 压.

A corrzepondent kindly furnishes us with a flowe in which, as not unfrequently happens, the flow parts are in two, thus the two outer sepals are cromed by two inner sepaly, followed by four petals in a single whorl, two of the petain being of the form of the lateral petaly, the other two being lips. The columa is normal, but no ovary is formed.

From the Horticulture Internationale, Brawelf, comer a flower of the amme variety in which the lip in inseparate from the column, and greatly reducod in size.

## Cypriprdium Liebaudianum $X$.

A cross from C . lævigatam by C . Haynaldianam, raised by Mr. Page, gardener to Robert Lebandy of Bougival. The influence of the pollen-parent is very perceptible. The description is given in the last number of the Journal de las Societé Nationale in France.

Odontoglossums at Bankfiged, Bradford.
Henry Mason, Esq., in his pretty gardens in the Bingley auburb of Bradford, does not attempt to grow a collection of Orchids, but he growa a housef of Odontoglomams, and his gardener, Mr. Midgley, perfectly underatand their culture, and obtaisi satinfactory realts. At the time of our vialt, probably no other Orchid-house of equal size could have possessed a finer display of flower-spikel of the best varieties of Odontoglosamm crispam, and, in a lesser degree, of other ipecies Many of the plants have been cultivated in this house for neveral yearm, and the progressive staget murked on their large plamp pseudo-bulbe bespent good culture. The house in which the plants ate cultivated is a apan-roof of rather low pitch, a padin of moisture-holding York stone runs up the middle, and beneath the staging on each side rain-water tanke occupy the greater part of the floor. Tho ataging is of iron, the lower one being constructed close, so aa to hold water, and the aacending athe above it is of trellis woodwork, in order to elevats. the plante at the point farthert from the path, and
inverted pota are slano used for this parpose where found necessary. The shading is on the outside of the roof, and it is arranged to run on supports, which keep it well above the glats, so that in the hottest weather the houne is kept at a comfortably cool temperature. These are point which are invariably to be found in any cool Orchid-house in which the plants thrive, and in apite of occasional attempta to improve on it, it is atill the best pattern of a cool-house-the abandant tankage, which some Orchidgrowers decry, being still one of the healthiest feataren in such honse。
Among the large-flowered O. crispum at Bankfield not a single indifferent form appeared, while some were remarkable for their spotting. Among these were the handsome Odontoglossuma crispum Stevensii, a fine form of the $O$. Jenningsianum clase, with rose-tinted flowers blotched with purple; and several very handsome varieties of $O$. Andersonianum. Also in bloom were a few good plants of O. polyxanthum, O. triamphans, Cymbidinm Lowianum, and Oncidium macranthum, the whole making a fine display, and pointing to the advisability of growing one class of Orchid well, rather than a general collection in an indifferent condition.
In the Cacumber-honse a bank of Coelogyne cristata was remarked in fine condition, with a large plant of C. c. alba in the centre.
The Vineries and Peach-houses were bright with taberous Begonias, Pelargoniums, \&ce; and the conervatory was chiefly filled with large plant of Camellia and greenhouse Rhododendrons, with Odontoglossum citrosmum displayed on the roof. Mr. Midgley prides himself on his kitchen garden, which he keeps in perfect order ; and in the flower garden the Roses were very fine, notwithstanding the severity of the past winter.

## DENDROBIUM CRUENTUM.

This fine Dendrobium was originally discovered by Mensra. F. Sander \& Co., on the Weat Coast of the Malay peninsula, and deacribed by the late Professor Reichenbach in the Gardeners' Chronicle xxi. (1894), po 604. It has alway been scarce in gardene, and not until a recent importation by the same firm have good healthy apecimens been obtainable. It flowers, which are thick and wax-like in sabstance, are of ivory white tinged with green, the distinct keels at the back of the sepals being often of an emerald green colour. The lip is handaomely marked with crimson. As may be inferred from the locality in which the plant is found, its proper place in a warm and moint house; the only difference between the resting and the growing meason being marked by withholding water for a time after the growthe are fully made up. Now that good apecimens are in the country (fig. 17), it proves a good grower, which had formerly been donbted.

The Rosary.

## NOTES UPON NEW ROSES.

Muce interest is felt by romarians in the question whether certain new varietiea of Ronem are seally acquisitions in the true sense, or merely possess some slight distinctive quality without sufficient merit to warrant their cultivation in the fatare. We never have too many really good new Roset, and it is all the more pleasing to find our home-raiers again so well in front of our Continental friends.
Without the leath heritation, the palm muat go to the Measte. Dicksons of Newtownards, Ireland. Many of us who saw their box of twelve diatinct new Rones, which won at the National Rose Societg's Show at the Cryatal Palace, were mach strack with the beaaty of the flowers therein. Usually one finds one or two fairly good flowers, the remainder being indifforent. Bat in this dozen there was good quality and pleasing variety. Oar mont experienced growers were load in their praise ; and I may also mention as an intereating fact, that
no fewer than ten of the twelve are of Mesmra. Dicknons' own raining. Bat to get a little closer to our notes. Mariel Grabame, this is, as I adjadged it, a sport from Catherine Mermet, nud no Tea-scented Rose of grester promise has been wont out for many years. We know of the fine qualitien possensed by one of its parents and by its nister sport The Bride. Messrs. Dicksons told me that it is in every way a counterpart of Catherine Mermet excepting in the colour, which is a pale creamy-white, delicately flubhed with very noft rose. The 600 miles journey that this variety had endured in trying weather for any cut Rose, impressed me very favourably, seeing that the bloom was ataged in such a fresh condition, and I have little donbt that the card of Commendation will be replaced by the coveted Gold Medal npon it next appearance.
Countess of Caledon in a hybrid Tea, and a great addition to this class of Rones. It is a grand grower, of a perfectly distinct shade of colour, namely a pink and soft shade of rose combined, and an a decorative plant it is sure to be in good demand. A card of Commendation was also awarded here. Tom Wood is a Rose of a very pleaning colour, being of a deeper tint, and I should judge it to be also a much faller

Rose than Madame Casin. Lady Moyra Beanclere gave me the impression of Ernest Metz and Madame de Watteville combined. Bat the best and most connistent of all the new varieties, was Mra. R. G. Sharman Crawford, \& H. P. of extra merit. Whenever shown it has been a grest attraction, not only because of its deep rosy-pink coloar, which is dintinct, but on account of the bold manner in which the blooms are borne, the base of the petals being mach lighter than the tips, while on the outsides they are shaded with pale flesh pink. The form is perfect, size good, and with me it has kept a certain freshness of shading that few other Roses conld retsin during the late sultry westher. This is a Gold Medal Rose, while the firat prizes and Firsteclasn Certificates it has won are very numerous. A boz of twelve blooms was decidedly among the very beat ataged at the Cryatal Palase. Like Mra. John Laing, it has no fanlt, and will be equally indispensable in collections. Helen Keller (H.P.) has not yet won the Gold Medal, but it has secured almost a dozen First-clase Certificater ; it is a splendid grower and bloomer, after the style of Mra. John Laing, but distinct from that variety. Matourneen (H.P.) I have only seen twice, and it gave me the impression of resembling Helen Keller
and Mrs. R. G. Sharman Crawford combined; colour a silvery-flesh, with roue abading. I am told that ita growth and freedom in blooming is remarkable.
Avoca (Tea) is somewhat like Ernest Metz for size and form, but it was atill considerably brighter, after a long journey which necessitated ita boing cat upwards of thirty hours.
Marchioness of Downshire (H.P.), one of last year's Gold Medal roses, I did not think so much of as before, but the meavon has been againet a Rose of this class. The colour in a satiny-pink, of great clearness, and with delicate rose pink shading. This is one of the most distinct Roses we have, and will yet, be shown in grand form by those who poseess it.
Marquise de Litta (H.T.) is a very pecaliarly shaded form of La France (H.T.). It is a good grower and free bloomer; carmine-rone with a vermilion centre, the two thader blending in a unique and pleasing way. A treble at Gloncester, and aeveral good aingles at the Cryatal Palace, atamp this as a promising H. Tea.
Clio, Sylph, Alister, Stella Gray, Lorna Doone, Corinna, Dake of Fife, Shamrock, Captain Haywood, and Robin Lyth have pleased me most among the remainder. At Gloucester, Richmond, and the Cryatal Palace by far the best of the new Penzance Briara was Jeannie Deans, a wemi-doable flower with very nhowy ntamens. Ite colour is brighter than that of the others, and the flowers are far leat fleeting. A. $P$.

## Plant Notes.

## ALSTREMERIAS.

Tex large clumps of these growing in the border on either side of the ontrance to the Black Hamburghhouse at Gunnersbury Park cume through the severe winter unharmed, the only protection afforded being a mulch of manare and leaves placed over the ground to the depth of about 6 inches. The position is sunny and hot, and, being on a slight alope, is perhaps favourable to the well-being of the taberous roots. It would be interesting to know when the roota were firat planted on this particular apot, and how many varieties were originally placed there. One thing is quite certain-that the origial clumps have enormonsly increased, the tubers being pushed further and further afield as the seasons paos. They are never diaturbed, bat have reached the extreme edge of the border.
It hat been remarked, that "Alotroemerian were at one time much more largely grown than they are at present, and the genas was represented in every garden." This, it is to be feared, is generally trae ; and yet many inferior abjecte are grown in borders that do not possess a tithe of the beauty of the Alstroemeria. Exposare to the full blaze of the aun appeara to be immaterial, so long an there is good cultivation, an is conclunively thown in the experience of the plant at Gunnerabary, where it occapies a apot quite shadelens daring the hottest part of the day. Water is rarely given; the mulch economises the moisture in the aoil, and the plante rarely suffer for lack of it.
It is not because any difficulty is experienced in obtaining plante that the area of cultivation has become to circumscribed. There are certain apecien and their varieties that are readily, procurable, such at aurantiace, orange-yellow, atreaked and apotsed with red, which is found to vary under cultivation, but all are verg showy; auren, golden-yellow, probably a variety of the foregoing; chilensia and its varieties, varying in colour from delicate rose to deep orange or red; ocalata, a doabefal species, colour rone-parple ; Pelegrina, purple and white, and ite white variety, albs-perhaps one of the tenderest ; paittacina, crimoon and purple; and pulchra (tricoloi), white, cream, and yellow. When planted, a compost of peat, leaf-mould, and sandy loam ohould be employed.
There appeara to be no common name for the Alaticemeria, though one or two forme are known as St. Martin's flower; and the white form of Pelegrina
bears the name of the Lily of the Incas. This should have a apecially warm apot if planted in the open, or, failing that, the protection of glass. R.D.

## Hydrangea Hobtensia var. Lindleyi.

In Cornwall and Devon Hydrangea Hortensia is one of the nhowiest of hardy flowering shrab; ; in Mr. Rashleigh's garden at Menabilly especially, it is aned in great nnmbers and with admirable effect in partially shaded positions in the vicinity of walks and carriage-drives. Farther north it is seen in great beanty, but only in favoared localitiey, or after unusually mild winters. Near London it rarely flowers oatside, the winters being asaally ${ }^{0}$ severe as to destroy the terminal bud. The variety Lindleyi possesses this advantage, however; no matter how badly hit by frost, it pashes up shoots freely from the axillary buds on the previous eearon's growth, and as thene (unlike the common Hydrangea) flower the name neason, the loss of the terminal bud is of little account. The flowers of this variety are of a pale rose colour, appearing in flat corymbe, which menaure 3 to 5 inches acrons, the onter row consiating of large-petalled, aterils flowert. The variety is abundantly repremented in the collection at Kew, and is now in bloom there. Other bardy apecies that flower well are H. panicalata, H. radiata, H. pekinensio, and H. arborescens ; but with the poasible exception of H. paniculata, the plant ander notice may be considered the bent of the genus for outdoor planting. It is known also ander the names of H . rosea-alba and H . japonica.

## Stringa japomica.

This Japanese Lilac has been deacribed in glowing terms by horticulturita in the United States, and by visitors who have seen it in flower in that country. In England it hat not been cultivated long enough for anyone to any with certainty what rank it will eventually take among hardy treen and shrubs, for it has not flowered above two or three times, and many Japanese deciduous thing succeed much better in the United Staten than they do under our duller akies. It iv, at any rate, perfectly hardy, and two amall bushes were in flower at Kow during the early part of Jaly.
Syringa japonica is a small tree of vigorous habit, which forms a diatinct trunk, Its leaves are broadly ovate, very alightly downy, and pale green in colour on the lower surface, dark green and glabrous above. On the small apecimens at Kew their texture and nize resemble the common Lilac. The amall white, alightly fragrant, flowers (about $\frac{1}{4}$ inch in dismeter) are produced in large compound panicles; of about 1 foot in length at Kew, but on fall-grown plants they are dencribed at at least twice as large. The general appearance of this plant when in flower auggeate a connecting-link between the Lilace and the Privete. The apecien is a native of the Northern Itland of Japan, and wae introduced to the Arnold Arboretum in 1876.

## Rosa setigrba.

Although the wild types of Rosa are generally past their flowering season at this date, R, netigera in now at ita best. It is a North American ahrab, and is known there and here an the Prairie Rowe. It differe from all other native species in ite nemiacandent habit. Aboat a dozen plants arranged in a group are now making a pretty diaplay in the Ros collection at Kew. In habit it ponsesses the vigour and grace unally associated with rambling Rosen. The shoots are long and arching, and the laxariant leafage, of a rich bright green, makes an admirable vetting to the flowern. The leafletes number from three to five, and are remarkable for their large nize, some being 3 incher long by $1 \frac{1}{4}$ inches wide; the under surface and the petiolen are covered with fine down. The flowere single, of a very bright shade of roue, measare 3 inches acrosu, are devoid of fragrance, and come in dense clanters, amid the foliage. The beanty of this apecies of Rose, and its valuable property of flowering late in the reseon, do not appear to be fully appreciated even in the United Stater, and atill less in this country. W. J. Bean.

## PRESERVING FRUIT.

Considmbing the increase that hav taken place in fruit production within the last few years, and recogniaing that the preserving of fruit, so that it may come out perfect at the end of several months, mast be of immense benefit to growers, who at the time the fruit is ripe often have to accept prices for it which do not pay the cost of gathering, we give the following extract from an excellent lecture upon the subject of the "Preserving of Fruit," given by Miss Maria Parloe, teacher of cooking, Boston, and delivered in connection with the Masaachasetts Horticultaral Society.
There are two way, said Miss Parloe, of interpreting the word "preserving," as applied to frait, the general underatanding among housekeepera being that the frait is cooked with a generous amount of ungar, the product being a rich compound of goodkeeping quality. In its broadest sense, "preserving," when applied to food, means to ave from decay by drying, canning, combining with a prenervative abbstance, \&c. It is the latter sense with which the lecture deala.
The most primitive method of preserving food. was by drying the raw article in the ann and air, and thia is atill practised to a great extent. Artificial methods are now used, but the sun developa in some froits a lavour which is lacking when artificial heat is ased.
Although nearly every Raisin grower in Californiz has a drying house, he resorts to it only when the sun faile him. In the cane of Peaches, Applea, and Apricots, the fruit has a frether and more appetiaing appearance when dried in the evaporators, and its commercial value is, therefore, greater. When drying fruit, it is important not only that it shall be sound and of good quality, but also that it shall be prepared quickly and dried rapidly. When all moiture is expelled, it will keep for years in a dry place.
The second method of drying is to cook the fruit a long time, reducing it aa nearly as possible, to a paste, spreading this in thin sheets, and drying in the an or by evaporation. When free from moistare, this fruit can be packed in boxen and will keep indefinitely, and is saitable for traneporting long distances, as for the nee of armies or emigrants. When fruit dried by either of thene two methode is to be naed, it must be softened by the addition of water and cooking.
A third process of drying is to cook the fruit for a long time with angar and water, and then partially dry it. In this case the nugar is largely the preservative agent, and the drying goes on only until no syrup drips from the frait. With clone packing in boxes or jars the frait will keep well in any climate ; hardening, of course, when exposed to the air for a conaiderable period. This fruit is ready for use at any time, but is more of a confection than a aauce.
Thene three methode enable all to have the Figa, Dates, Prunes, Apricots, Apples, Peachen, \&ce. of the world. In New England, where most of the fruite are preeerved by canning, they are apt to lone night of the enormous amount of wealth, health, and comfort that these methods of preserving represent.
The more modern procen for preterving fruits, and by far the mont uneful and healthful, is that of canning. This seeman to have been introduced to the French Government in 1810 by Appert. Since then it has been conatantly improved. The dentraction of germs, and the exclavion of air, are the principles upon which canning is based. The article to be preserved is cooked for a short time, and is then put in jars from which the air has been expelled by heating them to the boiling-point.
They are then sealed, and when cold, are net in a cool, dark place. If all the conditions be right, the heating of the cans and fruit thorough, and if the cans, covers, \&cc., be in perfect condition, the fruit will keep for an unlimited number of yeara, and When opened, will be found to have nearly all the freennens and aroma of newly-gathered frait. Whilst this is true of the majority of fruite, it is not mo of
all. The Strawberry sabject all. The Strawberry sabjected to this process
will come out a pale, apongy, insipid thing; whereu the Raspberry weems to have ite colour, flavour, and odour intensified, If, however, a generous amount of augar be added to the Strawberry in the cooking, it will retain its shape, colour, and flavour.
It is an error to attempt to can the Strawberry withoat sugar, or with only a small amount. Neithyer can sugar be put to Strawberries and then the frait allowed to atand, as with Pine-apple. The cagur aeems to draw the juice out of the frait and leave it a apongy mant.
Some fruits can be canned without heat or mgur, The jar should be packed fall of the fruit and then placed ander a fancet, having the water run in rapidly for a minate, that all the air in the jar shall be displaced; then aeal, and pat away in a cool, dark place. Perhaps not many kinds of frait would keep if pat up in this manner. Certainly, there can be no expectation of success with juicy fruit of any kind, Mins Parloe has, however, been successful with Rhobarb. Green Gooseberries and some kinds of Plums can be preserved in this manner. It seems to be a question whether the acid in these fruits does not have a good deal to do with the keeping quality. Many kinds of frait can be mized with their own weight in angar, packed in jars, sealed and pat amy in a dark, cool place. They will keep well, and have the flavour of the fresh fruit. It has been found in the case of small berries pat up in this manner that the seeds become harder and more noticeable than in the cooked fruit. Pine-apple should not be put op in any other way than this, as it comes out aimply perfect.
The third method of preserving fruit is by cooking it with sugar. In this case augar is largely the preo servative; and where the sagar is added to the frait, pound for pound, it is not necessary to mal the product. Bat the "self-sealing" jares are no convenient that most housekeepers prefer to we them rather than the old-fashioned stone jarr. The French candied fruits are an example of another method of preserving fruit.
Having glanced at the various methods of pro. serving, the lecturer turned to consider some of the exsct ateps necessary to secure the best reanlts. More fruit is preserved by the exclusion of air than by any other method. To be auccessful in thin, certain things are essential. Firat, the frait mut be perfectly sound; next, every utensil used in the process muat be absolutely clean; again, the cans must be perfectly air-tight; finally the cans and fruit mast be made free from germs and air before mealing, and the canned frait muat be kept in a dats, cool, dry place.
As to the different modes of treating varions kiait of fruit. It in known that when the germs are hilled and the air is excladed, augar in not necesuary for the preservation of the frait. But there are few kind of frait that are not improved by some augar, becaute it fixes the colour and flavour, and gives much fine renalts. Some kinds of fruit require but littie aggy for this purpose, while others are poor indeed witho ont a generous amount. One has only to contraí the flavour and quality of the canned Peaches that are put up with and without augar, to realine the great auperiority of thone with which asccharine matter has been used. Where fruits are too dry to give out enough juice to cover themselves generouly, s light eyrap whould be used. Bat in the jaicy frais avoid water if possible. A good rule in the can of mall berries is to allow one-third of a pound of nagur to each pound of fruit. There are people who would not care for more than half that amount of nggar, while others might like more. The following hes been found a capital method for small berries: hato twelve quarts of berrien picked clean put three quarts into the prenerving-kettle and on the fire. Heat slowly, and break up with a wooden refe table-masher. Then turn the fruit into a piece of cheens-cloth and preas out the juice. Wash the preserving-kettle, and put the jaice and sugur into it, stirring until the sugar melts. When the syrap boils, skim it, and add the whole berries. Watel the kettle, atirring occaaionally, antil the preserv
boils, then akim, and cook for ten minutes longer Fill the jara, and veal.
For fruit like Peaches, Pears, Plums, \&c., make a light syrup in this manner:-Pat into the preserving kettle 4 quarts of angar and 2 of water, boil, and then skim well. Have the fruit pared, and cook it gently in this ayrap until tender; then can, filling up with syrap. Q inces mast first be cooked in clear water until tender.
In paring fruit, use ailver-plated kniven, and drop ench piece as soon as pared into a bowl of cold water which has been made acid by addition of lemon-jaice. This prevents the fruit from tarning dark. Use earthen bowla and wooden or silverplated spoons. Avoid any delay while doing this work.
To peel Peacher and Plamr, pat a little of the frait into a wire basket, and plunge it into boilingwater for a few minutes. Take the basket from the boiling water, and plunge it into cold water for a few reconda ; then turn it into an earthen dish, and peel with a silver knife. Save all the jaice that falls into this bowl. When the work is properly done, the skin will peel off perfectly amooth. There in really lens wate and leas labour in removing the akins of fruit in this way than in the common way.
To fill the jara, have on the stove two pans partially filled with water. Let the water in one be boiling, but in the other not no hot but that the hand cannot be held in it with comfort. Pat a few jars and covers in the cooler water, tarning them now and then until all parts become warm, then put them in the boiling-water. This doea away with all danger of breaking. When the jars have been heated in boiling water, drain, fill, and seal them at once. In filling the jara, be aure that they atand level, that the syrup has filled all the interatices between the fruit, and that it also runs over the top of the jar. Even with this overflowing of the syrup, it will be found that, after cooling, the can is not fall ; but if the work has been properly done, the fruit will leep all right.
Preserving with angar, pound for pound, is not very extensively practised now, most people preferring the simpler and more healthfal mode of canning with a amall quantity of agar; atill, there are some fruite that are better when done in this way. There is probably no fruit more delicious than the Strawberry, either fresh or preserved, yet there is none about which the honsekeeper freele more uncertain. It is something that cannot be preserved withont plenty of sugar. The following has been found to give the greatest antisfaction. It is true the preserve is very rich, and cannot be eaten in large quantities, bat it is better to have a little in perfection than a great deal of an anastiafactory quality.
Sun-cooked Strawberries.-Ute ripe and the finent fraits. Put them in the preserving-kettle with a pound of sugar to each pound of berries; firat a layer of fruit, then a layer of augar, and so on. Do not have the mixture more than 6 inches deep. Place on the fire, and watch. When the prewerve begins to boil, skim carefully, and simmer for ten minaten. Now pour the frait into meat plattere, and place in the ann. After an exposara to the mua for twenty-four hours, put them ap in jars or tumblers, and cover. It may be said, the an does not thine twenty-four hoars, but the frait may be placed on tablea by the windows in a sunny room, and let remain there for weveral daya, or until it has had its full sun bath.
The Larger Truits.-All fraitr are prepared for prenerving in angar in the amme way as for canning. Then a rich ayrup is made-416. of sagar to a pint of water-and the fruit is simmered in it antil tender and clear. Such fruits as Qainces and hard Pearz should be cooked until tender before being put in the gyrup.
When the sugar ahould be added.-Some kinds of fruit are better for having the ungar added to them when partially cooked, while others ahould alway" have it added the moment they are placed on the fire. Again, one kind is better for atanding for hours in the sagar, while other should not have
the angar touch them antil they are ready to go on the fire. There are a few fraits which are far better without sugar than with it. This is the case with the Prune, with which sugar should never be pat, long alow cooking serving to develop a fine rich flavour. Cranberrie, on the other hand, ahould have a pint of angar to a quart of berries, and the augar, water, and berries munt go on the fire at once and be cooked rapidly for a ahort time, asy twelve to fifteen minates. No other method will give a astisfactory resalt.
Jelly.making.-In no department of preserving does the housekeeper feel lens sure of the remulte than in jelly-making, to much depends apon the condition of the frait. This is more pronoanced in the case of small fraits than with the larger kinds.

When Carranta are over-ripe, or have been picked after a rain, the reanlt of aning them will be ancertain. An underatanding of the properties in frait which form the basis of jellien may help the housekeeper to a better knowledge of the conditions and methode emential to anccens.
Pectine, which forms the baxis of vegetable jellies, is a substance which, in ita composition, resemble: atarch and gum. It gives to the juices of fruite the property of gelatinizing. This property is at its beat when the frait is jast ripe-better a little under-ripe than over-ripe. When boiled for a long time it loses its gelatinous property, and becomes of a gummy nature. These facts show the importance of uaing fruit that is bat just ripe and freehly picied, as well an the need of eare not to overcook the juice.

Canning Fruit Juice. - One form of preserves which is moat uneful, convenient, and wholenome ahould be more generally adopted than it in ; namoly, the canning of frait jaice for creams, icen, drinks, \&c. Certainly every honeekeeper ought to preverve enough of the jaices of the Strawberry, Raspberry, Peach, Apricot, Grape, \&e, for her own une. They can be preserved with or without angar, although nagar is adrocated. Boil for ten minaten, and seal while boiling hot. J. J. Willis, Harpenden.

## DENDROBIUM HILDEBRANDII.

"Turs Orchid wan firat diacovered by Mr. Hildebrand, superintendent of the S. Sban States, and aome plante wore eent to Memurn. Hugh Low a Co. Afterward my men :came acrons it, and without knowing what it was, I sent nome to Mesurn. Charleswortb, who identified it, and sold the planta. Its habitat is on the borders of Siam, a good way east of the Salween River, and some 300 miles east of Lake Inle." R. Moore, in Orchid Review, June, 1895 p. 169.

Mr. C. Leenon Prince, of the Obmervatory, Crowborough, Sunnex, who kindly sent us the photograph of the plant (fig. 18), remarke as followa :-
"Juat a year ago, I parchaned of Menarn, Charlenworth \& Co. of Bradford, a newly-imported plant of Dendrobium Hildebrandi, but the bulbs were in such an exhausted condition that I hesitated at firat to buy it ; eapecially an little appeared to be known reapecting it. However, my gardener (Mr. Slater) has aucceeded in flowering the main bulb, which is 18 irchea long, and has produced nineteen blossoms from neven apiken.
"The nepals, five in number, are nomewhat crimped, and the two lateral ones measure from $2 \frac{3}{4}$ inches to 3 inchen acrons, and are of a creamy-white colour. The lip measures exactly 1 inch at its mouth. When the flowern were fully expanded, now six weeks aince, it was removed to an intermediate house, and at this date,; June 1, 1895, the flowers are as frewh as at firat.
"It has been the admiration of all who have eeen it, and I think a large plant would be a fine sabject for exhibition parposen, an I feel quite confident that it will prove to be very floriferoun.'

## THE RELATION BETWEEN THE WEIGHT OF THE SEED AND THE GROWTH.

From Agricultural Science, the organ of the Society for the Promotion of Agricultural Science, issued in Jane, 1895, we extract the following pasaages from an article by Mr. B. T. Galloway, on the growth of Radinhes as affected by the size and weight of the seed. The anthor saym that :-" The influence of the aize and weight of the need on the growth of the plant has received considerable attention. While it is claimed by some that the size and weight of seed has no material effect on the product, the majority of those who have studied the aubject take the opposite view, and have proved their claims by well-conducted experimenta." The results of such enquiries are thas summarised at the end of the paper: " 1 . The large seed germinated more quickly and with more certainty, and produced marketable plante sooner and more uniformly than the small weed. 2. The mall seed gave proportionately larger plante than the large seed, but in practice this does not warrant the use of the former. The practical conclusions that may be deduced from the experiment are :-1. That by the ane of large seed from 85 to 90 per cent. of the crop may be brought in at the mame time. 2. That practically all the plante than grown being marketable, no ground is wasted. 3. That enongh time is aaved by uaing large weed to grow one additional crop during the seamon; in other words, if four cropeare grown, uaing mixed seed, and waiting for all the plante to attain sufficient aize for market, five cropa can be obtained if large need is planted. 4. That the only additional expense is the extra amount of seed needed, all the maller onen being sifted oat and
thrown away. The extra expenue will average about 25 cents per poand of need, and when it in known that a pound of seed will plant about 1500 square feet, the matter of extra expense become trivial."

## Nurbery Notes.

## THE FERN NURSERIES, SALE.

Tere collection of Ferns grown by W. \& J. Birkenhead, is growing in importance every year. The firm, as is well known, make Ferns a apecialty, and rince the great Fern Conference hela in London in 1890, at which they received the Gold Medal of the Royal Horticaltaral Society, they have been continually in the front at the principal nhows in the kingdom. Since the writer last visuted the nurnerien quantities of honses have been bailt, and the general condition of the plants has improved greatly. There are now aboat 1400 varieties astorted in the varions divisions, comprising stove, greenhouse, hardy exotic, British, and Filmy. A large portion of the Britinh, hardy exotic, and greenhonse kiads in sedded out into nursery rown out of doors, thus giving one an opportanity of comparing out-door and in-door growth, and selecting the most endaring for outside ferneries, rock-work, and for plantation and garden-work.

Among the most beautifal to look at in the many rows out-of-doors is the divinion of Lady Ferns, chief among them being the setigerum group, in which the bandsome cut pinnule traversing each other are conapicuous in A. filix-foemina Victorie and the dwarf and striking f.-f. grandicept. A. f.f. Verwone and its crested form catch the eye, the pinum are to wavy, and the pinnule crented. Victorix itself, apart altogether from the setigerum blood, is a grand variety, from its cron-sword-like pinnulet, and it is beautifully dwarf and compact. Another little beauty atrikes well among the group, A. f.-f. digitatum tenue, and do aloo the forms of f.-f. congentum and its dwarfer, more crested fellow, congestum cisitatum. A. f.f. Kilmoryensis is a plearing green, making a atylish plant. These and othera have partially suffered from the aharp frost of Jane 6, bat are now recovering. Some more, particularly Osmunda regalis, are growing ander a batch of standard Apple and Plum trees, but Mr. Birkenhead naye they do much better out in the oper, because the moiatare stolan from them by the frit-tree roots operstes prejadicially; and, moreover, these bedded-out Ferns show to much better advantage in the artuma after the indoor ones are partially giving way.
In a lean-to house, these hardy Britich Ferns are in great exaberance. We noticed particularly a welected form of Athyrium f.-f. setigeruna called grandicept (Birkenhead, raiser), with tall apright frond closely packed together, and much broader in pinnule than the normal form. Another gem is A. f.-f. plumosum elegans, so light in the green and arching in the pinne: A. f.-f. Todeoides is like the Todea in habit. A. fo.f. conglomeratum is very heavily crested, and a capital rockwork Fern. There are one or two promising forms alonguide of this of the same breed. A. f.-f. Elwardnif is another fine dwarf variety. A. f.-f. acrocladon has much-branched froade, and is very heavily created-like cockscomb, in fact. A. f.-f. plamosum superbum is the chief of its class, the frond are of a fine lastroas green, and the crested form of grandicaps is one of the very finent of the plumose groap. For apecimen plant purposes thes plamosum take front rank. A. f.-f. Pritchardi in abundantly distinct from its compeers, having long and narrow fronds, which are aptly likened to in waggoner's whip. The male Fern, Lastrea flix-mas, is represented in a good many Tarieties, pontibly the choicest being the crinpy fronded Aactuona, sometime called crippatistima, abandantly diatinct from the type. The pretty dwarfer grower decora is noticeable.
Arong the Mountaia Buclier forms we noted Oreopteris ramo-coronans, a much-branched and cretted form, as ite name show, an in Latrea peendo-
mas cristata fimbriata, is mach cut and beantifally crented, an admirable companion to the rare ramosissima. The Pseudo-mat coronaria (Birkenhead, raiser), is a atriking form of this division. Lastrea dilatata grandiceps is a stylish-looking fine crested form of admirable greenery. Polystichum angulare cristatum is one of the most striking of its class; P. a. plumosum, as its name implies, has spreading feathery fronds, making a fine apecimen-a worthy fellow to the beantifal longipinnulum. There in a particular form of P . aculeatum, whose young fronds are more than usually beautiful. Woodsia alpina, one of our rarent natives is doing well on a shelf in this house.
The span-roof honses are about 50 by 10 feet, and are closely shaded in the interior with a kind of scrim, they do duty for British Forns in quantities. Some of the commoner forms are not to be despised even among varieties, although some of them require glass protection. For instance, Aspleniam lancifoliam was beautiful so grown. The Scolopendriums were a grand groap, one named fimbriatum is deeply frilled and fimbriated, and shoots cut to advantage; cristulatum, is abandantly crested, and makera very atriking plant. Moonæ is fally crested and fimbriated, and Clapham's ramo-cristatum is one of the boldeat created and freent growing of this admirable Hart's-tongue divinion; Lastrea æmula, and particularly L. densa, are very compact and distinct, and amell like new-mown hay. Polystichum congeatum polydactylon make fine ornamental pot plants. What a fine deep green the depending form of Peeris depauperata puta on in its mataring fronds, with the tassel-like cresta weighing the frond down!
Among the North American FernstheViolet-scented Fern (Lastrea fragrans) is one of the most prominent, as it is one of the mont popular, because of the frond melling like Violets. A few plants in a clowe house diapense abundant fragrance. Phegopteris hexagonoptera is a Beech-looking Fern, with captivating greenery, the pinnæ deeply cut. The Japanese Lastrea atrata is dintinct and noteworthy. For a atylish exhibition plant there is nothing to beat Osmunda Claytonisna. It grows about the wame nize as the Royal Fern, but the fronds are of a pure velvety green, the fertile fronds particularly commanding attention. Onoclea rentibilis is another tall grower, with large prominent drooping pinnex, making a telling exhibition plant. Adiantam pedatum in auch a uneful plant for trade purpones, and one of the most beaatifal too, that we cannot pass it over, seeing the quantity grown here.
Amongut greenhouse Ferne the Britioh Maldenhair (Adiantam capillus veneris) doen bent under glas. There is one grand form conspicuous with finely-crested fronde, and having the pinnex larger, named daphniten. Among the cuneatum batch we noticed the following of the rarer kinds: grandiceps, crested; Luddemannianuta, also crested, and both evidently good growere; the beantiful rabellam, with its claret-tinted young fronds, and the atylish-looking Veitchii; Balantium culcitum, makes a fine apecimen plant, and its deep sea-green fronds are telling: Cheilanthes farinosa is a very handsome ailver Fern that does bent in a cool climate ; if the leant degree coddled, it becomen infested with thrips. Davallia tenuifolia Veitchiana makes a handsome specimen-so light and feathery. We noted the novel Lomaria aspera, rigid in the fronds, and so brittle, yet with pinnæ atanding erect, which makes it a very attractive plant. Another two novelties atruck un, Mohria tharifraga, and itn variety achillæfolia, beautifally cut and quite Achillea-like. The Chinene Nephrodiam in an admirable Fern, and no is N. odoratum.
Among ntove Ferns, we noted Adiantam concinnam gracile, the beantiful Farleyenue in handreds doing well, a new desirable-looking one named Feei, the white-striped macrophyllum remarkable too for ita young, pink tinted fronds, an acquisition in its way, and a comparative novelty ; and one more than uanally telling, named Weigandii, a fioe crisped form with pinnæ overlapping each other, and of a good green ahade. Amongst Divalliss, *uvpended in cork batkets,
was the charming fijienais, and a selected one, named elegans, sent out by Messrs. Birkenhead-a decided acquinition. The golden Gymnogramma Martenuii in always to the fore; but a new one named grandicept in even richer gold colour than the type, and being beantifully crested, beat it completely; the Schizophylih gloriose makes a good bauket Fern, with ita fronds depending. Oaychium auratum is a narrow-fronded species, green and gold, the fertile frond golden. Pteria aspericaulis is distinct, with its red venation, and a pretty Fern to boot; and tricolor is grown in quantity, and well grown too. The planta, notwithatanding the heat, are all remarkably clean and well grown.
Filmy Ferns occupy a considerable apace in the older houses of the narsery. They are in some camen planted out, in others in pots, all either in framen, or covered with glase with movable panes for occanional evaporation. Mr. Birkenhead nays that with atudy and the proper management the mointare is the main factor towards successful culture. These beartiful gema are not every body's plante, bat the lover of Ferns cannot help peering at them with a longing eye. Chief among those that took our fancy were Hymenophyllam at tenuatum, and the tapering caudicalatum, the dwarf and pretty nidam of the demissum type; Foraterianum, a deep green; and hirsatum, a woolly-looking subject; palcherrimum, the pendulous trifidum, nice pieces of Tanbridgense, and the equally pretty Wilsoni. Then in Todeas we would place at the very front grandipinnula, Fraseri, and Moorei; of course, auperba is the beat looking of its class, when well done, and the reat of the Todeas were going along well here. The Trichomanes alabamensis is charming to look upon; arriculatam is also beantiful, and so is the loftylooking alatum. Among others we noted T. radicans maltitadinoualy cat, and deep green; T. Lyalli, and parvalum of the fan-fronded type; T. r. dissectum cuneatam, a fine wedge-looking fronded Killsraey Fern; candens, diatinct and pretty; the beatififul trichoidium, which no collection is complete withoat, and the mall-fronded venosam.
There are other things grown to sapply the local trade, such as Rhododendrens, frait trees, some alpines, nome bedding plants, of sorta ; but the chief article of commerce is the Ferns, of which the firm claime to have the most varied and interesting trade collection in the world, consisting of over 1400 diferent kinds. Viator.

Choice Bulbs at Messes. Wallace's, Colchbetrb,
Among other choice bulbn, besiden the brilliant Calochorti, alrendy noticed, fine collections of Irites, Lilies, Brodiæas, \&ce, are grown. The Iria bedr had been sheete of bloom, but were nearly over. Seversl of the beartifal and all too-seldom-grown Brodixas, however, which bloom from April to Jaly, were still in flower. The following are among the best of those hardy balbous plants, easily grown in any warm border, producing large heads of bloom, montly in umbels, which last a long time in great perfection: - Brodiza volabilis is one of the most atrikiag. This is a twining plant with very slender stemen reashing to height of 4 or 5 feet, with beantiful rone-coloured flowers; it has this ningalar and unique peculiarity-the flowers continue freth for some time after severance from the planta. B. capitata, as its name implien, is nuch a striking coll trast to B. volubilis, that it is difficult to realise that they are of the same genus ; it has tall heade of purple flowers. There is also a choice white variets of this, which is very fius. B. coccinez grows 3 feet high on a thin wiry atera, and lasts more than a month in bloom. B. lactea and B. lilacina have mixed coloared flowers of white, grean, lilac. B. laxa, rich umbels of blue flowers, one of the best. $B_{1}$ peduncalaris produces fower tlowers on long pedicella, the umbele being over 15 inches acron, flowern por celain-white。B. rosea, a new specien, with drarl habit, with many flowers of a pale pink colour. Bo Howelli, which is one of the earliest, was, I was told one of the beat, with large umbels of beautiful porcelain-white floxers, delicately streaked with blue.

This ia hardly the seanon for a full feat of Lilies. Bot owing to the great variety grown, special cultare and skill, visitore can seldom go away unrewarded. As grown here, L. canadense is quite distinct from L. superbum. The colour varies from yellow to orange, bill shaped, heavily spotted inside the flower; L. nitidum resemblen a slender L . Humboldti, a graceful bright golden-yellow Lily, apotted
which nothing more need be said. $L$. dalmaticam is quite diatinct from the common though beaatifal Martagon in several colours. It grow to a height of from 4 to 6 feet, producing three or more sike, each pike carrying from one to two dozen of light or dark purple blooms. L. pardalinum var. minor it a amall charming variety of a well-known much-prized pecien of Lily. It bears numgrous

Fig. 19.-caippandla vidalli: flowers feite.
(Shown at the Royal Horticultural Society's meeting, July 23. See report, p. 102, col 2.)
with red, the rame as L. colambianam. In Henryi, the orange-yellow pecionm, this is one of the tallent and mont striking Lilies, growing ander cultivation to 2 height of from 5 to 8 feet in good soil, and bearing from twelve to twenty richly-coloured flowers. L. Krameri is remarkable in character and colour, the latter being a beautitul pink-rare in Lilien. L. Leichtlini is very beautiful and graceful, the colour citron-yellow, richly spotted with purple. L. longiflorum giganteum, an improvement on $L$. longiflorum and L. 1. Harriai, being larger than either, than
mall orange-coloured flowera, apotted black, the tipe of the petals being at times atained of a crimson colour. L. Parryi, one of the mont beantiful and fragrant of all Lilien; the colour a citron-yellow, npotted with chocolate-brown.

Among dwarf Lilies the following deserve upecial notice, viz., Alice Wilmon, clear lemon; I. Her. manni, flower large, of a rich crimaon-mahogany colour, the finent in the L. elegans group; Lo Van Houttei, flowers large, of a made of crimun, a very fine Lily. There wa aleo s darker coloured veriety
of the type, indeed, it was almont black, which appears to be an acquisition.

Here were to be seen many other balbs and plant of great interest, one of the most beautiful, as it is sare to become whenever, in vase or borquet, brilliant coloure are desiderated, being the bett of all Heuchera sanguinea. D. T. F.

## "THE KYOTO INDUSTRIAL EXHIBITION OF 1895."

Held in celebration of the eleven-huadredth anniveraary of the city's exiatence. Written at the requent of the Kyoto City Government by F. Brinkley. A very interesting work is the one before ut, which, though brought out on the occaaion of the Kgoto Exhibition, relates almost wholly to the ancient capital itself, and to ita many intereste and induatrien. It therefore forms wuch a guide as will tell visitore not merely about treasures actually etaged for exhibition, bat also of the wondrous sighte and delightfal surroundings of Kyoto; of the palacen, temples, diatricts, and canning craftsmen famons for various branches of art: for keramics, textilem: embroideries, metal-worky, cloiszoné enamel, and bric-a-brac. This handbook has the fascination associated with all books descriptive of Japan and her wonders, and has the great advantage of being free from the personal and imaginative paanages which too often mar the accounte of enthuasatic travellers. Therefore, the praises bsatowed upon Kyoto, the nativen, and the arte and industries, are the more acceptable and credible. The city wherein seventy-seven emperor have held their court has atill a renown of no small importance. "Kyoto," says Mr. Brinkley, "connidered under it former aspect," at a centre of art and industry, "as the chief town of a highly civilised nation, is probably the least ontentations city in the universe. Apart from it Buddhist temples, which are gorgeous and imponing, it may be deacribed an a collection o neat but rastic dwellings, nestling among hill of the mofteat possible contours, brooded over by a wonderful cryatalline atmosphere, and resonant with the gurgle of limpid atream that babble ander its bridges and beside it thoroughfares. It water, indeed, is one of the gentle city's richest posenaions. Fur these rivalets possens bleaching and dyeing properties unequalled elewhere throughout the empire, so that whoever desiren \& robe of pure white or of brilliant hae must go to meek it in the Wentern Capital (Saikyo). Kyoto is a city of garden. The humbleat dwelling hae ite tiny park, with miniature waterfalls, toy hills, and dwarf forents. Even to-day, although the tide of a ruder civilination has disturbed the quiet current of old-time life, you may find the potter or ensmeller decorating his vacen or building up his aubtle tracery of many-hued deaigna, while the flowers and leaves which he copien look in at him through the windows of his workshop." This pasage contain an explanation of the very enence of Japanese art. It in enentially a native gift, inopiration coming not from foreign sourcem, but from the every-day urroundinge of thone who have the eye to appreciate and the akill to reproduce them in all their picturenquenes. This Gaide to the Kyoto Exhibition, while dealing avowedly with the city itmelf and the chiof features of it, yet given an excellent idea of some of the charscteristice of Japan in general, which, however over-written or
over-sung, is ever new and ever original to him who looks apon it for the first time. And now, from April 1 to Jaly 31, or for even longer time if the venture prove accenstul, Japan's arte and induatries are in coure of representation at the Kyoto Extibition, whick (to turn for a moment to the business portion of our hand-book) is located in baildings extending over 9 acres of ground, sarrounded by a garden 40 actesin extent, and inclading an annexe deroted to fisherier. Altogether, the enterprise is an important one, and gives no mean indication of the wealth of resources, both actand and mental, posessed by the ingenious people who bave originated and carried it ont.

## ※CIDIUM NYMPHAOIDES, D.C.

Is November, 1877, I found floating down the river Oane, at King's Lynn, in considerable abundance. Scirpus lacastris, which had evidently been cat from the sides either of the river itself or from some tributary drain. The Scirpus wan affected with Paccinias Scirpi, D.C., which at that time had not previously been observed in Great Britain. The - Geat Oase at King's Lyan is a river of considerable sive, and for nome 14 miles above the town is tidal. It rises on the bordern of Oxford and Northamptonshire, near Brackley and Towceater, and drains an area of some 2700 square miles. The prospect of localising the affected Scirpus was therefore not very bright. Various attempts, however, have from time to time been made. The Scirpua is abundant enough along the banks, and in various draina and ditches in the fens. but never was I able to come across the Paccinia in its natural home. The river to Denver and from Denver to Ely, and the extenaive pits at Ely known ae Rusuell Hole, were searched in vain. The Puccinia is donbtless an heterccions apecies, and as it in uncommon, there in little doubt, could it be found growing naturally, one would have little difficulty in maling out ite life history, as such a pare Paccinia is not likely to have its Exidionporet ou \& very common plant.
Daring the past winter, 1894-95, I made an archeological excursion to Earith, a mall town in Hanting donshire, situated a few miles from St. Ives, on the river Oase. In one of the fen drains, the Old Bedford as it is called, an abundant growth of Scirpus exiated. affected with the Paccinia, so thet I felt aure I should at last be able to make out its affinitien.
In the Botanische Centralblatt, 1891, No, 27, Herr P. Dietel, in a resume of the paat ten years' work on the life history of the Ureoinen, states that Chodat" investigation ahow that Paccinia Scirpi, D.C. is connected with the Tecidiam on Villarsia nymphaeidet. Early in the present month, Jaly, 1895, I again vinited the Old Bedford at Earith, and was rewarded by finding the Ecidium nympheooides in great profation at the zame place in which during the winter I found the Paccinia on Scirpus lacustris, thus confirming Chodat's statement. The Scirpas war also growing abundantly in the River Oase, but all I examinad were unaffected by the parasite, neither did I find any Villarvia in the river itaelfo Charles B. Plowright, M.D., King's Lym, July 22, 4890.

## INDIA.

## Calcutta royal botanic garden.

$\Delta$ wowa the principal improvamenta effected during the jear 1894-95 in the garden, may be mentioned the entire remodelling of one of the conservatorien, which bas been laid ont on a new and more artistic plan. The road running along the river bank from the engine-houae to the gate of the Sibpur College has been conaiderably improved, and several mmall buildinga and a glase-roofed house for certain Ochids have been erected by garden labour. Dr. King's singular talent for landacape gardening bas. King's him, says the official memorandum, dariag the twenty-four years he has been in charge, to add greatly to the beanty of the garden by akilfol, grouping of treen and shanbs, and it now ranks high among similar inatitations for picturesqua scenery no leng
than for scientific completenes. than for scientific completenesu, Within the pant year he has laid the public under a further obligar tion by bringiag out a gaide to the garden, the want of which had been long felt. The book contains a map, a deacription of the garden, and a brief aketch
of its history aince its foundation in 1786, and copies can be had by purchase at the garden gates, and from Messra. Thacker, Spink \& Co., bookaellera, Caicatta.
Of the Lloyd Botanic Garden at Darjeeling, there is apparently little or nothing to record. The report does not state how far it fulfila the purpose for which it was originally established, of bringing together in one place those apecimens of the indigenous flora of the Eastern Himalayss which can be grown at the elevation of Darjeeling.

## Vegetables.

## St. DUTHUS PEA.

This fine Pea, which was awarded a Firnt-Clans Certificate by the Rogal Horticultural Society in Jubilee year (1887), han nomehow remained but little known, which is, a great pity, weeing there are a very fow better wrinkled Peas grown. It is well adapted for a last crop, continuing to bear till winter sets in. The haulm, pods, and seeds are of a dark green colour, and the production of ten Peas in a pod in quite a common occurrence, and hardly any pods have fewer than eight. The flavour is first-rate, and its cropning qualitien everything that can be desired. Why it has not taken a atronger position among late marrow-fat Peas I do not know, unless it be that, owing to its pecaliarity in remaining so long in a green condition, the seed ripens with difficalty. Although sent out six years ago, it is atill sold in quart packets to the trade, I believe, which looks as if there was not mach of it anved. It is a grand late Pea, though not no well known as it ought to be, $A . H$. [The sample of pods kindly sent by our correspondent fally bears out his statements. Ev.]

## A Nrw Pea, Rentpaykr

Seeing the interest you take in good vegetabley, I have sent you a ample of my new Pea, Rentpayer, which I think everyone will welcome, at it is what has been lacking. You will see it is a first-clans Pea, growing $1 \frac{1}{2}$ to 2 feet, strong, and robust in habit. If you saw it growing, you would say you had seen nothing like it for crop. It is a crons between Dake of Albany and Little Gro. I intend to send it out this coming apring. $H$. Brownhill, Sale.
[The plant in all that our correspondent mays of it, and the Peas, which number eight or nine in a pod, are large, dark green in colour, and of the Dake of Albany flavour when cooked. The variety partakes of the character of Little Gem in height only, in mont other respecta it is a Dalke of Albany. Grown in fields, it would do without aticks, but in the richer soil of a garden it would need to have short ones. The pods show at the upper part of the stem for about 1 foot down it. ED ]

## A New and Good Pea.

This description fairly applies to Sutton's Peerless Marrowfat, a medium, maincrop variety, which has done remarkably well in the gardens at Ddvonhurat, Chiswick, this zeamon. Mr, Gibson, the gardener there, deacribes it as the coming Pea in ita nection. It beara a large number of well-filled pode, the Peas being of good quality. From plants raized from need sown in pots on March 25, and aiterwards planted out, the first gathering was made June 20. The height of the haulm is about 2 feet. The earlient Pea at Devonhurst this seamon was that good variety, Ringleader, gathered May 31. J. B.

## The Week's Work.

THE KITCHEN GARDEN
By Jone Lambert, Gardener, Powis Castle, Welshpool. 8PINACH. - Continue to make aucceasional sowing* at regular intervals of time, choosing a cool, aomewhat shady place, as it is a plant that soon runs ap to sed in hot dry situations, and the poorer the ground the wooner it runa.

8ALSAFY AND 8CORZONERA. - If signs of running to seed are noticed, the flower-stalks mutt be removed, or the roota will be quite useless.

THE Bowing of Cabbage-beed. - Cabbage being an important crop in the apring seavon, I recommend that at least two nominga be made-one forthwith, and another at the end of the month, or, in the warmer parts of the country, the first week in Anguat. The earlier sowingu are the more important in colder districts, and anywhere north of the

Humber. In early parts the later sowings are more to be relied apon. It is a mistake to pat out large succalent plants which look well at the time and yet will not stand the winter. A plot of groand ahould be chosen as the site of the meed-bede that is well exposed to ana and air, and the land ahould be well tilled bat not over-manared unless it is known to be impoverished. Having dag and levelled, and trampled the land evenly all over, and raked off the atones, mark out the beds and sow the seeds very thinly broadcast if it is intended to transplant atraight from the beds. Perhaps a better way is to 00 w the meed moderately thickly, and prick out into other beds when the plants have made two pair of true leaves. Very early sowing and large plants result in the Cabbage bolting in the apring. Last season out of a bed of some thousands none bolted, and nearly every one withatood the frost, bat they were netted to protect them from the ravages of the wood-pigeons directiy the now melted down aufficiently to allow the pigeons to reach them. Ellam's Early is excellent for firt catting, and the Heartwell Early Marrow, Batternea and Enfield Market are all good varieties of Cahbage Seeds of all these were sown here on Jaly 29, A good planting of Ronette Coleworta may now be put out for late autumn use.
cauliflowers.-A sowing of Caalifower seed should be made when Cabbage seed in got into the ground. It is prudent to make three sowinga, at intervals of about two weeks. The variety Early London, if it be true, and it is treated properly, it still my favourite all-round Canliflower.
mISCELLANEOU8-Any ground cleared of its summer crops may bo planted with Cottageri' and Asparagus Kales. Purple and White Sprouting Broccoli, and even Brassels Sprouts may be planted where the quantity got in is not deemed equal to the probable demand.

## THER FLOWER GARDISN

By Batiey Wadps. Gardener, Birdsall Gardens, York,
bulbs for autumn plantina continued. -The single and double-flowered Anemones de. serve to bs planted extennively; the ningle varietien are the hardient, earliest, and the more unefal and they may be obtained from the balb dealen in fine mixtures or in named varieties. Some good single-flowered varieties are Masterpiece, scarlet; The Bride, white; Corralea, blue; and Garibaldi, vermilion. The double and single-flowered late varieties have large and brilliant flowers, as have alao the double French Carysanthemam flowered Good varietien of doubles are King of the Scarloter L'Eclair, King of the Blaes, Fea Saperbe, Thalie, Prince de Ligny, Ceres, Admiral Zoutman. Uneful varieties for planting in the herbaceous bordera for flowering in the autumn, are A. japonica, A. ${ }^{\text {j }}$. alba, A. j. elegana, and A. j. Lady Ardilann; and for spring flowering there is nothing brightar or more useful than Anemone fulgens; alao the yellow-wood Anemone, A. ranunculoiden, and the parple and white pasque flower, A. Pulatilla, A, P. albd, and the wood-wind flower, A. nemorona, and ita several varietics; the varieties of A. appeninat A. a. alba, and A. a. rosea. Hepaticas should be grown in every garden ; H. angulosa, H. a. trilobes alba, H. ceerulea, H. rabra flore-pleno, and severa others.
scilla or Squills are amongst the brightent and prettiest of spring-flowering bulba, Scilla sibirica, s. bifolia are the earlient to flower. S. natann, anid other good varietien are later, and all are good for planting in mixed bordern or as edgings to beda 0 other plants.
fritillarias, including Crown Imperial Lillet are showy plants for mized borders. Some of the varieties are tall, others dwarf, and all are atrols growers, bat they do not require much staking. The variegated varieties are very atriking when they do well; but they require good rich loamy soil, and should be planted in patches of 5 balbs. Good varietien are F. Aurora, F. lutea, F. rubra, ald F. ro variegata. Fritillaria Meleagris, having carioud smake'a-head-like blossoma, is of alender habit d growth.

GLADIOLU8 COLVILLEI ALBA is usefal for apinine and eurly summer flowering, and should be planto in the autumn before the corma begin to grom about 4 inches apart or in clamps in the herber ceous border, or in parts of the garden that wer sheltered from the colder winds. The flower apikes are uneful material for catting, eapecislly the variety G. C. rosea. A rich soil suite ghem and the bede or groups should be mulched wim ahort manure daring the winter.

COLCHICUM8.-These bulbs should be largely planted in clamp in the herbaceous border, an the plants flower early, and give brightness to the garden just when it is required. Early varieties are C. Balbocodiam persicam, B. robantum, B. vernam, and B. v. Plantii. The autuma and winter-flowering varieties are also very useful for bordert or rockwork.

CHIONODOXA.-Glory of the Snow is a Scillalike plant that looks well if planted in clumps with other pring-flowering bulbs. C. Lacilix, blue and white, and C. gigantea are good varietie.

## FRUITS UNDFR GLASS.

By Riciard Parker, Gardener, Goodwood, Chichester.
ORCHARD HOUSE.-The portable trees should be removed to a sunny place out-of-doors as anon as the fruits are gathered from them. Bo so doing the wood will become quite matured. The plants must be applied with clear water at the roct, and the foliage syringed at least once a day in bright weather, if the pot can be atood upon a bed of coal ashes, or each on a piece of slate to prevent worms getting into them. Large fruits of Apples or Pears should be aupported by atrip of matting or pieces of open muslin or netting an they approach maturity. Reduce the amount of nutriment supplied to the tree as the fruita approach the ripening stage, but continue to ayringe the foliage up to within a few days of gathering the fruit, and afford plenty of ventilation, 0 an to ensare the proper flevour. If birds or wasp are troublesome, all openings should be covered with light tiffany or canvan. In aome cases it may be necensary to tie some of the foliage back to expose the fruit to the sun.

FIG8.-The main crops of Fige in cool-上ozes now approaching maturity will require abondance of moisture at the roots, and in the air. Continue to pinch the growing shoots at the foarth or fifth leaf, reckoning from the base of auch shoots, retaining maflicient wood for furnishing a crop next season. Ripe fruit should be gathered daily in the early morning, placing them on fresh leaves, and patting them in a cool place, if not connumed forthwith. When the ripe fraits are gathered, the trees should be freely ayringed, doing this leas copiounly if damp weather prevaile, and in that event a slight warmth may be maintained in the heating apparatus at night. Any Fig trees or bashes requiring larger pots should be shifted during August, the roots then having time to take to the new soil before the end of the antumn.

POT VINE8.-Those for early fruiting next year hould have now completed their growth, the rent of the summer being required for the thorough ripening of the canes; and unless thil takes place the Vines will be uselen for early work. The ripening should not be hurried but gradasl, and the plants mast not be deprived of the amount of water required for the healthy development of the wood. They will not require any manarial aids to growth after this date. The foliage of such Vines should be syringed once a day, more air afforded, and in bright weather artificial heat may be dispensed with. By maturing the vines in this manner for a few weeke they will be in a better condition to be atood out of doorn later on.

## THE ORCEID HOUEBS

## By W. H. WHITs, Otehid Grower, Burford, Dorking.

AFFORDING WATER.-The chief work in the Orchid-houses during the rest of the month will consiat of watering and shading the plants, and ventilating the bouses. Owing to the external air having been very dry, I have been obliged in some divisions to depart from my customary rale of netting aside two day in each week for watering the plantr, and have been obliged to examine them every day to ascertain if water at the root was necesaary or not. Some Orchid, namely, Cattleyae and Lælias, do not suffer even if they are allowed to remain dry for a day or two-in fact, apecimen plants that are in very large pote are all the better for being occanionally deprived of water ar that length of time; whilat other apecien, au Cypripediums, Calanthes, Habenarias, Phaius, Bolleas, Pescatoreas, Ditas, and all kinds of plants growing on wood block soon thow aigns of diatresm. I Fould advise cultivators at the present messon to carefally exsmine the plants in the early morning; and in affording water to thone which are dry, let it be aufticient to wet every part, and to rash through the bottom-holes in the pote. Species which do not posmess paendo-balb, viz., Phalænopaic, Aërides,

Saccolabiums, and Vandas, should be watered often enough to keep the sphagnom on the surface fresh and green.

DENDROBIUM8.-Plants of Dendrobiam finishing their growth hould be watered with great care, for if too mach be afforded, they will begin to grow again; but ach late-growing specien as $D$. fimbriatum, D. Brymerianum. D. Phalænopais, D. superbiens, D. taninam, D. Dalhousieanum, D. Pariahii, D. clavatam, D. calceolue, D. albo-manguineam, and the evergreen aection, D. thyraiflorum, D. densifloram, D. savianimum, D. chrysotoxam, D. Farmeri, \&c., should not be allowed ever to get dry till growth is complete.

CYPRIPEDIUM8.-The apecie and varietien of Cypripediam, viz., $C$. insigne, C. Leeanum $x$, C. Spicerianam, C. Charlenworthi, C. Fairieanum, Schlimii, C. Artharianum $\times$, C. barbatum, and other which are inmates of the intermediate-house, may be copiously watered overhead two or three times every week, whether they appear to be dry or not

ODONTOQLO88UM8. -Taking the cool-hone plante as a whole, they should be watered juat often enough to keep the compost moist. The plant of Odontoglossum of the O. crispam, O. Peacatorei, 0 . triumphans, and $O$. lateo-parpareum sections, having bat little to do at this aeason, should not be kept in a saturated condition, or the old roots will decay, snd the new growthe just etarting get noft and weak.

MABDEVALLIA8.-All the Chimæroid Masdevallias require to have their foliage well syringed, and to be frequently watered at the root; whilat those of the Harryana and Veitchil sections ahould be watered only when the compost has become dry. To all housen, except that one in which are the Masdevallias, plenty of air should be afforded, espe cially during the middle hours of the day, when the invide temperature may be allowed to get comparatively dry, damping them down morning and evening The shading should not now be let down quite so soon in the morning a heretofore, and it shoald be withdrawn earlier in the afternoon, in particular in those divisions where the Dendrobiams, Cattleyas, and Mexican Oichid are placed.

## PLANTS UNDHR GLAB8.

By W. H. SmxTh, Gardener, Wat Dean Park, Chichester. POINBETTIA PULCHERRIMA.-Those plants which were the earliest raised from cattings will now bs ready for re-potting, and this time they should go into those pots in which they will flower. In order to ensure dwarf plants, they should be grown at no great distance from the glase, and never allowed to become crowded in their summer quarters. A good mixture of coil consists of loam, leaf-mould, and peat, with a mall quantity of dried cow-dung. After re-potting them, place on a very alight hotbed, atill close to the glass. If this be not arailable, then utiline a low pit into which heat can be turned in weather that is dull or cold. Keep the pit clone until the roots have penetrated the coil, when fresh air must be admitted, gradually at first. Laterstruck plants may also be re-potted, keeping these, however, still on the helves in the atove, ao se to hasten growth a little before putting them into heated pite or framen.

GLOXINIAB (SINNINGIA) gPECIOBA. - Young plants may be re-putted into $48^{\prime}$, or even larger pots if the tabers are large, keeping them in agenial growing temperature, when, if well looked after, they will make good flowering staff for the autumn. The hift afforded them at this date will tend to increase the size of the balbs, and the number of bloom next year. Gloxinias which have done flowering keep a little drier at the roots, and place them in cold frames, with a light ahade over them to prevent corching, and when the leaver have died down place the pots on their siden under the greenhouse or intermediate-houss atage.

PRIMULA 8INENBI8.-Any seedlings now standing in 60's whould be repotted forthwith, and thil time into $48^{\prime} \mathrm{s}$ and $32^{\prime} \mathrm{s}^{\prime}$, uaing good loam, leaf-mould, dry cow manure, with a moderate quantity of and. In performing the operation keep the soil clove up to the collar of the plant, making it moderately firm, and if a plant in not ateady, make it wo with three ahort pegs. Place close to the glass in a cold frame, and afford the plants light shading in sunny weather, keeping close for a few days after potting syringing the frame twice a day when the weather is sunny.

FUCHBIAS apring-ntruck will require repotting and the flowera to be pinched off them till the planta have acquired a good nefal size. They may be placed outaide in half-shade, and well syringed, especially the undersides of the leares, where thrips are apt to lark. Fuchaias treated in this manuer make usefal subject for the conservatory in late antumb.

EABT LOTHIAN INTERMEDIATE STOCKB. - SO a potful or boxful of each, according to needs, of the different coloured varietien for flowering in the spring, and place in a cold frame. A few of each variety may be brought into flower in the latter part of the winter by gently forcing them.

TREE CARNATION8 may be potted, and necared to green painted atick. The firat that were potted will have become eatablished, and may therefore be placed out-of-doors in the full sun, and stood upon, or sunk ap to the rims of the pots in coal-ashes their appearance, the syringe applied twice a day, and water carefully afforded, remembering that planged plants require mach less water than those atood on the aurface. The tree varistien are not nearly so auceptible to diseave as Souvenir de la Malmaison, and the two thould be kept apart

## THE HARDY FRUIT GARDRN By W. Pops, Gardener, Highclere Castle, Newbury.

THE BUMMER PRUNING OF FRUIT TREEB.Attention to the pruning of fruit trees at this seaton in of the firat importance, not only an regards the development of the prement crop of fruit, but of the thoots and frait-apurm. It should be borne in mind that the frait-buds cannot become fally developed without air and light; therefore, the disbudding and thinning of the hoote ahould be well carried out. If a tree is growing very vigoroualy, making a lot of atrong rank wood, and there are no fruit-buds, it is advisable to thin theme growths somewhat severely, in order to admit annlight right up to the base of the remaining hoots, and in a few weeks later, say about the middle of August, give each of the strong shoots a twist aboai 5 or 6 inche from the bane, not breaking them off, but letting the points hang downwards; this will tend to check the flow of asp and cause the back bude to plump up instead of breaking into fresh growth, which might be the case were the shoote cut back in the naal mander. Then, early in September, whilh the leaven are yet on the tree, take out a trench at a diatance of 3 or 4 feet from the stem, and root-prune nuch treen, working underneath the mass of roota, and severing the taproots with a knife. Having done this, fill up the trench with a mixture of tarfy loam taken from the mides of roads, or wach like fresh, gritty material, and charred garden refuse. This will encourage a frenh growth of rootlets before the setting in of cold weather, the tree being pruned at the ordinary winter-praning as rual.
early planting of atrawberries.-Where Strawberries have been layered to afford an early crop of fruit next year, the layers should be planted forthwith. Choo a warm, theltered position for the bed, which will be all the better for being deeply worked and heavily manared. Before proceeding to plant, tread the ground firmly. Ia planting, follow nature, and do not set the layers dri $p$ in the woil. Black Prince, King of the Earlien, \&cc., may be planted 1 foot apart each way for the firt season, each alternate row being taking away when the first crop of fruit is gathered; or they may be planted at 18 inches apart each way in the first inutance, which will be ample room for these rather mall growers for several seasons. Mid-seanon varietien are generally rather stronger grower:, and boald be allowed 2 feet each way, with an extra 6 inchez after every third row an an alley. The upsce between the rows may be utiliaed the frat the earlient crop the old Black Prince is yet hard to beaf, King of the Earlien is a useful early variety, Noble is very early and prolific, and the fruit very large, but it is deficient in flavour ; Vicomteme Héricart de Thury in one of the best varieties for early forcing, and outdoorn. For midmeazon, President and Sir Joweph Pazton are well-tried and atandard varietien. Frogmore Late Pine and Waterloo are good late varieties. Amongat newer onen are Royal Sovereign, which should take the firut place, being of excellent flavour and nice appearance, and it is likely to be grown extensively; Lord Suffield, Gunton Park, and Empress of India are alro of Aratrate quality, and well worthy of a trial.

## EDITORIAL NOTICES.

Advertisementa should be sent to the PUBLISHER.
Fowrpapers,-Correspondents sending reospapers should be careskil to mark the paragraphs they wish the Editor to see.

Local Mews.-Correapondents world greatly obtige by sending to the Editor early intelligence of Looal evonts likely to be of interest to our readers, or of any matters which it is desimable to bring under the notice of horticulturists.

Hustanationg, - The Editor will thantifuly receive and select photographs or drawings, suitable for reproduction in these pages, of gardens, or of remarkable plants, flowers, trees, ct.; but he cannot be responsible for loss or injury.

Lotters for Publication. - $4 l l$ communicutions intended for publication, as well as specimens and plants for naming. should be addressed to the Editor, 41, Wellington stroet, Covent Garden, London. Communications should be whittar or owe side orly or the Paper, ent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but keph as a guarantee of good faith. The Editor does not undertoke to pay for any contributions, or to return unused communications or illustrations, unless by special arrangement.

CORRIVGTED AVERAGE TEMPERATURY YOR THE RNSEUWG WRER, DEDUOED FROM THE OBSKRVATIONS OF FORTY-THREE YEARS, AT OHESWICK.-63.2.

National Rove
Society. Northern exhibitiou at Derby. bition held at Derby on the 17 th inst., and reported on in detail in our last issue. The short and feverish Rose season is now over, for although there may be one or two Rose shows still to be held, the Northern exhibition of the National Rose Society really closes the seation.

The exhibition at Derby was, like those of the two which preceded it, far better than anyone antioipated, yet, upon the whole, not up to the average. It is difficult, and perhapm invidious to make comparisons when the circumstances are so very different, but, on the whole, it may be stated that Glouoester has held the palm for Tea Roses, those at Derby not being so good; while in the case of hybrid perpetuals they were better than at Gloueester, and probably about equal in quality to those at the Cryatal Palace. The lending amateur was asked after the awards were made, whether he thought his stand of thirtyaix was as good as those at the Palaoe; his reply was, "Certainly not!" and yet any one looking st the atand woald wonder where any exception could be taken.
The exhibition was intended to meat the necesaitiee of northern exhibitors, but they are few in number as oompared with those in the south, and henoe one need not be surprised to find so many, even of the chief prizer, being oaptared by southern growers. As might have been expeoted, Mears. Harkness \& Sons came out victorious in the chief olassen, oarrying off the Jubilee Trophy, the Gold Medal, together with the Silver Medal, for the best H. P., and various other prizes; some of their blooms were of first-elass quality,
and the stands altogether were very even in excellence. It is difficult in such stands as these to select those flowers whioh take the first rank, but the blooms of Gustave Piganneau and A. K. Williams, which obtained the Silver Medal, Horace Vernet, Charles Lefebvre, Her Majesty, Rowland Hill, Sazanne-M. Rodocanachi, were of this character. It has been sometimes suggested that seventy-two is too large a number even for nurserymen, because there is always sure to be a certain amount of "tail," but it would have been very diffioult to have pioked out any in Messrs. Harkness' stand which deserved this opprobrious title; there were oertainly none of them to which less than two points could be given, and most of them were worthy of three. Of course, this firm's position in Yorkshire, where the temperature is lower, and the rains have been more frequent, was in their favour, and it was the expectation of everyone that they would carry off the premier awards; they were near home, in itself a great advantage.

Unquestionably the great interest in the show was concentrated in the amateur classes, for there were to be competed for not only the Trophy and Gold Medal offered by the National, but the valuable special prizes offered by the Right Hon. Sir W. V. Harcourt, the prize offered by the Crown Derby Company, and the Piece of Plate offered by the Mayor. The first of these was won by Mr. E. B. LindsRLL of Hitchin, the seoond by Mr. Barker, also of Hitohin; and the third by Mr. Whitton of Bedale, a near neighbour of Messrs. Harkness. The Challenge Trophy and Gold Medal were awarded to Mr. Linnsele, who thus holds the northern and southern trophy. It need hardly be said that the quality of Mr. Lindserci's flowers was very fine; beside those whioh obtained the Silver Medals for the best hybrids and Teas, both of which were in his stand of twenty-four, he had grand blooms of Horace Vernet, A. K. Williams, Count Raimbaud, Her Majesty, Ulrich Brunner, Earl of Dufferin, Catherine Vernet, Sir Rowland Hill (affording a most pleasing contrast by its deep colour to the other flowers in the stand), Marie Baamann, Fisher Holmes, Countess de Nadaillao (Silver Medal), and Alfred Colomb. It will be notioed how many of these were of the rioh high colour varieties, which the Hitchin soil seems to produce so grandly. The second place in these contests was assigned to a northern amateur, Mr. H. V. Machin, of Worksop. His flowers were particularly fine, but wanted in some way the high finish obtained by the Hitohin amateur. Anothur rising amateur has this year made his mark, in the person of Mr. Parker, of Hitchin, and a very exoellent stand of his seoured the Vase given by the Crown Derby Company, a prize which many of those competing would gladly have won. The Major's prize was awarded to Mr. Whirton, of Bedale, Yorkshire, who a couple of years ago carried oft the Jubilee Trophy; his flowers were of good form and excellent colour. Mr. WM. Boyes, of Derby, who has taken infinite pains in organising and carrying out the exhibition, and on whom the chief burden of it rested, waa a successful exhibitor, but not so succeasful as he might have been had he not unselfishly sacrificed his time for the benefit of the Society. Tea Rones, as already said, were not of first-rate quality, although Mr. Buarside again showed what an enthusiastic intelligence can effect under most depressing circumstances. Few men who had witnessed the destruotion of their beat planta by removal and the terrible frosts of last winter, and who had
planted them in March, would have ventured to compete; but difficalties do not deter him, and although his situation is in chilling contrast to that which he enjoyed at Chipping Camden and at Birch, he will not readily relinquish the high position he has held for some years as Tes grower.

The position which Her Majesty took at the beginning of the season has been maintained to the close, the box of twelve exhibited by Messm. Alex. Dickion \& Son, and which carried off the prize for twelve blooms of the best light Roses was truly grand, clearly showing the variability of Rose blooming for Mrs. John Laing, a seedling of the same raiser; the late Mr. Heary Bennett was nowhere seen in such form as last year, although most people consider it a better Rose than Her Majesty; but the same firm was awarded a prize for the best bor of twelve new Roses which, with two exceptions, were flowers of their own raising. Conspicuous amongst them was Mrs. Sharman Crawford and Marchioness of Londonderry, others being Eileen, Con, Shandon, Killarney, Erin-go-bragh, Countess of Caledon, quite nem; Lady Moyra Beanclerk, quite new; and Shangraun, the two which were not their own raising being Captain Hayward and Madame Jula Finger.

There could not be any doubt as to the ercellence of the blooms which obtained the Silver Medals of the National Rose Society in the amatears' olass. Xavier Olibo (H.P.) was a fine bloom of a Rose not often seen in perfection, and to many, probably, the blooms of Horace Vernet and A. K. Williams in the same stand were considered, perhaps, slightly superior toit. The Tes in the same bor, Comtesse de Nadaillac, was a fairly good one; but we have often seen this fine Rose in better condition-s statement whioh might bo made of most of the Tea Roses in the shor. Mesars. Harkness \& Sons' A. K. Williams wh a magnificent flower, of large size and of good colour; while Messrs. Croll \& Sons' Marie vin Houtte was a splendid speoimen of that lovely Tea.

Although no Gold Medal had been awarded at the two previous show, Mesars. Alrx. Dicrsos \& Sons were again successful in obtaining that coveted award at this show, with Helen Kellen, a pink Rose with a slightly purplish tint in it; it is a well built, solid flower, but it is questionable whether if Lady Moyra Besuclerk, another of their flowers, had been exhibited in better form it would not have obtained a higher award than a Card of Commendation.

The colleotions of garden Roses attracted a good deal of attention, especially those exhibited by Mr. H. V. Machin, of Worksop, amonget amateurs, and those of Measri. Paul \& Son, and Messrs. Townsend, amongst nurserymen. In Mr. Machiv's collection there was s large number of the dwarf Polyantha section, whil L'Idéale, Red Damssk, and Camden were well shown. Messrs. Paul \& Son depended more largely on the new exhibition Teas, among which Madame C. Guinoissean, W. Allen Richardsol, Alister, Stella Gray (somewhat in the style of this latter flower), added considerably to the bearty of the stand. In the display of Roses, Mr. H. V. Machin was again first, and his colleotion whs: very fine one, but there is atill a good deal to be done in this class. In one collection there was sin attempt made to break through the dead level monotony usual in such arrangements, basket and vases being used to brealk the level line which is usual in such exhibits; but this colleotion wh spoiled by having two or three exhibition bose with single blooms placed in the front-a for

low vases containing the dwarf Polyanthus would have added considerably to the effect. It is evident that we have very much yet to learn in the æsthetic arrangement of groups of Roseswe call to mind a colleotion exhibited at the Drill Hall some two or three years ago by Mrs. Edward Mawley, of Berkhamsted, from which a good deal might be learned by those aspiring to direct taste in such matters.
It will thas be seen that the projectors of the Derby Show have reason to be satisfied with the result of their appeal to the Rose-growing public; and, although one may assent to the opinion of our ohampion amateur, that this has been a most disappointing season, we may at the same time add, that it was a far better one than the mournful complaints of growers after the hard winter, and again after the lengthened drought, had led us to antioipate-some even of thone who drew these pictares ooming out as if nothing extraordinary had happened to them.

## The Phyllozera <br> A mbeting of the Syndicate of <br> Law. Belgian hortioultarists, and one of special importanoe, is convened at

 the Casino, Ghent, on Angust 4, at 11 A.m., to consider, at the request of the Belgian Government, the question of the desirability of revising the Berne Phylloxera Convention. We have, from the first, protested against the fatility of these regulations, and against the wholly gratuitous injury which has been inflicted, not only on commercial hortioulturists, bat upon amatears desirous of transmitting plants from one country to another.The Italian government has at length proposed a meeting of the nationalities concerned in the Treaty of Berne with a view to obtain the entire abrogation of so much of the oonvention as prevents the circulation of plants other than Vines. This subjeot was informally discussed by as with some of the Italian authorities so long ago as the Florence Botanical Congress, when the absurdity of the regulations was pointed out. This country has never assented to the convention, bat our nurserymen have had, like others, to put up with the verations and impediments uselessly oreated by that treaty. It is surely time they took steps to support their bretbren of Belgiam and Italy. We may fairly look to the authorities at Kew also to lend their potent aid in this mstter.

The generation of botanists that

Charliss Cardale babiegтоу. otany-will -Will his name and his work forgotten. The state of botanical teaching is wonderfully different from what it was when Babington was in his prime, but he retained his Professorship at Cambridge under these altered circumstanoes till his death on the 22nd inst. in his 87 th year, though he had, we believe, long ceased to take any active part in the daties of his offioe. He was of the stock of the Leicestershire Babingtons, but was born at Ludlow in 1808, and educated at St. John's College, Cambridge, where he passed the greater part of his life, aseuming the duties of his Professorship on the death of Profeseor Hrnslow in 1861.

He is best known by his Manual of British Botany, the value of which as a field manual is attested by the fact that it ran through eight or nine editions. In it the "characters" are sharply contrasted, and special prominence is given to those points of most interest and value for clansificatory purposes. Another and most
important oharacteristio of the book is the strenuous effort made to ${ }^{\text {Keep *in }}$ line with the great European floras of Koci and others, and to harmonise the nomenclature of British plants with that in use on the Continent. Babington was very keen in disoriminating slight differences, the value of which has been greatly enhanced since the general acceptance of Darwinian views of evolution. His tendencies in this direction led to his being classed among the "splitters" rather than the "lumpers," by a former generation less appreciative of the significanoe of minute differenoes. Babington's powers of analysis were also prominently shown in his study of British Brambles. He spared no pains in his efforts to disentangle the complications that arise in the stady of these protean plants, and reduce ohaos to order. He seems to have done this parely from the point of view of a systematic botanist without ooncerning himself greatly with the philosophioal deduotions whioh might be drawn from suoh materials. To aid in the disorimination of these plants, Babington oansed a large number of them to be oultivated in the Cambridge Botanic Garden. Not only was he a foremost authority on British plants, but he collected in Iceland and published his researches into the flora of that island. In addition, he was well known as an antiquary, and was one of the very oldest of our own contributors, though, of late years, we have had little ir nothing from his pen. In social and private life, Professor Babington was one of the best and most amiable of men.

The Turnip-Fly.-From the Board of Agriculture we have received a pamphlet treating of the Tarnip-lly or lea (Phyllotreta nemorum), and of the best methode of coping with the peat. This ly is really a beetle, amall in size, but capable, when found in numbers, of destroying rapidy entire crops of Tarnips or Swedes. In view of this, and of the enormous expense entailed by lossen on so large a scale, many methods of preventing the acourge are suggented. Amonget these are the sowing of Tarnipseed on a "stale farrow;" selecting vigorous, healthy seed ; extirpating anch weeds an Charlock and other Crucifers which encourage the beetles; and, in some cases, wowing Mastard with the other need, an the former, germinating first, is devoured by them in preference. Droaght is found to be more favoarable to the beetle than in moisture of atmosphere and soil. Where the Tarnip-fly already exitsts, the proposed remedien are drentinga of noot, lime, paraffin, and other detergenta ; lightly rolling the ground, or pushing over it a "light wide framework apon wheels with well-tarred boards fastened upon it, ao as to come juat over the Tarnip planta;" in this case the beetlea, being dieturbed, jump into the tar, upon which they soon accumalate in masees, and can be acraped off, and the boards re-tarred.
tomato Duke of Yoak.-Mearra. Fellowba \& Ryder of Orpington have aubmitted specimens of new Tomato ander this name. The frait is of medium or large size, handsome, aymmetrical, of rich crimson-red colour, deep flesh, and full, alightly acid flavour. We presame the habit is good, and that it is a good cropper, an Mesirn. Fillows \& Ryder inform ua they have eeventy houses devoted to its cultivation. While there are so many Tomatos of good quality, it is difficult to exprese an opinion, but in this case we have no henitation in aaying that, judging frum the sample sent to as, this is a first-claws variety. Its merite wore recognived by the award of a Firrt-clase Certificate from the Royal Horticultural Society on Tuenday last.
"Pharmaceutical journal"-Thin journal hat always been remarkable for ite efforte to forward the scientific development of Pharmacy. Ite weekly nambers sapply a condensed but accurate ammary of acientific work in chemistry and botany. Quite recently a fourth serien has been commenced, and
the size of the journal increased to quarto size. Everyone interested in sach mattera mant aympathise with the unceasing endeavours on the part of the Society to place pharmacy on a proper beair.

Scottish horticultural Abbociation.-A paper was read before the Ansociation on the 2ad inst., by Mr. M. Chapyan, Esater Daddingaton, Portobello, on the "Gardens of Antiquity." Mr. Cespmas paneed in review the gardens of Babylon, Egypt, Persia, Greece, and pointed out the principal causea of the great progrens of horticulture in modern timen.

St. John's Horticultural Show.-The St. John's (Ipawich) Cottagera and Gardenern' Horticaltaral Society held their annaal show of flowers, fruit, and regetables on Wedneaday, Jaly 17, in the grounde of Mr. K. Bond (one of the vice-presidente), who had kindly placed them at the disposal of the Committee. In comparison with previoun years, the exhibite were well up to the average, bat, owing to the time of the year, were perhap not quite no numerous. The prize list wa divided into three clames-cottagera, gardeners, and amatenrs-and in addition, numeroas special prizen were offered.

The Jerbey Potato Crop.-The winter of 1894-95 was, we learn from a correnpondent, keenly felt in the Channel Ioland, and for the third year in sacceasion a large quantity of reed Potatom was deatroyed by the front. The lone of quite a fourth part of their Potato aead by this caune was nothing less than a calamity to the Jerney farmers. Moreover, the frost was so protracted, that planting was delayed for quite a month beyond the uaual time. In the early dietricte, planting did not commence until the aecond week in March, whereas at the ame date in 1894 the young plants were showing well above the ground. The growth this year was alao slower owing to the greater coldness of the aill; and it was a general complaint that the Potato field showed various "miases," oxing, no doabt, to the planting of weed which had been injared by the froat, and which failed to germinate. The outlook from the firat was therefore far from promising, and continued dry weather threatened general disatter. The early diatricts, an a matter of fact, fared very poorly ; their yield was extremely light, and only for a very few weeks did prices continue at all remanerative. On the heavy lands, on the other hand, the tubern benefited greatly from a downpour on Whit-Sanday, and a heary crop made amends, to some extent, for bad returna. Very soon, however, after the commencement of the English new Potato meason, price in Jerney fell to a ruinons figare. It it estimated that the value of the Potato exported from Jeraey has this year not exceeded $£ 300,000$, whereas it reached almost $£ 500,000$ in 1894.

Clove Carnationa, Stockr, and Zinniab in the Embankment Gardenb, Charing Cross.-The firat of thene have thoroughly established their fame here an hardy town flowert, flouriohing in the midat of amoke. Manses of them in flower are pictures of vigorous health now in thene gardena, and their handtome and fragrant flowers cannot fail to evoke warm admiration. The Stocks are even more charming as bedding planta, their fine mawive baild and great floriferoumens, added to the variety of colour and fragrance, making them moat denirable aubjecta, especially when planted in good numbers together. The dwarf atrain of Zinnia elegans afford quantities of brilliant, telling shades of colour ; they are, moreover, very lasting, if not permitted to bear weed.
horticultural Meeting at Ghent.-At the Ghent meeting on Jaly 9 , the following awards were made:-Certificaton of Merit par acclamation, to M. Jours Hre, for twenty apecimens of Cattioya Mondeli, Mowize and gigat, all choice varieties, notable for the size aud coloaring of their flowera; to M. Kyyla, for Pheenix humilis, an excellent variety of P. eenegalenais, leaves light bluish, a good market plant if eoede of it could be imported; to M. Joles Hxe, for Cattleya Arnoldiana $\times$, a fine hybrid botween Lelia purpurata anã Cattleya

Waracewiczi, lately obtained by Mentr. Sander. Certificates of Merit (à l'unanimité) were allotted to M. Jouss Hye for Cypripedium Youngi, which has long petals, quite covered with preat black apots, exactly resembling those of C . Veitchi, whence this fine hybrid was raised; to M. Pynaert for a hybrid Cypripediam between C. Stonei and Spicerianam, the parentage was plainly shown, the new acquivition is very free-flowering, and easy of cultivation. Certifcates of Merit were given to M. L. De Smet Devivier, for Pteris longifolia, Marildii, the fronds elegantly cat, the colour very diatinct from that of other Ferns, a noteworthy variety for growing on a large scale ; to M. Jotes Hyz for Odontoglossam Wilkeanum ; to M. Petrice for Echmes falgens major, a seedling from the old and popalar Æchmea falgens, bat the bracta are mach larger than in the type, and the colouring is brighter ; to M. Peracer, also, for Tillandsia Sieboldiana, a variety atill very rare, and remarkable for its fine branching raceme covered with rosy-blue flowers or bracta. Certificates for Cultivation were awarded to M. Joles de Coce for Angrecum sesquipedale with twenty flowera and buds; to M. Jules Hye for Cattleya Monsize var. alba Wagneri, bearing twelve well-expanded flower: to M. L. De Smet-Duvivier for Promeræa citrina with very numeroar, mall, golden yellow flowera ; to M. Szewezir for Saintpaulia ionantha, with fifty lovely blue flowera; to M. Pynaert, for Cienkowakia (Kæmpferia) Kirki, an intereating greenhouse plant, the flowers anfortanately are ephemeral, bat recall in aize, form, and colouring thone of the beautifal Miltonia vexillaria. A Certificate for good cultivation was allotted to M . $\mathrm{De}_{\mathrm{E}}$ Sust-Duvivise, for a aplendid apecimen of Adiantum Laddemannianum, a variety reputed to be very difficalt to cultivate, bat this example was a strong and fine plant, with a hundred characteriatic and joung fronds. Thunia Marshallisna may also be mentioned, with twelve well-opened white flowera and thrse imported apecimens of Cypripedinm Cartisin, quite dintinct varietiey, of which the one named magnificum is the mont noteworthy. Ch. de B.

Potatos Cultivated in Jadoo Fibre.We have been allowed to wee some Potato tabers and tops which were grown in Colonel Trowson's Jadoo Fibre. Without giving an opinion on the naefulness or otherwise of the fibre named as medium for growing Potator, we are atill enabled to allege that the Potato had a nice clean appearance, free from wartiness and scabbinens, and they were weighty for their size.

Conatantine Flower Show.-We learn from the Western Mercury that amidat the duat and din of politics in the Truro-Helaton Divison, Conutantine Flower Show came as a welcome relief on Wednenday, the 17 th inst. The attendance was large, though the dimensions of the show were on this occasion cartailed by the excluaion of a poaltry department. During an existence of five years the Society has done much to promote interent in horticulture in the district it embracen, and this year's dipplay is each section was worthy of high
encomiams.

Cut Flowers. - An Anociation has been formed in Holland to endeavoar to put a stop to the exportation of flowera cat from balbe grown in that country. As this custom seriously interferea with the alle of cut flowere and bulbs in the London and provincial markets, it is felt by many of the principal Eaglish growers and bulb merchants that the time hae arrived when stops should be taken to suppress this syatem by supporting the Datch Association. A meeting will be beld at the Hummum': Hotel, Covent Garden, on Friday next, July 26 , at 8 p.m. C. H. M. A. Acdidson, Hox,
Sec. (pro tem.)

National horticultural Society of France. - We noticed, asys our Paris correspondent, at the last meeting of the Orchid cocomittee a new and interesting Stanhopea raised from seed. Hybrid

Stanhopean are atill extremely scarce. Up to the present we have heard only of Stanhopea Spindleriana, raised by Mr. Webeb, gardener to Mr. Spindler, Berlin (S. oculata $\times$ S. tigrina). The new gain is a cross between S. insignis (Frost), and S. ocalata (Lindley), and was shown by the fortanate raiser, Mr. Mantin, president of the committee, at Oivet, Orleana. This plant, S. Bellserensis $\times$ (Mantin), is exactly intermadiate between its two parents; the flower is pale yellow atriped with brown. The fertiliation took place in April, 1880, and the seed-pod ripened in April, 1889; the first Hower opened June, 1891 ; three plantu baving already flowered are alike. S. Bellaerens:s $\times$ obtained a First-

Univerbity extension College, Reading.The awarding examiners in the Agricultaral Examinations held under the authority of the 0 ford and Reading Joint Committee have inaned the following pass list: Certificate in Agricaltare, John Francis Adams; Dairy Teacher's Certificate, Jane Foater; Diploma in Agricaltare, first year's examination, passed in all subjecte, Thomas Edward Gunter, Laston Price Richard, and Charles William Thorp; passed in all subjecta except biology, Clande Reginald Powell; paneed in, all sabjects except chemistry and physics, Edmard, Thomas Brown; passed in biology and geolog. Eric Dowson; passed in geology, Clement Hagh Weston Malet. The following were the examinera: -Profensor E. B. Poulton, F.R.S.; Professor A. H. Green, F.R.S. ; Mr. D. A. Gilchrist, B.Sc.; Mr. A. F. M. Drace, Mr. W. A. Glasson, M.A. ; Profenor J. W. Axe, Mr. E. Brown, Mr. W. W. Fisher, M.A.; and Mr. H. N. Dickson.

## CORRIDOR AT MR. W. BULL'S <br> NURSERY, KING'S ROAD, CHELSEA.

[Sge Supplementary Illustration.]
Those of our readers who for reasong of businem or pleasure have ever visited Mr. Bull's establishment for the sale of new plante, will have remarked the tastefuily constructed range of buildinga that sirts the King's Road. This block consists of a large central show-house well adapted for tree Feran, Pa'ms, Cycads, and similar plants grown chielly for the beanty of their leaves and fronds. It was, homever not bailt for any such purpose, being intended by Messra. Weeks, the original owners and conatructors, in a vinery, in which in great variety of Grapevines were to be cultivated, the fruit being sold in the London market. This was many years ago, in the infancy of commercial Grape growing, long antecedent to the extensive culture of the Grape at we see it now at Rochford's, Ladd's, and elsewhere.
We may be sure it did not remain a vinery aftor coming into the posseasion of Mr. Bull-he had other and more profitable uses for so large a house.
The wings of the range consist of offices and two small lean-to plant houses.
In the rear are a number of apan-roofed housen, in the longest and wident of which Mr. Bull diuplegs in the height of the flowering season a wonderful array of rare and beantitul Orchids. Visitors to this part of the nursery mast needs pass through the large glass house that forms the subject of our illustration, and will have noticed, perhaps only carsorily, the fine species of plants with which it is maily filled, and that give it itm appearance of tropical luxariance.
Near the entrance from the street is a pair of Encephalartos Vroomi of great size, second only to some at Kew. Encephalartos csffra is alro a fine plant. Some specimens of Cycas revoluta have stems two to three feet in height, and perfect crowns of deep green fronde. C. circinalis it found in splendid examples; and the door is fanked by some majestic Draceeal australin of which there are many examples in other parta of the houne. Specimens of the broad-leaved D. a. lineata also figure near the door; it is a very desirable variety for the cool conservatory. The more prominent Palms consist of the gracefal Seaforthia elegans ; S. robusta (Rhopalotstlit Baueri); Archontophoenix Alexandrw, a beantiful and usefal cool hoase species. Arecs sapida, specimens with stem three feet high, and leaves measuring 10 feet in length; Pherix intermedia, P. reclimata and P. rupicola, a mout graceful apecieu. A Chamærops excelas hat a height of 16 feet, and a Corypha australis is almont equally tall. Some fine apecimens of Araucaris excelan were noted; almo Catakidozamia Hopei, a noble looking species. Thin by no mean completes the list of Cycads and palms, but it will enable the reader to form an idea of the larger plants in the houte. Of tree Ferns we remarked apecimens of Dickoonie antarctica, the hardieat apecies, with tall menth
which, together with the fine healthy crown of frond, have a total height of 25 feet. Cyathea Smithi, a beautifal Fern, about 10 feet high.
Two admirable pecimen-probably Cyatheas, which came from the Sandwich Islands, have a rachin covered with a thick brown tomentum, and rachim respectively 2 and 4 feet in height.
The remainder of the plants on the floor of the house consist of smaller furnishing specimen of Aspidistra larida, greenhouse Ferns. Aralias, \&c. Hidden from view at the sides of the house are glans frames filled with Trichomanes and Todeas, including T. Moorei, named after Moore of the Sydney Botanic Gardens; a very attractive filmy from Lord Howe's Island; also T. auperbs, an introduction of $\mathrm{Mr}_{\text {。 }}$ Ball's twenty-five years ago. Those perton who are interested in quaint-looking Cycadaceons plants would find here many plants not to be found in any other nursery in the country, and amongut them an ancient apecimen of Ceratozamia fusco-viridis, a Mexican ppecies introduced about twenty jears ago.

Fig. 21.-busbes of the spinelbss goosebrbry.

## A SPINELESS GOOSEBERRY.

The plants shown in the accompanying illustrations (figs. 20, 21), were exhibited by MM. Letelletier, of Caen, before the Frait Committee on Taesday lant. They are mpineleas varietie obtained from weed. The firat apinelens Gooneberry, according to the Reance Horticole, 1892, p. 180, was obtained an a chance seedling by M. Billard about 1860. About 1884, M. Ed. Lefort sowed the seeds of this variety, from which he obtained a race of spineles varieties, geveral of which are deacribed in the Revue Horticole as above cited. The variety we figure is a dwarf form, very productive, and with the fruit of good flavour. It is the form dencribed and figared by M. Carrière as Madame Edouard Lefort. The varieties are grafted apon Ribes aureum, but the scions soon becomefree. The advantagen of a race of apinelens Gooneberrien need no pointing out.

## Home Correspondenoe.

droberas in scotland.-Mr. Kelly's note on the Sundew ( $p .74$ ) reminds me of the time I was at Attedale, Loch Carron, Rost-shire, being then with the late Lady Brasney. As it was my first viait to the Highlande, the different subjecti growing on the
mountains and on the banks of the barns had an attraction for me. It was there on the monatainside that I saw the Sundews growing wild, and I was so interested in them, not having aeen them before in the wild atate, that the first night her ladyship arrived I dressed the dinner-table with Drosera rotandifolia and D. longifolia, which I found growing together with beatiful coloured clampa of sphagnum-mos. J. Barnard, Mostyn Hall Gardens, Mostyn, N.W.

RAgpberries. - Although the soil of Dover Honse Gardens is light and auceptible to drought, yet must Mr. McLeod have the highest commendation for the aplendid crop of superlative Rapberry, which I aw there a few daye aince. The several row of plants running acrose a broad garden aquare, were all trained to wire trellises, they were of an average from 6 to 7 feet in height, the canes having been only alightly shortened, and they hang with very fine frait from top to the bottom. Superlative is so auperb a variety, that it is quite displacing all others where caltivation is good. As the soil at Dover Houne in natarally so light and porona, as to render Rasperrie fruitfol, it is the rale to fork out a
early at the Aohleaf Kidney. The haulm, being amaller and weaker than that of the trae Aahleaf, led me to sapcose that it would be an even poorer cropper than that variety. which proved, on lidting the crop, to be correct. The taber were about of a size, nice-looking, and fit for the best table, but of not by a long way 0 good an regarde flavour as that prince of Potatos, the Ashleaf. I am anable to und + ratand why anyone should cultivate anch a poor cropping variety, when there is nothing in point of flavour to recommend it. My first trial with it was also my lat; atill, there are cultivators whose verdict differ: from mine, and who say that it is the bent variety that they have. I wonder if their's is the true Mona's Pride, or a variety that merely beara a resemblance to that much raunted Potato. The tuber of the true variety of Mons's Pride is very mach borter in ita longer diameter than the true Ashleaf Kidney or Marjolin of the Freach, being sometimes almost round and lat, and there is no awelling about the eje, as is nearly always met with in the Ashleaf Kidney. With regard to the preparation of early varieties of Potato for early cropping, it may not be withoat ase to mention the practice of the Parisian cultivators. They arrange the tubers eje uppermost as we do on wicker acreens, and keep them in a dry frost-proof place until they are planted. When the time for planting in the open ground arrive (April), the acreens are carried with the tubere apon them on to the groand to be planted, and the tabers are taken from them one by one and planted in the hole or furrows made to receive them. It is not asserted that this is a better method than our own, but at least it hae the merit of being a very handy one for cultivators of large areas of Potator. Moreover, onier are cheaper than boards, of which bozes are made. Mona's Pride Potato gained the 1at prize at the show of the Mancheater and Liverpool Agricultaral Society, held at Birkenhead in October. 1863, and the lat prize at the County Kildare Horticultural Exhibition amme year. It was raised by Mr. Rutledge, Douglan, Isle of Man. $F_{0} \cdot M . F_{\text {. }}$

Referring to mome criticism, a few week: ago, on my reference to the quality of the old Mona' Pride Potato, there muat, of course, be local varia tions. I only called attention to a variety which, in this dietrict, eppears to be the beat of all the earlies, both in crop and quality. T. Fletcher, Grappenhall. Cheshire.

GENTIANA PHLOGIFOLIA,-This is a plant to be recommended to gardenera as being one of the few Gentians which are both ornamental and eapily cultivated. It in a native of the Carpathian Monntains, and owe its name to the anpposed reeemblance of ite narrow lanceolate leaves to those of tome of the herbaceous Phloxes. It is perennial and long-lived. A plant which has remained six or aeven years where I first put it looks no older than it did five years ago, but has about a dozen divaricate stem a foot long, with numeroas terminal ambelp, which will take two montha to flower out, and several axillary amaller umbela, wo that each stem has in all thirty or forty flowers and buda. The flowern are bright blue, nearly an large an those of $G$. eeptemfida, but the stem: are lem lealy. C. Wolley Dod, Edge Hall, Malpas.

MAIZE AND BLACK CURRANTB. - An a matter of local pecaliarities, I may mention that we have here grown Maize over 11 feet high, with cobs $\frac{1}{2} \mathrm{lb}$. Weight each, a record not easy to beat out of Cornwall, and yet many things which grow like weed in other placen, die out with un. What is popularly known an the "bob" in black Currant has been a peat here for many years; we have had to burn all our trees, and import others from the non-infeated diatricta; after all the trouble and expente, I now hear of places where it ia disappearing, or has diappeared entirely. Is this good thing purely local, or is the pent generally dying out ? Thos. Fletcher, Grappenhall, Cheshire. [We fear not.]

THE WATERINQ OF DOQ ROBES OR BRIARB FOR Budding - From almost every quarter the cry grows londer, that the Briars die. And it is not alone or chiefly those that were planted last year. Bat thb death seem even more prevalent among two-year-old plantation, or Briars that mised taking the bud latt eason. These old Briars are almont invariably the atrongent, and this last phrase being interpreted mean the softent wooded and the fallent of crude wap. And euch fat and full-fed tisue, whether of rosenood, froit trees, or aught else, is always the firt victim to be atricken down, severely injured, or killed by front. The majority of Bfiars are exceptionally
late this year owing to heat and lack of rain, and the shoota of many of them to remain too ahort and weak to be fit for badding. There is only one effectual remedy for this, let them be heavily watered, soaking the woil at their roote with riverwater, sewage, or house-alopw, failing heavy raina. I know a great many romarians dread water more than drought among their Rises. I met one auch to-day, who feared that none of his Briars would reach this season, and who aimply returned the aceptic's amilo at my advice of soak them through. Neither need we be much surprised at the slender faith of eo many rocarians in the watering of either Briart or Romes. The work of watering has been so ahamefully scamped in moss cases as to warrant the common verdict that it does more harm than good. Sarface apriakling do so, without doubso Bat wasking of sewage, slops, and soft-water, soon stimulate Briara into budding condition, and have helped many winning bloome with firat prize atand. Rose.
peas and poppies in ruseia.-In Hapgood's Rusian Rambles, p. 115, reference is made to a variety of Pea growing nearly 7 feet high, and producing poda 7 inches long and 3 inchen wide; and of "doable Poppies 6 to 7 feet high, with flowern the size of Presnien, while the pod of the ningle Poppien were 9 inches in circataference." It anything known of thene varieties in England? Thos. Fletcher, Grappenhall.

## Law Notes.

## RE FREDERICK PENDLE.

At the Ipwwich Court of Bankraptcy, held on Thuraday, the 18th inst., before Mr. B. P. Grimaey, Regintrar, the above appeared for pablic examination, The atatement of the debtor (nurweryman, meedsman, and farmer, of Rendham) showed a deficiency of ${ }^{\text {el }} 1490 \mathrm{os} .3 a_{0}$, due to anvecured creditora. In reply to the Official Receiver, Mr. F. Messent, the debtor anid that he was at one time an apprentice to the late Dake of Hamilton's gardener at Easton, and that he afterwarde went home to manage the nursery at Rendham for his father, who was in failing health. Hin father died in 1889, and he carried on the business an one of the executors until April, 1894. The member of the family then arranged that the property should be old; it wat pat up to pablicauction at Sexmundham, and bought by his wife. One of the condition of sale wae that the narsery atock ahould be taken at valuation; and in order to meet thit charge his wife mortgaged the property at the time the bought it. He (the debtor) had nothing to do with this tranaaction, and all he did afterwards wan to manage the property on behalf of his wife. People with whom they dealt, he said, knew the position of affairs, although the invoice was sometimes made out to him, and sometimes to his wife. Finding himaelf in difficulties, the debtor fell into the hande of the advertiaing money-lenders. He borrowed $£ 50$ from the Bedfordihire Loan Com pany at 60 per cent. per annum, to be repaid in monthly instalmente of $£ 43.4 d_{\text {, and the balance in }}$ the following January. An security, he gave a bill of sale on hie goods, or his wife's qoods, although his wife had nothing to do with sigaing it. Four inetalments, amounting to $£ 1613 s .4 d$, had been paid When he fled his petition, and at soon ae the Loan Company heard of his failare they put a man in
poesension, and his goods were mold by auction. The
Loan Company get ant and Loan Company got a nett sum of $£ 5 \overline{6}$ in satisfaction of their claim, and full official chargen were made in reapect of the elling-up tranaction. The Registrar of course, be paid, bat that in an incharges maat, of course, be paid, but that in an intance of this
kind the sheriff's officer, who was employed, had acted quite in a non-official capacity. With reference to the case generally, the Registrar wiid it weemed to be queationable whether the wife of the debtor, and
not the debtor himelf, wam really the responeible purty. More than that, the man had no right to give a bill of anle to the Loan Company on his wife's goods, to that the authority under which her goods
were sold might really be invalid.

The Official Receiver invalid.
pozed this quention had nothing to do with he mp. the Registrar moented.
The examination wue adjourned. Eantern Daily
Press, $19 t h$ inet.

## SOCIETIES.

## ROFAL HORTICOLTURAL.

July 23. - The anal fortnightly meeting of the Sociaty wa held on the above date in the Drill Hall
at Westminster, and the number of exhibita though fewer than we have become accustomed to see at the Spring Meetings was coniderable.
Orchids formed a leas conspicuons feature in regard to quantity than asual, but hardy flowers were again exhbited largely, and there were extensive collections of Sweet Peas. New and rare planta were not wanting, and Firat-class Certificates were awarded by each Committee.
Frait exhibite included large collections of Gooseberries and other miscel'aneous aubjects.

## Floral Committee.

Present: W. Marahall, Esq., in the chair, and Menme. J. Framer, Owen Thomas, H. B. May, H. Herbat, R. Dasn, R. Ofen, G. Stevens, C. J. Salter, W. Bain, J. T. Bennett Por J. D. Pawle, H. J. Jonee,
C. E. Shea, Jas. Walker, H. Cannell, L. Spath, C, C. E. Shea, Jas. Walker, H. Cannell, 'L. Spath, C. Noble, and G. Paul.
A large and comprehensive collection of hardy and perennial flowers was shown by Mr. M. Pritceard, Christchurch, Hants. Conspicuous among these were capital bunches of Potentilla Wm. Rollinson, and the pretty, thoagh less showy, P. Hopwoodiana; large bunches of herbaceous Phlox were good; also several varieties of Perennial Sunflower, Montbretia crocosmixeflora, and others. Platycodon grandiflorum, with its large single blue flowers, was effective; and Scabiosa caucasics, and several Centaureas, were noticed, as was also a remarkably well-fruited spray of sambucas racemosus (Scarletberried Elder) (Silver Bankaian Medal).
Another excellent exhibit of out-of-door flowers was from Messrs. Paul \& Son, The Old Nurseries, Cheshunt. This included flowering sprays of the purple-flowering Asclepiss Cornuti, a fine bunch of Bocconia cordsta, the white Lysimachia clethoides, a good bunch of Heliopsis scabra, large, an orange-coloured variety of great effect in borders; and Eryngium amethystinum was well shown, and some first-rate variaties of herbaceous Phlox, \&c. (Silver Benkeian Medal).
Mesors. CANsELL \& Sons, Swanley, Kent, exhibited a collection of Carnations in light bunches, and representing con-
aiderable variety, many of which were new siderable variety, many of which were new seedlings. Cannell's Scarlat is an especially bright one, Duchess of Portland is a very pretty rose and white-coloured Carnation, and Haidée Falbe, a white flower flaked with rose. Mesers. CANNELL had also some capital sprays of Canne Queen Charlotte (Silver Banksian Medal).
Mesars. R. Wallace \& Co., Colchester, again exhibited a collection of sprays of Lilies. Conspicuous amongst the collection was Liliun chalcedonicum, the very bright sealing-wax coloured species. A First-class Certificate was awarded to L. odorum (L. japonicum Colchesteri). This is a species from Chins, much in the way of L . japonicum Brownii, for which it has been frequently mistaken. The flower is rather larger and thicker than Brownii, has larger anthors, and the interior is cream-coloured instead of white. L. dalmaticura Catani, L. Thunbergianum, Calochortus lutens, C. 1. concolor, C Weedii, figured in Gardeners' Chronicle, August 18, 1894, 1894, fig. 21, were also shown (\$ilver Banksian Medal).
A group of well-grown Achimenes in pots and pans was ghown by Me. W. C. WAIRER, Esq., Percy Lodge, Winchmore Mill, London, N. (gr., Mr. Geo. Craga) (Bronze Bankeian Medal).
J. T. Bewnetr PoE, Reqgoo Holmwood, Cheshant, exhibited three splendidly-grown plants of Campanuls Vidalii. This is a bushy species, and the plants shown had six "or, seven spikes each, the height of which were about 4 feet. Fourteen to seventeen flowers are prod uced upon each spike. Flowers are pendent, about $1 \frac{1}{2}$ inch long, white, with orangecoloured mone in the interior of base (see fig. 19, p. 93). Three vary fine plants of Streptosolen Jamesoni were thown, which had been lifted from the open ground, and several plants of Myrtus communis var. boetica. Violas in pots and sprays of good quality were exhibited by Mr. W. BAxTER, Florist, Woking. Mesers. Paul \& Sor, Cheshunt, exhibited plants in flower of Clematis, Viticolla $\times$ Uniflora, a lilac-coloured variety, and a large plant of the mmall leaved C. flammula rubra marginata. The flowers are also smaall, purple in colour, but the base and centre of each petal ailver. Cannas Comet, Souvenir de Crory, and Mrs. Faudell Phillips were shown in praineworthy atyle by Messrs. Paul. Sweet Peas were
very largely exhibited at this very largely exhibited at this meeting, a collection of very great attractiveness boing staged by Mr. HENRY RCK Ford, Wem, Salop, and others; by The Brockhampton Nurseries, Mr. W. E. Tidy (Manager), and by Messrs, Dobine $\&$ Co., Rothesay, N. B., and Orpington, Kent. Mr. ECKFORD's collection was extensive, and included upwards of 50 bunches. Awards of merit were recommended to Lady Grieel Hamilton, an excellent heliotrope or pale lilac-coloured variety Blanche Burpee. a large flow er of pure white; and Mars, a variety with extra large flowers of rosy purple, very bright and effective. Particularly noticeable amongst a whole lot of
 Venos, flesh tinted with brouze ; Peach Blossona, o soft pink-
coloured flower; Prince Edward of York, crimeon coloured flower; Prince Edwand of Yort, crimson and roee;
Stanley, very dufh purple, and many others (Eilver Flore

Medal). The exhibit from the Brockhampton Nurseries mas
staged amid Maidenhair Ferns, and ivcluded a large of bunches, rather thickly disp sed (Bronze alarge number of bunches, rather thickly disp ssed (Bronze Flora Medal),
Messre. Dobsie had about fifty bunches of bright flowers in Messrs. Dobbie had about fifty bunches of bright flowers in variety (Bronze Flora Medal)
Messrs. PEED \& SOYs, Norwood Road. West Norwood, staged a group of very choice Gloxinias, interspersed with Ferns, \&e. (Bronze Flora Medal)
Messrs. JNo. Laing \&o Sons, Forest Hill, London, S.L, exhibited four large-flowered double Begonias: Mra, Peak, rose; and Mrs. W. J. Bilney, light apncot,
Mr. C. Herrin, gr. to Lady Fortescue, Dropmore, Maidenhead, showed a bunch of a border Carnation named Dropmore Clove, a good dark bloom with non-splitting calyx. 4 Finth class Certificate was awarded to Cardaus eriophorus,
species of Thistle, also shown by Lady Fortescue. This species of Thistle, also shown by Lady Fortescue. This
plant has a very ornamental character, its ohief attrac tion being the large woolly heads that follow the purple species.
From Mr. F. W. Moore, Royal Botanic Garden, Glasnerin, were sprays of Agapanthus minor and A. Mooreana, Crinum Powelli, C. P. alba, and C. yemense, all from the open air. Messrs. Jas. Veltch \& Sons, King's Road, Chelsea, showed
a pretty little groap of their Rhododendron javanico-jasminiflorum hybrids, nice, dwarf, well-flowered plants ; and were a warded a First-class Certificate for Davallia tenuifolia Burkei from New Guinea. This is a very elegant variety, and the fronds are pendent as soon as made. Fora basket it should bs
Sery suitable and pretty in the stove (Silver Banksian Meda). sir Trevor Lawbewce, Bart., Burford, Dorking (gro, Mr. Bain, showed some sprays of Pentstemon hybridus grandiforms from seed sown on January 15, 1895. The blooms and apmys were alike magnificent, and an $\Delta$ ward of Merit was recom-
mended to the strain. Sprays of Salpigloseis in variety, and of excellent merit, were also shown, and a spray of Gladiolns Dutreuil de Rhine was recommended an Award of Merit. The blooms of this were of remarkable size, salmon-scarlet in colour marked slightly with silver.
Mesars. WM. Cutbusi \& Sons, Highgate Nurseries, London, showed some very fine Cockscombs named Cutbush's Giant; and G. A. Fablini, Esq, Forest Hill, exhibited some uberos. rooted Begonias.
Messrs. Webb \& Brand, Saffron Walden, were awarded a Bronze Banksian Medal for fine heads of excellent doublo Hollyhocks; and Messers. SAYDER \& CO., St. Albans, exhibited ane foliage Begonia named Duke of York.
Messits. Vettcie Son, Chelsea, showed sprays of Paria macroetachya, and a collection of Nympheea blooms. A Fintr Clase Certiticate was awarded to N. Marliacea chromatella, and Awards of Merit to rose-coloured varieties of No odorati and N . Leydekerii.
Messrs. T. CRIPps \& Son, Tunbridge Wells, showed some plants of the rare Mutisis decurrens, sometimes called the climbung Gazania. It has excellent orange-coloured flowers Also some flowering shoots of Schubertia grandiflora (Brooze Banksian Medal).
Mr. R. P. Brotherston, Tyninghame, Prestonkirk, sent some vigorous sprays of Germania Carnations. A large doubleHowered yellow Begonia named Marquis of Londonderry, mes shown by B. Armitage, Esq., Hermitage Place, Nortia, Stockton-on-Tees.

## Orchid Committee.

Present: Harry J. Veitch, Enq., in the chair; and Menarn. Jas. OBrien (Secretary), E. Hill, H. J. Cnapman, Sydney Courtauld, De B. Crawahay, T. B, Haywood, W. H. White, W. H. Protheroe, and H. M, Pollet.
Messris. Jas. Veircie \& Son, Royal Ezotic Nursers, King's Road, Chelsea, exhibited Phalsenopsis $\times$ LuddeViolacea (Luddemanniana $\%$, Violacea 9 ), the latest of
the fine hybrids raised and reared by mr. JoHn SkDEN. the fine hybrids raised and reared by Mr. Jorn SkDEM This beautiful hybrid has the wax-like flowers of $P$ equal. The colour is light rosy-purple with narrow wavy closely-set bars of a darker hue across the sepals and petale. The base of the lip is yellow with some reddish markings, the front lobe bright crimson-purple (First-class Certificate). Messth Vertci also again exhibited their singular Dendrobium porphyrogastrum (Dalhousieanum of, Huttonii if), which, ou this occasion bore eeveral apikes of tour and five fiomers, of a pase pinkish-lilac colour (Award of Murit); and Cypripodium $\times$ Carnusianum (Spicerianum ${ }^{\circ}$ Haynalaianum i), Dendro bium glomeratum and Miltonia verillaria superba.
Sir Trevor Lawrence, Bart., Burford, Dorking (growet, Mr. W. H. White), exhibited Haberaria rhodocheila, a pretty species of the H. militaris clase, but with bright green, unspotted leaves, and clear orange-scarlet labellum. The plants shown exhibited very free growth and profuse flowering qualitien (Botanical Certificate); also the pretty and fragrant Epidendrum alatum.
Mesars. F. SANDER \& Co., St. Albans, staged a nolect group of Orchids, in which ware the rare and aingular Angrecum Eichlerianum, a curious species, with fleshy, flatiy-arranged dark-green leaves and large solitary flowers, bearing somest resemblance to those of A. eburneums; the sepals, petial spar, and base of the lip, is pale green, the broad apienlatio front of the lip pure white (Award of Marit); Dendrobium speciosissimam, for which they obtained a Botanical Certio ficate at the last meetiog, but which on this occosion secured an A ward of Merit: Cypripedium Kimballianum, illustrated in the Gardeners' Chrowicle, Jnne 29, p. 801 ; the pretty flowers, with the side-lobes of the lip and tip of the colum
claret-coloured, the flowers having large orbicular apple-green bracts at the base (Botanical Certificate); Brassia Lewisii, Odontoglossum Lindleyanum rar. Sobralia zantholeuca, Odontoglossam Bictonense album, Batemannia Burtii, Cattleya Gaskelliana, Cook's var.; Cirrhopetalum picturatum, some good forms of Dendrobium Phalrenopsis Schroderianum, D. bracteosum, D. b. album, Miltonia vexillaria, and the fine Thite and fragrant Stanhopea Amesiana (Vote of Thanks)
Messrs. HugF Low \& Co., Clapton, also staged a group of Orchids, in which were Dendrobium speciosissimum, and a very fine form of it, with large white flowers, and orange and red base to the lip, the central yellow keel alko having a red spot at its base (Award of Merit); some profusely-flowered Cattleya Leopoldi, C. Rex, C. Eldorado, C. Granulosa, C. Warscewiczii, Lycaste Rossians, Cypripedium Curtisii, Oncidiam Lanceanum, Miltonia Roezlii, two good forms of Lælio Cam $\times$ Schileriana, the singular Vanda Roeblingiana, \&c (Vote of Thanks.)

## (Vote of Thanks.)

Fred. Handy, Esqo, Tyntesfield, Ashton-on-Mersey (gr. Mr. T. 8tafford), showed Cypripedium Godefroyse leucochilum magnificum, with large yellowish flower blotched with purple and fine specimens, each with many spikes, of Miltonia vexillaria rubella and M. v. superba.
J. T. Gabriel, Req.. Palace Road, Streatham Hill (gr., Mr. (. Rawson), showed Cattleya Rex. Messrs. THos. Cripps \& Son, Tunbridge Wells, staged a group of grandly-flowered Diea grandiflora, exhibiting considerable variation in the colour of the flowers, some being orange-scarlet, and in other the crimson hue prevailed. A Silver Banlsian Medal was the plants were cultivated
F. W. Moore, Esq.. Royal Botanical Gardens, Glasnevin, Dublin, sent Bulbophyllum Lobbii var. Colossus; the pretty Maxillina Hubechil, with white flowers like a small M, grandi flore, and purple-tipped (Botanical Certificate); Mormode pardinum (Botanical Certificate); Aêrides Lobbii, and Epiden drum paniculatum.
Walter C. Waleker, Esq.. Percy Lodge, Winchmore Hill gro, Mr. G. Cragg), showed the fringed-lipped and fragrant Lelia Digbyana (Firet-class Certificate), and Oypripedium Godefroyæ. W. O. PAREES, Eeq.. Llanberis, Lower Tooting, exhibited an inflorescence of a good form of Cattleya Warsce wiczil with five flowers.
R. I. Measures, Esq., Cambridge Lodge, Camberwell (gr. Mr. H. J. Chapman), sent Maxillaria ochroleuca and Bulbophyllum Sanderianum. J. Forster Alcock, Esq., Exhims, Northchurch, showed Lelio-Cattleya $\times$ Schilleriana. E. H Woodsin, Eeq., St. Nicholas House, Scarborough (gr , Mr Hoghes), showed Lxelia crispa, Woodall's var. ; and G. H.
Rouls, Esq, Bournemouth, sent cut spikes of Grobya Rows, Esq, Bournemouth, sent cut spikes of Grobys nnown as L. Lacasiana, Oncidium olivaceum, and Polystachy species.

## Fruit Committee.

Present: P. Crowley, Eaq., in the chair; and Mesars. R. Hogg, T. Francis Kivers, Jas. Veitch, Geo. Banyard, G. W. Cammins, T. J. Saltmarah, J. Cheal, W. Farr, A. H. Pearnon, W. Bates, J Wright, C. Herrin, A. Dean, G. H. Sage, H Balderson, F. Q. Lane, Geo. Reynolde, G. Norman, and R. Fife.
Mr. K. Ryder, Orpington, Kent, sent twelve dishes of Tomato Dule of York, a amooth fruit, of excellent quality and weight, and the variety was deservedly recommended a Firat class Certificate.
Mr. J. WALKER, nurseryman, Thame, Oxon, exhibited about fifty dishes of Gooseberries, many of them very well worthy of remark for the quality of the fruits (Silver Banksian Medal)
An extensive and excellent collection of Gooseberries was staged by Messrs. Jıs. Vextch \& Sons, King's Road. Chelses. The berries were rather larger than we should have expected this dry season. Of reds were noticod Dan's Mistake, Conquering Hero, Forester, Rough Red, Slaughterman, Industry, Bollin Hall, Keen's Seedling, Ironmonger (a very good one), Early Red Hairy, Warrington, Red Champagne, Falrender Bey, Lancashire Lad, Napoleon le Grand, Highlander, Crown Bob c. Whites included Hebburn Prolific, Stockwell, King John, Surprise, Alms, Green Overall, Green Laurel, Champagne (good), Hedgehog, Pitmaston Greengage, Green Gascoigne, Bright Venas (very geod), Fearless, Rarly Green Hairy, Tra veller, Queen of Trumps, Keepsake, and many others. Most noticeable among yellow fruits were Leveller, Pretty Boy Trumpeter, Rarly Sulphur, Yellowsmith, Golden Lion Trumpeter, Karly Sulphur, Yellowsmith, Golden Lion, Hue and Cry, Champagne, Garibaldi, and many others
There were eighty dishes of Gooseberrios, and a number There were eighty dishes of Gooseberrios, and a numbe
of sprays to show the crop the bu hes have borne Black Grape, Black Naples, and Lee's Black Prolific Currants were shown, and eleven varieties of Bed Currants, and four varieties of White Currants, Cherries included Late Duke, Morello, Tradescant's Heart, and Bohemia; Black Bigarreau Pears, Doyenné d'Ete, Citron des Carmes, and Jargonelle and Apples, White Juneating, Mr. Gladstone, and Early Red Margaret, were shown. Also some fruits of an early Nectarine, Précoce de Croncels, which had been ripened in a house without heat, and in the same house as Lord Napier, which whe not ripe. The fruit is said to have amall Napier, which whe not ripe. The frait is said to have a small
stone, and has not too much acidity (Silver-git Knightian Stone, and has not too much acidity (Silver-gilt Knightian
Mesars, Letelletter ie FiLs, Caen, France, bhowed two plants of a spineles Gooseberry (Vote of Thanks). See p. 101 and fige. 20, 21.
H. DiwFs, Esq.. Edsmonscote House, Castle Hill, Ealing (gr., Mr. Wickenden), showed a large yellow Tomato named Edsmonscote Favourite.
H. P. Si Urgrs, Teq., Givons Grove, Maidenhead (gr., Mr.

Peters), showed a collection of Gooseberries, including twelv varieties

From Mr. A. Gilbert, gr. to the Marquis of Exeter, Burghley Gardens, Stamford, came some very excellent fruits of Walburton Admirable Peach; and half-a-dozen Cucumbers named Metcalf's Ringleader, a cross between Telegraph and Rochford.
Mr. Carmiciael, 14, Pitt Street, Ediaburgh, sent some seedling Strawberries from crosses between Waterloo with British Queen and Erogmore Late Pine.
Col. Archer Houblon, Welford Park, Newbury (gr., Mr. Chas. Ross), sent fruits of a seedling Cherry of considerable promise.
A basket of excellent Grapes, Madresfield Court, was shown by Messrs. W. E. Welis, Hattonhurst, Hounslow (Silver Banksian Medal).
Seedling Melons were shown by Mr. G. DYEE, Stubton Hall Gardens, Newaris; Earl Pepoy, Syon House, Byentford; and from the Royal Gardens, Frogmore, but no Certificate wes warded at this meeting
Messrs. W. W. Jounsow \& Sov Boston, Lincolnshire, exhi bited a collection of Peas in considerable variety, also bine and pods of a new and large fruited Pea named Boston Unrivalled, and a few long-pod Beans (Silver Banksian Medal)

## Lecture on Carnations

In the afternoon a paper entitled "The Carnation in Scotland," by Mr. P. Brotheraton, Tyninghame, was read by Mr. Jno. Weathera (assistant secretary). Mr. Brotheraton, in commencing bil lecture, remarked that the difference in climate in England and Scotland had some effect on Carnations. Varieties that have fall and large flowers in Eagland are apt to become grose in Scotland, and others auch as Germania are very good in Scotland, and are inclined to be thin in England. One of the most important details to observe in the culture of Carnations in Scotland was to layer the plant early and plant them out as anon aney are ready. A fortnight's delay will spoil the remult. Mr. Brotheraton commenced to layer him plants three week: ago, and they have all been completed about a fortnight mince. The soil in which the layer are to be afterwards planted out should be eufficiently rich without adding any manare. Carnations were never benefited by the addition of fresh manare in the soil. They might be fed, however, daring the growing or flowering season by mulching, or by solutions of auperphosphate of lime, nitrate of coda, \&sc. Soot wae also very beneficial. Thinning was as helpful and as astisfactors in regard to Carnation as any other plants, and the lecturer thought he gained by thinning the flowert, grass, and even flower stems. Shallow planting was insisted apon with emphavis. Mr. Brotherston afterwards gave a list of first-clasa varieties of German, French, and English origin. The lectare with these linth will be printed in the Society's Journal.

## NEWMARKET HORTICULTUEAL

July 11.-This Society made a promising atart, with a show on the Athletic Clab ground on the above date. It in some years since the Society has held a show. The rise and progress of many village societies, and especially perhap the great success of the Mildenhall Society-may have had something to do with the decline and fall of the once flourishing Horticultaral Suciety of Newmarket. Be that a it may, it meeting on Thareday lant was very accesaful, and the entire town seemed en fête for the occamion, reminding one of the earlier shows once so common throughout East Anglia, when the horticultural hows formed in each town and village the great event of the year. Committee of aixteen, two secretaries, the general, H. Atkinson, Eeq., and the entries secretary, W. H. Saville, Esq., the Preident, W. M. Calmont, Esq., of Ciovelely Park, and the Vice-President, Sir George Newnes, Bart, constituted a powerful staff of officers. The realt was a crowded tent of horticultural products of good quality, an well as overflowing quantity, arranged in four divisione, viz., one for plants in pote, and cut flowera. Open: one for Amateura, this one inclading vegetables, plants in pots, and cut flowers: a division for cottagers, alno inclading frait, plants, cut flowers, and vegetables; and lantly, a apecial prize claen, the award being made by various donors.
The revival of this society in a rather unfavourable centre for Roses will, doubtless, give a powerful stimulus to their cultivation. Prizes were offered for collections of nix Fuchsins, and several plants of more or less mprit were staged in compe tition. The committee offered good money prizes for collec tions of six varieties of fruit, and these prizea did much to enrich the exhbition, the 1 st prize being taken by Mr. J Burarss ; the 2nd by the Duke of Mowreost ; and the 3rd by Mr. C. Stevens

Among the chief features of the show was the spirited competition for the best group of plants covering an area of 10 feet by 3 feet, for the Committee's prizes, the Duke of Montrose, being lit, Mr. J. Watrs 2 nd , and Mr. J. Hall 3rd. The juiges also gave several extra prizes in this class, and the Committee an extra apecial 1st to Mr. Burgess, gr. to the Rarl collection, not for competition. The tastefuly-arrangod collection, not for competition. The asme exhibitor alzo furnished some excellent specimen plants for the deco ration of the central table, prominent among which was a fine fre:h plant of Araucaria excelss. He alvo showed a fine collection of fruit. Petunias, Cock's-combs, and Gloxinias. Mr. WATTS, of Newrarket, also supplied some fine plante for the decoration of the central table. Mr. Stevens, of Burwell, and others had also special prizes for fine collections of plante in groups.
Among the more notable exhibitors of cut flowers were Mesars. Dawrels, Norwich, who showod a fine collection of twelve sisgle and twelve doubleflowered tuberous-rooted Begoniss, which the judges highly commended.
Fruit and vegetables, considering the droughty season, and the lightness of the land around Newmarket, were good, and there was quite a prodigality of entries in most of the classes. vegetables having a strong lead. Cooked as well as uncooked
Potatos, bread and honey, were well represented, though the Potatos should be judged whilst hot, and with the use of salt or such cooking tests are of little use
Prizes were awarded for the beat kept and cropped gardeas and allotments.
In reference to Potatos, they seemed all sound and good, though smaller than usual on account of the drought. At Ipswich and several other shows the Duke of York has been the favourite new Potato; but this rough-skinned, curiously spotted, favourite kidney, was conspicuous by its absence from Newmarket.

## SCOTTISH PANSY AND VIOLA ASSOCIATION.

## July 17.-The third meeting of this associa

 tion was held on the above date, in the Religiou Institution Rooms, Glangow. There wat the unal attendance of members. Pansies and Violas were not so numerous, but the quality was far euperior to that of any of the former meetings. List of awards:Certificate of Mexit to fancy Pansy The Baron, exhibited by Mr. S. MCKEE, Belfast. First-class Certificates were a warded to the following flowers: to fancy Pansy Mrs. R. Stewart, exhithe following fiowers: to fancy Pansy Mrso R. Stewart, exhiJeannie R. Karr and Sir John Watson, exhibited by Mr. G McPeerson, Avondale; to fancy Pansy Colonel M. R. G Buchanan, exhibited by Mr. ALEXANDER Lister, Rothemay to faney Paney Frank, exhibited by Mr. Johr 8tewart, Led noxtown ; to fancy Pansy Mrs. Wm. Steele. Violas: Stobhil Gem, Nellie, Liz. Barron, and Jessie Pretswell, exhibited by Mr. Johe Smellie, Bueby: to Viola No. B, exhibited by Mr. John durcan, Eife: to Viola Garryowen, exaibited by Mr. J. D. Stuart, Belfast; to Violas No3. 2, b, and 6, exhibited by Mr. Joher Baxter. Daldowie.

## MANCHESTER ROYAL BOTANICAL ROSE SHOW

Juty 20 -The annexe exhibition houne in the Botanic Gurden looked particularly gay with the great wealth of colour furnished by Roses of every description, by variously-coloured doable Begonias, and by a multitude of berbaceous and other border flowers, all so fresh and beautiful.

## Clet Bloons: Open

Many exhibitors had promised to come forward, but the season in some localities has been inauspiciouc, and they put in no appearance on this occasion. The best bloome of seventy two and thirty-six came from Mess.0. HAN wing and tion. The most striking blooms were among light-coloured varieties, Merveille de Lion, Marchioness of Londonderry, varieties, Merveille de Lion, Marchioness of Litiondiam, Her Mujesty, La France, and Danmark. Amaong high-coloure Roses, mention should be made of A. K. Williams, which variety was superb in nearly every stand; Marie Baumann Madame Rhodocanachi, B. Joubert. Horace Vernet, Abe Grand, Pride of Waitham. very charming rony carmine Beauty of Waltham, Mademoiselle Annie Wood, Proppe Langier, Charles Darwin, Prince Arthur, excellent; Duc de Rohan, very fine ; Gustave Piganseau, and a few of a lighter Rohade, such as Madame Kugene Verdier, Mrs. John Laing and Marie Verdier
For eighteen Teas (three trusses) in the trade classes, Messrs. Prior \& sox, Culchoster, were list in both classes. as also with twelve Teas (single trusses). Among the beat blooms in these two classes were Maréchal Niel, Nipheto Eraest Metz, Mons. Cusin, Marie Van Houtte, F. Kruger, La Boule d'Or, Souvenir de S. A. Prince, one of the moe striking Teas in the exhibition; Madame Hoate, Princess of Wales, Etoile de Lyon. The Bride, Madame Lombard, Innocente Pirols, and Catherine Mermet.
In the Colchester stand was a beantiful bloom of Marie Van Houtte, the pintish-margined petals contrasting well with the soft saffron-imbricated petals in the bud.
In the clase for twelve yellows, Mears. Prior were 1at with Maréchal Niel, Mr. Maytocis lat in that for twelve of an

The bent blooms found in the Amateur classes were Earl Dufferin. Countese of Oxford, A. K. Williams, Gabrielle Luizet, Horace Vernet, Duke of Rdinburgh, Etienne Levet, Charles Lefebree, Dulve of Connaught. Prince Arthur, Victor Hugo, Fisher Holmes, Baronese Rothschild, Ulrich Branner, Countess of Rosebery, Her Majesty. François Michelon, Marie Bauof Ronbery, Her Majesty. François mest of the local stands.

## Miscellaneous Exhibits.

A great additional attraction was the splendid display of cut flowers arranged in poses on a central bed in the arena, exhibited by Mr. Frask Law, the Farm Nurseries, Sale.
Thee consisted of Liliea of various species, chief among which was L. Iongiflorum var. Harrisii, Iceland Poppies, Sweet Peas. Centaress, Gaillardias, Sweet Sultans, Candytufts, Roses, Stocls, Campapulas, Delphiniums, Scarlet Lychnis, and many other things.
Mr. Henry Eckford, Wem, Slorophhire, had ifty varieties in a handred globular glasses of $S$ weet Peas laid out in white, and the foliage of the Peae strewn on the ground cloth was quite $n$ feature in itt way, and no wonder that it commanded the attention of the Queen at the Windsor show, whoee lithographed letter of thanks appeared in the exhibits.
Memars. Dicksoss, Chester, had a very showy group of herbeceaus cot flowers, and their little bonquet Roses. The
double Helianthus muit:florus, with its Anemone-like centre, is attractive. The Geams and Poppies were bright and telling, and the Veronica-like Lyeimachia clethroides, with its drooping spikes and white flowern, were mach admired.
Messrr. PAUL \& Son, Cheshunt, had a nice group of Roses: Her Majesty and J. B. Heywood, as well as the Teas generally, were good. Memors, W. Dickson, Bhown \& Tait had a showy group of cut herbaceova flowers, and Roses; and so also had Mesers. Dickson a Robinson, both of Manchester. Mr. Hemby Brownhill, Sale, had a showy group of miscellaneous border flowers; their yellow and white Marguenites were specially good.

The double Begonias in about 100 varieties, from Messrs. Hartland \& Son, of Cork, from their size and novelty in this neighbourhood, attracted much attention. We may name just a few of the very beat:-Dr. Cuas. Mitehell, Mrs. Lewis Castle, a grand salmon; Madame Lelandier, a fine deep soft rose; Duchess of Fife, best of the light colours; Elsa, quite as large, and not unlite a Lady Bume blush Camellia; Madame Desbois, anemone-flowered: Henri Lavoisin, a fine pink; Major Hope, a pretty carmine.
Mrs. HoDeklws, Withington, obtained an award for dinnertable design, with Rosees and dopending aprays of Asparagus in giasses, set in white embroidered work, resting on a jellow bess.

National Pink Society's Show.
This thow, which wse a limited one, was held in connection with the Rove Show. Few growert were exhibiting, most of the flowers not being in condition
For six pairs of Pinks, Mar. Lond Was 1st, his best being
Bovard, Emily, Empres, of India, and John Lowe. In the smaller clemes, Mr. J. EDw 4 RDS wsa 1st, with Bertha Rovand and Juhn Ball. The best red-laced bloom was Bertha in Mr, Rnward SHafis stand, and the beat purple-laced bloom was Godfrey in Mr. Lord's stand.
The Botanical Gardens are very attactive at present. the bedding-out plaots in the low panels casting a fiae pleasing glow of colour avaid the green grase setting. Mr. BRuce Enduay is looking forward to an ettractive show of Lilies next month, and the month following he means to have an evening garden party anch an given at the Botanic Cardens, London, which is sare to stiract and ensure a large company, Bouth Manchester, should honour it with her preeence.

THE NATIONAL CARNATION AND PICOTEE.
Juxr 24 - The members of thin Society may be congratulated npon the exhibition of the ir favourite flower at the Cryatal Palace on the above date,

Everyone apoke well of the Sydenham Palace an an excellent place for such an exhibition; but many deplored the difficalty in reaching it. It is certain that the whole of the Drill Hall in Jame Street would have been required to eccommodate the numerour exhibits.

Carmations, Cut Blooms. - There were five stands of twentyfour Carnations, bizarres and flakes only, not fewer than twelve
disimilar varieties. Mr. R. Sypenh disimilar varieties. Mr. R. SYDeniam. Tenby Street, Bir blooms, the colours bright, but there was a lack of purity in the white grounde. He had, of scarlet bizarres, Ottello and R. Houlgrave; crimson bizarre, Lord Salisbury, very bright ; pink and purple bizarres, Mrs. Burgin, Sarah Payne, John
Harrison, Wm. Skirving, and Master Fred; parple flakes, George Melville, and Gordon Lewis, rich purple; scarlet fakes, Miss C. Graham, and Sportsman ; rose flakes, Thalia, Cristagalli, and Lady M. Currie. 2nd, $\mathbf{M}$ assrs. THomson \& Co. nurserymen, Birmingbam, whose , P. F. James Douglas, and Warrior; R. F. Thalia; S. F. Mise C. Graham, and 8portsman ; C. B. James MerryWeather, and Manter Ered; S.B. Admiral Curzon, and Robert
Honlgrave. Houlgrave.
There were six exhibitors of twelve blooms, Mr. A. R. Brown, florist, Handsworth, Birmingham, taling the Ist
prize: C.B. Master Fred, J. S. Hedderly, and Madeline; S.B, Lord Salisbury, George, and Othello, intense in colour; P. P. B. Harmony, P. F. Feron, very fine in colour; George Melville and Gordon Lewis, R. F. Thalia, S. F. Miss C. GraMelville and Gordon Lewis, R. H. Thalia, S. F. Miss C. Gra-
ham. 2nd, Mr. Charles Prilifs, Brackell, who had very good P. F. Gordon Lewis and Charles Henwood; S. B. Mars and George, P. P. B. Rifleman, and R. F. Mrs. May. There Hadley Roed, Barnet, being placed lst,
Single blooms, $S, B$. ${ }^{\prime}$. The best, given in the order of their names, were Robert Houlgrave, which took the first four prizes, C. H. Herbert taking the 5th. C. B's., Lord Salisbury, Master
Fred, and J. S. H 3 dderly. P. P. B's. William Skirving took the 1st, 2nd, and 5th prizes; and Sarah Payne, one of the oldest namad Carnations in cultivation, the 3rd and 4th. s. F.'s Sportsman tooly all the five prizes, so well was it shown. P. F.'s Gordon Lewis, Charles Henwood, George their names. R. F.'s John Buxton, Cristi-galli, Boamond, their names. Rody M. Carrie.
The premier Carnation was S. B. Admiral Curzon, probably the oldest named Carnation in cultivation, shown by Mr. M. Rowan.
Picotees. - The best twenty-four blooms in not fewer than fine varieties came also from Mr. R. STDEMHAM in very fine condition indeed, the quality of petal and purity of the grounds being eapecially noticeable. Of Heavy Red Edges, there were Ganymede, John Smith, and Branette; Light
Red E. Lena; Heavy Purple E., Amelia and Mrs. Oppenshaw; Red E. Lens; Heavy Purple E., Amelia and Mrs. Oppenshaw;
light purple E., Mrs. Kingston, Jessie, Somerhill, and Miriam; heavy rose E., Norman Carr, Little Phil, Mrs. Burnett, and Lady Louisa; light rooe E, Favourite, Mrs. Beal, Rose Sydenham. and Mrs. Payne.
There were several stands of twelve blooms, Mr. A. R. Brown being placed let, with capital blooms of H. red E. Brunette and Ne Plus Ultra; H. P.E., Miss Anderson and Miriam; L. P. E, Pride of Leyton, Esther, and Thomas William: H. rose E., Little Phil, Emma Geggie, and Mrs. Rogers; L. roee E., Favourite and Mrs. Burnett.

There were twelve stands of six blooms, Mr, A. W. Jowes, Handsworth, Birmingham, being placed Ist, with H. rose E., Forman Carr: L, rose E., Mrs. Burnett and Favourite; L.P.E., Eather and Favourite; H. red E., Brunette.
Picotees with yellow grounds were both namerously and finely shown, the quality generally being very high. Mr. C. Blick, gr. to Martis R, Smith, Esq., Hiyes, Kent, was lat With superbly grown blooms of Vollaire, Gift, President
Carnot, Golden Eagle, Bemembrance, Mrs. Gooden, Cowslíp, Carnot, Golden Eugle, Remembrance, Mrs. Gooden, Cowslíp, Douglas, and Gladys. 2nd, Mr. C. TURNER, who had differing from the foregoing, Primrose League, Nellie Bath, Koenig Albert, Optimus, Janira, Mrs. Barrett, Florrie Henwood, and Agnes Chambers. 3rd, Mr. J. Douglis, Great Gearies, Iford. There were eighteen stands of six varieties, and very few indeed but deserved a prize; the best stand came from Mr. A. R. Bnown, who had Mrs, Douglas, Mrs, Gooden, Harlequin, Mrs. A. Sydenham, Mrs. Dranfield, and Ladas; 2nd, Mr. W. Spercers, Irat who had distinct from the loregoing, Yellow hammer, Almira, Mrs. Henwood, and Madame Van Hontte.
Singls Bloms.-H. Red E., Bruneste took all five prizes; L. Red E., Thos. William took all the prizes in this section L. P. E., Nymph, Pride of Leyton, Mary, and Baroness Burdett Coutts: E. Bose E., Little Phil and Madeline took the prizes; L. Rose E, Rosie Sydenham, Ethel, and Mrs. Burnett H. Scarlet E., Norman Carr aud Scarlet Queen; L. Scarle E., Favourite took all the prizes; Yellow grounds, Mrs. R. Sydenham took all the leading prizes. The premier Picotee was H Rose E., Mrs. Payne, ehown by Mr. C. Turner.
Self and Farcies.-These were also numerous and very fine. Here Mr. Blick again came to the fore with superb blooms of Dulre of Orleans, yellow; Waterwiteh, Eadoxia, Eldorado Almira, Voltaire, Phobus, Proserpine, Ceree, Mrs. Eric Hambro. Sea Gull, lovely blush variety; Eldorado, Haye's Scarlet, Eraw Lass, pale pinkinh rooe, very five; Shellback, Mive Maud Sullivan, Exile, a deep pink self, of fine quality and May Queen. 2nd, Mr. C. TURNER, who had fine bloome of Germania, King of Scarlets, Roee Oeleotial, Romulua, Prim rose League, 新.
There were seven stands of twenty-four, and fourteen of the lat prize with Cardinal Wolee Mr. R. Sybrnifam tool

Flag; Maud Campbell, Brochans, very distinct; Prince Chamo ing, Ruby, Uncle Tom, Madame Learlier, very distinct, 1 being
broadly edged with ruby-red: and Coranna. 2nd, Mr. Jozu Walken, nurseryman, Thame. There were eleven stands sin blooms, Mr. A. W. Jones takiog the lat prize with Stadtrath Bail, Miss Audrey Campbell, Romulus, Janina Alice Brooks, and Seedling.
were: Germania, Uncle Tom, Miss A. Campbell, and Kina Scarlets. The beat fancies, Primrose Dame and Seedlings.

A class was set apart for bix Caraations and Picoteas for those who hav
taking the lst.
There were several entries in a class for two cut blooms an cut from the plants. Mr. E.C. SHARPIN taking the 1st, with Mrs. E. C. Sharpin, an orange-salmon self, very fine and distinct; unnamed seedlings were also shown.
Carnations in pots.-In the class for twelve plants, Mr. 0 BuIck was lst with superbly-grown and bloomed seadlings from seed sown a year ago, the plants finely grown, some of them carrying thirty and forty blooms, admirable erample of high class culture; Mr. J. DoUGLas was 2nd with plants having five or six blooms.
In the class for a group to fill a space of fifty superficial feet Mr. C. Blick was lst with named varieties of very fin quality, raised at Hayes, white selfs being very good.
In the class for a group to flll 30 feet, Mr. J. D
In the class for a group to fll 30 feet, Mr. J. Dovalus was 1st.
Table Decorations.-There was a class for a dinner-table, arranged for twelve persons, Carnations and Picoteea only, with any foliage, there were six of these, Mr. C. Blick taking the lst prize with a table showing good taste, but very heavy. A
charming arrangement by Mr. J. R. CHARD, Stoke Newington, light and graceful in the extreme, deserved recognition. Vases of Carnations were also shown, and to all appearance the largest flowers found most favour wilh the judges. Sprays and buttonholes of Carnations were heavy, but large flowers being used, such a result was inevitable. Mr. Blicr was Ist with three sprays and also with six buttonh les. Blooms of any Carnation with a single spray of foliage were also showa; one can scarcely help asking for what purpose? as they suggested nothing new in design or use. There whs a clasy for six blooms also.
The Martur-Smith prizer. -The best border variety of self. coloured Carnation, in not fewer than twelve blooms, came frow Mr. J. Doughis, who had a darls maroon self of fine quality; Mr. A. Spurling came 2nd with Paradoz, a scarlet self. Mr. SpURLING had the best six bunches of self-coloured varieties, and Mr. J. Douglas the beat nine bunches of Flake Bizane of fancy varieties.
Certificates of Merit were awarded to H. rose E. Picotee Duchess of York from Mr. C. Turnes, Self Seagull from Mr. C. Butck ; Mrs. Colby Sharpin from Mr. Shareir ; and to Y. G. Picotee Maud, yellow, edged with deep orimsoa, very
fine, and doe not split its calyz, from Mr. F. W. CanMprom, fine, and
Reigste.
Miscellaneous Collections.-These incladed large table of bunches of the newer Sweet Peas from Mr. H. Ecriond, Wem; bunches of hardy flowers from Mr. M. Pritceard, Chriatchurch: a large number of bunches of Carnations from Mesars. H. CANNELI \& Sons, Swanley; bunches of Carne tions, dco, from Mr. T. S. WARE, Tottenham; a fine collec-
tion of hardy flowers from Mr. B. If เDHams, Shirley, sonth ampton; Sweet Peas from Mr. W. E. TidT, Havant; and a nice collection of border Carnations from Mr. Jas. Dougras, Bookham.

## BECKENHAM HORTICULTURAL.

JoLy 24, - The horticultural exhibition, held annually in the Recreation Grounde at Backenham, increasen each year in importance, and the society has now won in a very large degree the patronage and nupport of the people in this neighbourhood, as evidenced by the uncommon number of apecial prize offered. The thow held on Wednenday last was in many rempects highly commendable, and mach praise is due to the energetic and honorary wecretary (Mr. T. W. Thornton) for the life he hat infused into the mociety during the lat three yeara
Groups. -There wore numerous groupe of plants arranged tor effect, some in a conapetition for an open class, and others in a class limited to "singled-handed" gardeners. As a role, the collections in either class were too dense, and showed that an attempt was made to include as many plants in the limitod space as possible. However, this fault is a common one, and in other respects the groups were not open to much criticism. The winner of the lat prize in the open class was Mr. The winner of the lat prizs in the open class was
Croswwell, gr. to W. M. BuLlivant, Esq, Holmewood.
Plaxts.-Many of the plants exhibited wers of superior quality, and very few of the classes lacked competition. The six plants suitable for table decoration, in pots limited to 6 inches in diameter, were, for instance, very commen inhble alchough a greater variety should have been included inotend of showing three Crotons, which, however, were well coloured and good. The exhibitor of these was Mr. Wobstras gr. to E. J. Pristor, Eloq.. Kilsey Park. This oxhibitur
also had three good foliage plants, and was lat, the Caladi he staged being very large and well grown.
The collection of eight miscollaneous plants in 10 -inch poter. for which Mr. J. Munro. gr. to J. L. Buceralx, Eaq., Langlor Court, was list, ware of good quality, though none of varieties were apecially rare. There were clases for one bloom. The award for a foweriag plant was given to a large
well-bloomed specimen of Plumbago capensis, which wa placed before a tolersbly good Anthurium and a Stephanotio floribunda.

Begonias were not very numerous, but the quality of aevera of the exhibits was quite satisfactory. The best four plants of these wore staged by Mr. F. W. Price, gr. to H. C. CrowTHER, Esq., Broadelyot. Fuchsiss, Coleus, Carnations, Dahlias, Petunias, and Boses were exhibited in small quan tity, the quality generally fair, but calling for no special remark. There were several exhibits of very commendable Ferps, and the best four plants were staged by Mr. H. Cooper gr. to C. M. Harrison. Eeq., Whitmores ; and in anothe clase Mr. R. Simmons, gr. to F. H. SIMPSOY, Elsq., Thornbury had three fine plante of Adiantum cuneatum.
Frait.-Though not very extensive, the fruit exhibits represented Grapes, Peaches, Nectarines, Melons, Goosebarries, and Currante. Mr. J. MUNRO was lst for black and for white Grapes, and his bunches were of qood quality, but neither the Glack Grapes nor his Muscats of Alezandria were quiter ripe. The ot her diehes of fruits were generally of very satisfactory The of her dishes of fruits were generally of very satisfactory Gooseberries.
Tegetables were exhibited with considerable spirit in the open clasess in those limited to single-handed gardeners, and in others confined to amatears. First prizes for collections were taken by Mr. Munro and Mr. F.W. Price, and Mr. Webster was lat for a nice collection of salad. Potatos were not of more than average quality in the most cases, and the skins were not very clean. but Beans, Peas, and Turnips were good
Tabls Decorations, \&c.-One of the tents was nearly devoted to these and kindred exhibits, which were more than usually numerous. The winning designs exhibited considerable taste, but call for no special notice. Bouquete and rimilar florista' specialties were numerous; and to instance the desire that exists here to provide classes of interest to as many erhibitors as possible, there were mail-carts decorated with flowers, \&c., the worl of children only; and model designs of gardens and greenhouses were numerous Some of these were good, but such clasees insually bring ezhibits of a very artificial and absurd character bring exhibits of a very artificial and absurd character Amonght some furnished window bores there was one shown
by Mr, F. Snnock, of very superior appearance. Nothing very novel was employed, but it was done well in detail.
Cottagers, and Miscellaneous.-There were twenty clases open only to cottagers. most of them for vegetables. Miscel laneous exhibits included groups of plants and hardy cut flowers from Mesers. Jvo. LiIng \& Sons, Forest Hill ; Crotons and other plants from Mesars. J. Pred \& Sows, Norwood, and excellent group of choice Begonias from Mr. Jwo. R. Box, Croydon; and smaller exhibits from local nurserymen.

## NEWCASTLE - ON - TYNE HORTICULTURAI

Joly 24, 25, 26. -The annual show of this oldestablished society opened on Wedneadsy last Taken throgghout it fully maintained it previously high atandard of excellence. Amonget plant the group are beginning to form an important feature The cut-flower clantes were notable for the grand display of Roses, and also for the aplendid exbibit of hardy herbaceon flowers, whilat Carnations and Pannien were remarkable for good quality. The decorative arrangements, 4 on previou occaaions, were quite up to the average, making collectively a splendid display. Fruit, on the whole, was not as good as last year. It is pleasing to note that vegetable have been included thin year, and it is hoped that this portion of the show will be further extended another year.

## Plants.

The specimen clasess for flowering plants were not so well fillod, a fact to be regretted; for whatever may be said of the value of specimens in any other respecta, it will be conceded that they well exhibit the gardener's cultural akill
Mr. Nicholas, gr, to the Marquis of ZeTLand at UDleatham, was an excellent lst for six different and distinct kinds, howing Dipladenia boliviensis, well flowered, and very haalthy: Allamanda grandiflora, a good all-round plant: hoenocoma prolifera Barnesi, also good; Erica ventricosa Bothwelliana, rather thin, but fresh; Clerodendron fallas, grand specimen, with thirty flower-spikes (this fine autumnal apecies is worthy of more notice), and a well-bloomed Stephanotis floribundm. The next exhibit fell far behind this one.
Mr. Nicholas was also first for six exotic Ferns, showing two grand Davallias, D. fijiensis plumosa fully 6 feet through, and very fresh; and D. tenuifolia Veitchiana, a graceful variety grandly developed; and other good plants were Sadleria Cyathoides, and Dicksonia squarrosa.
Mr. MeIntyre. gr. to Mre. Pease, Darlington, was an excellent first for sir foliage plants, having well-coloured Crotons in C. Queen Victoria and C . angustifolius (the latter in its beat form); also Phoenix rupicola and Cycas siamensie, and a dwarf close-growing form of C. circinalis. Mr. Nichonas Wes a good 2nd, haviog the same varjeties of Crotons, with a fine Kentia Belmoreana.
For three Crotons, Mr. MCIntyee wae also let, showing Colius, Wll wall. Baronne Jawes de Rothechild, and C. anguatiwith sull woll coloured; as well as betug lat for three Draceanas. With well-grown good varieties. He was again let for four The plants, viz., Croton Simitziamus beingione of his beet. The best four. Ferns came from Mr. Jas. Wooder er. to
E. Hopper, Esq., Morpeth, his varieties being Adiantum Farleyense, extra fine; and Thamnopteris australasica, wel developed. Mr. McIntyre followed with smallor examples.
Mr. Wrlam, Cramilington, had the best four flowering plants, his Stephanotis floribunda and Allamanda Hendersoni being well broomed.
Mr. McIntyre was allowed a walk over in the class for a large group of 26 feet by 10 feet, taking the lst prize with an arrangement which was broken up into emaller mounde, the flowering plants being brought, as we considered, too much to the front, otherwise it was effective
Mr. Jıs. Wood was lst for the emaller group, consisting of well-gnown plants arranged on the old sloping model; the 2nd prize going to a thin arrangement from Mr. F. Edmondsor, Green Market, Newcastle-on-Tyne.
Some very good freely-flowered Fuchsias were staged, the most successful exhbitors being Mr. Elliott of Felling and Mr. Ball of High Felling.
The table plants were of good character, but Lilies and Orchids were not shown so well as we expected.

Cum Hers
uality, the size and colour of the blooms Messrs. Harkness \& Son, Bedale and Hitchin, were lat for orty-eight varieties, with a very even and bright exbibit. the best varieties being Her Majesty (extra colour), Alfred Colombe, Comte de Raimbaud, Earl Dufferin, Gustave Pigan eau, and Sénateur Vaisse. Messrs. Cockicr \& Son, Aber deen, were a close 2nd, their best being Gustave Piganneau and Captain Hayward, both extra good.

Mears. Cocker \& Son easily beat the Mesars. Croll \& Sor for thirty-six varieties, showing a superb lot, notable for size, evenness, and colour, there not being one weal bloom amongst them; the best were Comtesse de Ludre, S. M. Rodocanachi, Captain Hayward, Marie Baumann, and A. K. Williems, both extra fine blooms, with Ulrich Brunner (of unusual quality and colour), and Mrs. J. Laing, with Charles Lefebrre. The and prize bor contained fine flowers of Madame Bravy, Victor Hugo, Mrs. J. Laing. and Charles Lefebvre.
For twelve yellow Roses, Messrs, Cboll \& Son, Dundee, were let with Marie Van Houtte, wery fresh, and they were let with twelve varieties of Teas, Perle des Jardins, Innocente with twelve varieties of Teas, Perle
Pirola, and Niphetos being the finest.
Pirola, and Niphetos being the finest.
Mesers. Cockra \& Son were again 1st for twelve of any Mesers. Cocker \& son were again ist ior Majetty, which other section, with immense blooms of Her Majesty, which
although large were not coarse, whilst the form, and even although large were not coarse, Whit
character were all that we could desire.
Mr. Weirton, of Bedale, was the most successful exhibitor amongst the amateurs, taking the lit prize and Bronze Bank sian Medal for eighteen capital blooms, very fresh and even, the best being Duchess of Beaford (extra good), Dr. Andry Baroness de Rothschild, and Alifred Colombe. Mr. Whitton was also lat for twelve varieties and for twelve Teas in another section, again showing in good style.
Mesers. Cockre ot gon ware a spiondid lat for eighteen varieties of hardy herbaceous planta, induding bulbe, the ex varieties of hardy herbacaous planta, indluding bulbe, the ex hibit making a very fine display, the fineet bunches were Alstrocmeria aurantiaca and A. pulchella, Campanula Lactiflora, Enothora Frawori, Chrybanthemum grandiflorum, Lilium suporbum, the latter unuaully rich in colour. Mr. Tios.

BATTEN8BY, Blaydon, came a good second, three of hie beet being Voratrum viride, Epiree palmata, and Aintroemeria a urantiaca
Decorative arrangements.-Here Mours. Pepkixe. Coventry and Leamington, carried oft the chiof bonours, being first for bouquets in two clasees, also firat for a bsiket, and for aprays and button-holes, all of these exhibit being in good tast and in no instance too heavy or excensively large
Mr. Summers, florist, Sunderiand, was a very clope competitor in the class for a hand bouquet, where in addition a bronze Banksian medal wan awarded with the 1st prize, which was won by Messrs. Prerins; the only fault being in the ormer an excess of nize.
The beat Epergne came from Mr. F. Enmornsom, a recher ché arraggement chiefly of Orchids. Mr. J. Battansiny aleo won let prizes for bouquets in the amsteusg classes with superior arrangemente ; whilst Mis Frmonnson was a very ucceosful exhibitor of epergnes and basketa.
Carnations. Picotees and Pinks were mpecially rood, no also were the Pansies. Mr. Oampbrle. Auchinraith, Blantyre faring two leta for the latter (ahow and fancies). In all of these clasees the competition was very keen.

## Fruits.

Mr. McIndoe, gardener to Sir J. Pease, Hutton Hall, Guishorough, was lst for both six and four kinds of fruit, there being no other competitor, the best dishes here were grand ones of Red Magdalen Peaches and Humboldt Nectarines, Transparent Gage Plums, and Black Tartarian Cherries: a large bunch of Bannnas was included. The Grapes were scarcely so good as usual from this exhibitor.
In the single-dish classes, Mr. Mclindore was again successful, taking 1st for a green-flesh Melon with Hich Crows Hybrid, and 1st for a scarlet-flosh variety, with Premier; he being also let with Red Magdalon Peaches: Mr. Nicholas followed very closely with the same variety.
For Nretarines, Mr. McInnoe was 1st again with Humbollt, and for Cherries, with Late Ricarreau.
For four bunches of Grapee, not fewer than two varietien. Mr. J. Mark, gr. to J. C. Arkwriewt. Enq., Clitheroe, Lancabhire, was lst, with fine examplas of Muscat Hamburgh, lerge in berry; and Black Hamburgh, also large-both varieties being well coloured. Mr. Tullett, gr. to Lord BARKArD, Raby Castle, came a good 3nd in this class, his Muscat of Alexandria being the best in the show.
Mr. Hunter, gr. to the Earl of DUrham, Lambton, had the beat Black Hamburghs, fine in bunch and finich. Mp. Jas. WOOD had the ripest and highest-coloured Muscat of Alexandria, but the amallegt bunches; Mr. Mctndor follow. ing, with much finer bunches. Mr. Tillett bad the innest Madreefield Courts; Mr. Molndoe being very close, with finer bunches, scarcoly so ripe
For any other white Mr. Motrnos was enaily lat with wellripened, clearlooking Duke of Bucolenoh.
The Tomato competition was keen, and several splendid dishes were shown, Mr. McIspox agnin ooming in lat with Invincible, apparentiy a good solection of Perfection.

## Miscellaneous Exiibits.

These at Newcastle are very important, and were on the present occasion fally equal to anything before ahown. From Memr. Laing \& Son, Forest Hill, S.E., came a grand disploy of Begonias (tuberous), in the finest varieties of both the singles and doubles now in cultivation. They embraced every shade of colour to be found amonget this section, several of the donbles, notably Mrs. Wateon Armatronk, rich apricot buff; W. Clifford, deep rose; Dowager Emprees Frederick, blush and Lady Wantage, rosy-buff. Some of the newer Caladiam and other plants were included. the Begonias having stood the lons journey in the beat posesible manner.
Mr. Doveras exhibited a choice solection of his seedling Carnations (cut blooms), the best being Waterwitch, Ducheo of Orlasme, a fall primroseyellow: Mrs. Kric Hambro, a pure white, of fine form; Braw Lass, form of Haye's Scariet, deep row colour: Mre. Douglas, sulphur-yellow, roey-pink edge and Cardinal Wolsey, apricot-yellow, edged and flaked bright red.
Messara. F. Fell \& Co., Hexham, showed a moat extensive group of remarkably well-grown Conifera in babkets, \&c. These consisted of specie of Retinorpora, Cupresus. Thuia and Juniperus, with some capital young plante of Picea pungens glauca. Cut hardy flowers were also included
From Mesers. Cocker \& Sons, Aberdeen, came additiona cut hardy flowers, making a great ahow, including several kinds not often seen.
Messrs. Kent \& BEydon had a bright group of Coniferee, with Acers, dc. ; and a somewhat similar exhibit came from Mesars. J. Bobsor \& Boxs, which wat made brighter by well flowered Hydrangea paniculate grandiffora
Mr. J. BIMKENEEAD nhowed a large asocrtment of exotic Ferns, small plants in good character. Violas and Paneiee cane from Mr. A. Pre, Gartang, and other exhibitors. Mr. CUTHBERTEON. Rothesay, had a large assortment of hardy flowers: Mr. Campbell, Blantyre, had Malmaison and other Carnstions, the former of deep colour: Messrs. Lamy a Mateer had Carnations; and from Mr. H. Brownhill, Sale, came a much improved race of the annual Chrysanthemums, specially fue atrain, with larger and finer formed flowers.

## Ghituary.

Mr. T. H. Rabone,-It is with mach regret that we hear of the death, on Saturday last, of Mr. T. H. Kahone, the well-known gardener at Alton Towers. Ia our prevent iusue we can only
reproduce the photograph of the decessed gardener which wan given in the Gardeners' Chronicle on October 14, 1876, in our series of British gardenera, but next week we hope to reprodace a few of the fact concerning his early life, then recorded by himself.

Henri Baillon.-The death of this accomplished and mont energetic botanist is annonaced. He was born in Calais in 1827, and proecuted him atadies in Paris. For many years be acted an Profeasor of Botany at the Faculté de Médicine at Paris, and had the charge of the mall garden belonging to that inatitution. Baillon's activity was traly extraordinary. A Bistoire des Plantes in twelve volumet, a Dictionary of Botany in three volumes, innumerable memoirs and monographe attent his diligence. Nor were these worke mere compilation, they were the renalt of actual comparative investigation and remarkable keen inaight. Few, if any, botaniate of our time had so clear and thorough a knowledge of flowering plante in general as Baillon. He attached great importance to organogeny az a key to deciphering the morphological characteristica and the natural affinities of plantu. A quarrel with Decaisne and Duchartre wat the occavion of a permonal attack on those botanists, which for viralence and persiatency has had no equal in our remembrance, and which led to protests from other botaniats who deplored the anscientific violence of the critic.

## THEPEAT WREK

Tere following summary recond of the weather throughout the British Ialand for the weok ending July 20 , Is faroished
from the Meteorological Onwee:The weather during one:-
st The weather during the early part of the week was five in all the more eactern, central, and southern parta of our Ilands, but changeable and showery in the west and north. After the leth, howevor, unsettled weather apread madually from the weatward over the whole Kingtom, the rainfall of
the 18 th and 19th being in many places very heavy. Thunderstorms occurred in several parts of England on the 19th, and thunder was heard in a few isolated places on the 18th and 20 th.
"The temperature was slightly below the mean in all districte, excepting 'England,E. and So, where it agreed very closely with the normal. The highest readings were observed mostly on the 17 th or 18 th, and ranged from $81^{\circ}$ in 'EnzlanJ, S,' and $78^{\circ}$ in 'England, E..' to $69^{\circ}$ in 'Scotland, N., Ireland, B., and the Channel Islands,' and to $67^{\circ}$ in 'Scotland, W.' The lowest readings occurred at various times in different parts of the country; at one or two stations in ' Scotland, N. and E., and in Ireland, N.;' the thermometer fell elightly below $40^{\circ}$, but in the 'Chan ael Islands' it did not fell slightly below $40^{\circ}$, but in the 'Chanael Islands' it did not
go below $48^{\circ}$, while in 'England, N.W.,' $49^{\circ}$ was the lowest go below $48^{\circ}$, whit
reading reported.

- The rainfall exceeded the mean in all districts, the excess being vory slight in 'Scotland, No, but large over the central and soathern parts of England. In the "Midland Counties and the Chnnnel Islands' the amount recorded was twice as much as the mean.

The bright sunshine was less than the mean in most districts, the deficiency being very large in the Midland Counties." In "Scotland, E., England, N.E., and the Channel Islands,' however, there was a slight excese. The percentage of the possible duration ranged from 16 in 'Scotland, N.,' and 19 in 'Ireland, N.,' to 40 in 'England, $\mathrm{S}_{0}$ ' and to 46 in the 'Channel Islands.'

## MARKET8.

## COVENT GARDEN, July 25.

[We cannot accept any responaibility for the subjoined reporta They are furnished to us regularly every Thursday, by the kindness of several of the principal for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and the demand; and they may fluctuate, not only from day to , but often several times

## SEEDS.

Lonoos : Ju'y 24.-Mesars. John Shav a Sons, Seed Merchants, of Great Maze Pond, Borough, London, S.K.
now an improving demand for Trefoil and Rape, and mon eapecially for Mustard seed; all these three varieties now offer on exceedingly tempting terms. New hoine-grown Bye is coming to market. Full prices are asked for yearling Winte Tares. There is no change in either Peas or Haricots. Bird seeds, at this quiet season, show no fresh feature.

## FRUITS AND VEGETABLES.

Borovari: July 23. - Quotations:-Peas, 2s. 6d, to su per bushel; Onions, 2s. 6d. to 3s. per bag; Horseradish, 1s. to 18. 3d. per bundle; Apples, Tasmanian, 6s, to 8s. per ena Currants, 1s. $9 d$. to $4 s$. per half-sieve; Gooseberries, 1s. 6dit 1s. 9 d. do.
Spitalfields: July 23.-Quotations:- Scarlet Runneme 3s. to 3s. 6d. per bushel; Peas, 2s. to $2 s .6 d$, do. Carrote, $2 s .6 d$. to 3 s . per dozen bunches; Turnips, 2 s . to 2 s . $6 d$. do. Cabbages, 5s. to 6s. per tally; Marrows, $4 s$. to 6s. do. ; Cueum. bers, 2s. to 3s. per dozen.
Stratrord: July 23.-Quotations:-The supply to thit market during the past week has been good, and, with p.enty of buyers, a brisk trade was done as under:-Cabbages, 2s, to 3s. per tally ; Turnips, 2s. to $2 s .6 \%$. per dozen bunches; Carrots, household, 1s. to 2s. per dozen: Mangels, 20s. to 34s. per ton; Onions, Egyptian. 5s. 6d. to 6s. per cwt. ; Bina, Scarlet, 3s. 6d. to $4 s$. per sieve ; do., Broad, 1s. ed. to \%, per bag; Peas, 5s, to 6s. do.; Cherries, 5s. to 6s. per hall. sieve; Berries, $2 s$ s to 3 r . do.; Apples, $2 s$. to $2 s .3 d$. do.; do, $3 s$. 6 d . to 4s. per bushel; Marrows, 68 . to 7s. $6 d$. per tally; Cucumbers, 1s. 6d. to 2s. per dozen; Onions, Ports, 5s. 64, th 6s. per case.

FARringdon: July 25.-Quotations:-Raspberries, 2s. 4 per half-sieve; Gooseberries, 3s. do.; Cherries, 6s. 6d, to is do. : Green Gages, 3s. to 4s. per basket ( 12 lb ); Plom, $2 s$. per box of 10 lb . ; Cucumbers, 7s. 6id. to 8s. per dozen; Cabbages, $3 s$. to $3 s$. 6d. per tally; Carrots, 3s. per dozen bunches; Turnips, do.; Marrows, 2s. 6d. per dozen; Brod Beans, 1s. 6\%. per bushel; Scarlet do., 2s. 6d. do.

## POTATOS.

Borovati : July 23. - Quotations ranged from 80 . th 110s. per ton.

SPITALFIELDS: July 23.- Quotations:-Puritans, 110s, to 120s.: Hebrons (Bedford), 100s. to 120s.; do., Essex, 100. to 110 s.; Suttons' Regents, 100 s. to 120 s. : Yorkshire Hem, 110s. to 120 s. per ton.

STRATFORD: July 23.-Quotations:-Old: 208. to 30s. pur ton. New: Hebrons, 110s.;to 130s.; Kidneys, 100s, to 120 s , Snowdrops, 110 s. to 130 s . per ton.

Farringdon: Ju'y 25.- Quotations: -White Hebrosis 110s. to 120 s. per ton; Red do., 100s. to 110s. do. ; Puritus, 110 s. to 120 s. do.
London Averiges: July 24.-New: Snowdrope, 110s th 120s.: Febrons, 110 s. to 120s.; Early Rose, 110s, to 12 hi Puritan, 120s. to 130s.; Early Regente, 100s. to Illes Jersey, 90 s . to 110s. per ton. Old : Magnums, 40s. to 50m put ton.

## HAY.

Averages.-The following are the averages of the pricu a the principal metropolitan markets during the past week:Clover, prime, 90s. to 115s.; do., inferior, 50s. to 80s.; hyh
 92 s ; and etraw, 20s. to 38s. per load.

## CORN.

Averages. - Official statement of the average pricud British Corn, imperial measure (qr.), for the week endill July 20, and for the corresponding period last year: - 1806 : Wheat, 24s. 4d.: Barley, 18s. 6d.: Oats, 16s. 8d. 1894 Whest, 24s. 6d. : Barley, 19s. 6d.; Oath, 19s. $7 d$.

## Variorum.

The Indian Shot or Canna.-It bae beels atated that the only difference between a weed and a wild flower is, that it is a weed when it comes up where the cultivator does not want it. A wild flowif then, becomes a weed when growing in cultivated ground. One would hardly suppose that the Canti of our gardena, a beautiful wild flower of Florida, is often a great pent to the Floridan horticultarist, and is clasaed there as among the wornt weeds. It nemel it appeara persitently in low ground, known to cultivators as hummock soil; its root-stockg grown deep in the ground, that the plough does not tars them out, so that they grow up as bad as eref in newly-ploagbed ground. The roote have to be def out with a ppade in order to get clear of the Meehans' Monthly" for July.

ENQUIRY.
He that questioneth much shall hearn much."-Bucor.
Elragnos edulis.-Can any reader nay"bow the berries of this plant are made use of, 00 as to be edible? In their natural atate no one would care to taste them more than once. $V$.

- Owing to the large increase in our circutation, we are reluclantly under the necessity of going to press some hours earlier. Our contributors, who well know what this implies, wiil kindly aid us by sending their communications as early in the woek as possible. Communications should rench us not later than Wednesday.
- Plants, Fruits, etc., to ber Named.-Correspondents sending plants or fruits to be named, or asking questions demanding time and research for their solution, must not expect so obtain an answer to their enquiries in the current woek. Specimens should be good ones, carefully packed and numbersd, and not more than six should be sent at one time. Leaves only, or Florists varieties cannot, as a rule be named.
Books: A Subscriber. Grape-growing for Amateurs, by E. Molyneux. London: Upcott Gill, 170, Strand, W.C., price 18.
Brech: E. M. B. The occarrence of laciniated leaves on the Beech is not ancommon. It is an instance of bud-variation, or "sporting"; but Whether it is a reveraion to a former atate of thing, or an adaptation to new circumatances, no one can tell. The Fern-leaved Beechen of garden have originated in this way, the "sport" being grafted on to a Beech atock, and that propagated. Cabnation: $G_{0}$ W. aenda us flowers of Carnation in which the stalks are abruptly bent downwards. We do not know what the cause of the diatortion is, but we sunpect it may be the result of insectpuncture at an early stage of growtb.
Cerysanthemoms Diseased: G. Harwood. The plant are attacked by a minute mite which pancture the young leaves; the fungus Botrytis then settles on the wound and apread.s. Spray thoroaghly, so that the bud are soaked, twice a week, with a deep-red solation of potassic permanganate. G.M.
Diseask in Plum and Prar Trees: T. W. O. Neither cause nor care is known. It is, howover, known that the disease is contagions, therefore all dead treen should be barned, also branches, leaver, and fruit. The application of manures containing ammonia favours the dinease. G. $M$.
Glapr Vines: $G$. W. The disease is certsinly not black-rot, neither is there any evidence of any fungoid disease. Not having the roots ander proper contral is undoubtediy the cause of the leaver and fruit going wrong. G.M.
How Prat beds are Formed: G.F. We cannot do better tban give you the account by Spender in the Transactions of the Bath and West of England Society, of the formation of the peat-bed of Holland. "In the high lands peat is supposed to have been formed by the decay of vegetable life, chiefly that of moss and heather on the aurface of the ground, which forms a mould that increases year by year until it bas undermined the health of the trees, and having caused their fall, gradually covers them over with a yearly-increasing deposit. Ages afterward the trunte are found several feet below the surface of the bed. The foreats protected the growth of the moss and were destroyed by it. In the lower bed peat is formed by the decay of aquatic plante under water, which fall to the bottom and form layer upon layer. These are often found floating on the surface of the water. Floating peat-beds were at one time common in part of Holland, but the modern Datchman, lese aperatitious than the Romans, who were greatly alarmed by the floating foreste of the Zayder Zas, fastens these fugitive parts of hil estate by ropes fixed to staken fixed in more solid earth.
Licher: G.W. W. Phyncis ciliare,
Mealy-bue: M. T. G. G. Should uee the XL All Vaporiser.

Alstromeria aurantiaca.-W. $T$. 1, Cystopteris bulbifera; 2. Pteris chinensis: 3, Aspleniam viviparum.-Campbell. Eupatorium cannabinum.-C. L., Berlin. Specimens all quite withered. 1, Cypripediam, may be bellatalum, or one of the hybrids from that species: 2, Vanda Bensoni ; 3, Vanda hastifera; 4, Dendrobium bicameratum; 5, Dendrobinm sulcatum. These are probably the epecien nent, but the material is so bad that we cannot pledge ourselves to the correctness of some of the names.-H.M Tilia platyphyllos.-No Name. 1, Linaria cymbalaria; 2. Achillea Ptarmica, double-flowered; 3, Galium verum; 4, Linaria valgaris; 5, Echium valgare. -G. A. 1, Clitores Ternatea; 2, A variety of Lathyrus sativus, often erroneously called Lord Anzon's Pea.-A. F. 1, Acer Negundo variegatum; 2, Taxue baccata Var.; 3 and 4, Juniperu. virginiapa: 5, Betula; 6, Picea excelas var.J. B. J. A Viola, oo far an we can make out from auch a poor specimen.-G.B. Chryanthemam carinatum.
Pras: A. B. Something in the soil or the manure that has an injurious effect on them. Do other crops affer mimilarly? In some places the grabs of cockchafer and wireworm do much harm to Редт.
Roors: Ross Florence. Rose double Macartney, Marie Leonida.
Test for Lime in the Soil: W. P. Pour some strong sulphuric acid on to a little of the soil in an earthenware vessel, and if effervescence take: place there is lime present.
Tomatos: J. H. B. 1, Carling of the leaf is frequent in some varieties; the lower part of the leaf grows diaproportionately fast, probably from over atimulation. 2, Yes; was not the ammonia in too large proportion to the water? 3, Yea.
Tomatos and tee Bordeaux Mixture: Tompkins \&f A. $K$. The formula has been given in these pages many time before, and we repeat it for your eapecial benefit. We think that every gardener ahould hang a copy of it in his potting-ahed for referenco in case of need:-Copper ulphate, 4 lb .; frenh unslaked lime, 3 lb .; water, 40 gallons. Place 6 gallons of the water in a tab or barrel, and hang in it 4 lb , of pulverised copper sulphate in mome coarne arking. Slake the lime in another veasel, sdding water only as fast as it takes it up, and then ponr together. Enough limeshould be used to neutralise the free acid of the copper, an if this be not done, the foliage will be injured. To tent this, get a pennyworth of yellow prusaiate of potash at the chemist's, and place in a bottle of water. Add a few drope of thie to the Bordearax before it is dilated, and if it turn it brown the lime is deficient, and more lime should be added until the prussiate of potash has no effect. The above formula is a strong a Bordeaux Mixtare can be uted at any time, and if it is strained twice or thrice through canvas, it may be used in sprayers and pumpe without clogging the nozzles. If fangi are not very troublesome, and when everal applications are to be mado at frequent intervals, 50 or even 60 gallons of water may be need. Alway mix the Bordeaux in wooden, earthenware, or brans vemels, and the fitting of the pump, \&c., thould be of brate.
Tomatos Dismasso: Market Gardener. The woil hat nothing to do with it, nor the manure you have employed, although the excentive darap atmosphere which growers maintain in their houses favours the growth of minute fungus. The plant is much wafer in a comparatively dry, warm house than in a moist one. See reply to Tompkins.
Tomatos: $A_{,}$P. B. The beginning of the Black-rot. Cut off all the affected fruits and barn them, dreasing the plants with the Bordeaux Mixture. Can you send specimen of the beetlo which gnawed into the fruit ment?
Varietiles of Fruite for Maristing: Igmoramus. Red Currants: Raby Cantle or Victoria for late, and La Hative for very early nae. Red Datch if a weet, rich frait be wanted; and La Fertile, a
very heavy bearer, and large fruited. Pricen about 20s. per 100 ; pew variaties a little deerer then this. Black Varieties: The Ogden for esply uae, and Lari Biack for general ase. Price about 23s. per 100. Three varietipa of Rapberry: Falataff, large, excellent, red: Baumforth' Seedling. large, prodactive, red, 15s, per 100; Superlative, red, heavp cropper, 258 per 100 . If a yellow variety be grown. choose Yellow Antwerd. or for late use Octnber Yellow. Black or Purple Cooking Plums: Early Rivers, anequalled tor cooking and preserving. The fruit is very heavy, a bathel weighing from 70 to 80 lb ., whereas other varieties eeldom exceed 60 lb . irupe at end of July. Late Prolific, equally productive and good, ripens three weeke later; Wyedsle is a very lact variety, ripening in October. If an early dessert Plam of a dark parple colour is required, choo The Czar; if a late deasert variety, one of the bet to plant is Monarch, which is ripe late in September. Late and early varieties of any kind of fruit pay well. The pricen of etandard of Plama for orchard from $£ 6$ to $£ 7108$. per 100. Dwarf maiden sbout 128 per dozen. Distances at which to plant red Carraute, 6 bs 8 feet apart. Black Currant rather more, say, 10 feet in rich deep soil; and 8 feet in that which is naturally poorer or thallow. Plams 14 feet apart if bushes; 20 feet if atandards. Rasperries, if grown on stools throwing from eight to ten cane each, which will be bent over and tied to atake fixed midway between the stool in the line of the plants, or a trifle more on one side of the line, which is better at 6 feet apart; or they may be planted at $2 \frac{1}{2}$ to 3 feet apart, and the fruiting canes restricted to six, the canes being then made self-sapporting. The best Gooseberry for picking green is Whinham's Industry, or if for gathering when ripe as well, then choose Hielander or Lancashire Lad-price per 100 same as red Currants; distance spart also the aame.
Virgmia Crgeper: E. $M_{\text {. Vitia (Ampelopria) }}$ hederacea. It is aid to have been introduced from Canada or the northern Uaited States in 1629, and was originally called Hedera quinquefolia, under which heading you will find it in Miller's Dictionary. Of courne it is no Ivy, but a Vine.
Vnus: J. W. The abanking in other years was due to the roots having got low down in a border, which, owing to the great length of time that has elapsed aince it was made, bas become in an unwholesome condition. Your partial escape this year from shanked berrie is due to the great amount of anahine having warmed the coil to a greater depth than usual, and caused an excessive amount of tranmpiration from the folinge, and thus preserved, to some extent, a balance between requirement and mupply. You thould examine the border this year an soon as the crop is ripe. catting the buacher and bottling them. If the border is foand to be in bad order, make a new border with fresh woil. \&c, and see that the drainage is well provided for, and the depth of moil does not exceed $2 \frac{1}{3}$ feet, raising the surface above the surronading level, the anboil being clay.

Gardenters' Clironidl.

SATURDAI, AUGUST 3. 180\%.

MUSHROOM SPAWN.
THE feneral public, and even a cood many gardeners, have but misty ideas as to thm mode of growth of Mushrooms. It this is trues with reference to the Mushrooms, it is even m ipt so in regard to the spawn. Those who do know are not always successful in the ${ }^{6} \mathrm{~m}$ mufasture of spawn, and sometimes experience disappointment in the growth of that purchased. I'be gardener has frequently to encounter two evils in Mushroom growing, one uncertainty of poduction, which may arise from bad or dead spawn, but is usually the result of want of care in regulating the temperature of the bed before or during spawning; the other the production of Mushrooms, indeed, but of Mushrosms inter. mixed with other fungi whose presence is $n$ st desirable, and might even be injuriuas. This evidently arises from the use of bad, that is of mixed spawn. The "spawn" represents the roots, stem and branches of a fluwering plant, and it feeds upon decaying animsland vegetsbe matter, being, in fact, what botanists oall a "saprophyte," and not a "parasite" on living plants. When this spawn is placed under suitable conditions of moisture and heat, it absbs food, grows, spreads, and ultimately sends up into the light and air the stalked oaps which represent the fruit or seed-vessel of an ordinary plant.
The would-be " manufacturer" would do well to visit a botanical laboratory where fanzas "cultures "are undertaken, so that he might be able to see and realise what are the conditions under whioh fungi can be grown. "Culture" in a laboratory and oulture for market, though dependent on identioal principles, are necensarily different in detail. A French botanist, for instance, has succeeded in growing Mcsh. rooms on glass-plates with the aid of certain chemical solations, and withont the aid of any manure whatever, the temperature being kept aniform. The advantages of such a procedure in oleanliness, certitude as to the species employed, and regularity of production, would of course be great. At present, however, this is only a laboratory experiment, and as such presents nothing remarkable to the student of fungi. Whether suoh procedures can be talken on commercial lines is another matter, and one that might well be investigated at Chiswick or some other experimental garden. In the meanwhile, we must go oa in the old Wayn, and get the leat spawn we can. The "manufacture" of Mushroom spawn may le looked on as a curious and out of the way sort of industry; but it is a very important one nevertheless, as those who pay a visit to Mr. Johnson's farm at Hanger Hill, near Ealing, may see for themselves.
Mr. Johnton, we may any, from uach an inepection of his land and tiv crope ae Jaily journey through them for some yore past has wableá us to make, is an excellent farmer, and one who apparently doe not approve of grambling and despair as remedies for
agricultural depression. Amongst other thing he bat a herd of 100 or more cows and these repsy the attention bentowed upon them, not only by the milk they yield, but by the aid they afford in the production of virgin nawn. In Mr. Johnton' spawnfactory the bricks have the form of flat tilen 9 inchen by $4 \frac{1}{3}$ inchea. They appear to consist of fine loam mixed with cow-manure and with fragments of pawn interspersed. When mixed, they are spread on the ground in the open air to dry, and then placed on racks in oppn theds. There il mo large a demand for thin spawn, that ono difficalty is occanionally felt in coping with it.

Mr. Johnson tents the value of his spawn by himself growing Mushrooms on a large scale. Long raised mound of manare are formed in the open air, each 32 yards in length, and 2 feet 6 inches in height, and an much through at the base. The degrees of fermentation and heat are, of course, watched, and when the heat has decreased, say to $80-90^{\circ}$, and remains pretty uniform, the beds are "spawned" by the insprtion at intervals of fragments of the bricks 3 inchen zquare. The beds are moistened when necesary, and when the soawn has commenced to run, the beds are then cased with mould about $1 \frac{1}{2}$ or 2 inches thick. and then covered with long litter, beveath which, in about six week, the fangi make their appearance. On the average, we were told, these bed have produced 19 lbs , of Mushroom to the yard. The average price for the year bas been $8 \%$, per lb , or $128.8 d$. a yard. Four ontdoor beds apawned in September last came into bearing a month later, and produced npward of 2000 lb. weight of Mahhrooms by November, some being of extraordinary ize. The weekly average gathering in upward of 700 lb . The beds are so arranged as to ensure a more or lew continuous mpply, one set succeeding another.
"City gentlemen" riding to town every morning by the District Railway from Esling are puzzled to know what can be grown on thowe long monnd of earth, on which nothing green ever seems to make its appearance. We remember that yearm ago a very distinguished butanist, and one by no meana unknown in the gardening world a generation ago, travelling to and from Kew vid Patney, uned to express his wonder in like manner at these myaterions mounds. That they contain buried treasure wo hope we have made apparent.

The three bed shown in the photocraph (fig. 24) produced at this gathering 508 lb . of Mushrooms, or an sverage of 5 the yard.

## New or Noteworthy Plants.

CATTLEYA $\times$ JUNO. Byb. Mav., L. Barron. (C. FORBESI $\times$ C. VELUTINA.)

This hybrid has been raived in the collection of C. G. Roebling of Trenton, N.J., where it was in flower June, 1895. In general appearance the flower may be lisened to that of C. velutina, brightened; the growth reminds one of the other parent ; altogether it in a decided acquisition in a aection but little cultivated. Flowere $3 \frac{1}{3}$ to 4 inches in diameter, borne erect on three-flowered seape, highly fragrant; sepala and petals equal, light yellowish brown, irregularly and apareely apotted with intense rose, andalate, recurved at the apex, flushed rowe at the beve, where they are narrowed lnowt to claw. Lip prominent; median lobeetmiorbicular, white with rich heavy veins of

Fig. 23.-mushboom culture: making tar "spatws.
rose; side lobes wrapped closely over the column, pure white flushed with rose on the margin; yellow-veined in the throat. Leonard Barron.

## The Rosary.

## A WHITE MOSS ROSE.

Mr. Newnbam Brown, of Reigate, has in his aarden a white Moss Rose tree, which twice during this meson has produced a flower ball-white, half-red, all the other: being white The white and red do not melt into each other, but are sharply defined, one petal, in fact, being
half-red, half-white. According to Mr. W. Botting Hemsley, who writes in Nature, there are mend varieties of Rose which "revert" or "sport" in thin manner to the anceatral colnar. The atriped whito mi red "York and Lancater" Rose is an exampla Generally, the proportions of red and white are the anme in any two flowers; but sometimes a pare pinkif not also a pure white-flower is seen. This the veraion is ascribed to an imperfect blending of the parent atock; and as any vegetative bud of aplath is capable of producing any or all of the orgaes of the whole plant, or when detached from the parent plato of similar organism, it follows that in a cross-bred vaition, which is not constant or "日red," any vegetative bed may produce the crose of the parant forms.

Fino 24.--stesmoon celtorv: Gatmmanm The ceot.

## REPORT ON THE CONDITION OF THE FRUIT CROPS.

## [FROM OUR OWN CORRESPONDENTS, AUGUST, 1895.」

The vords "average," "over," or "under," as the case may be, indicate the amount of the crop; and "good," "very good," or "bad," indicate the quality.
The countie; are arranged in numbered groups, to correspond with those adopted in the Weather Reports of the Meteorological Department, and followed in our weekly W eather Tables.
** Fuller comments will be given in the following Number. See also Leading Article on page 128.

# Orghid Notes and Gleanings. 

## ODONTOGLOSSUMS FROM THE HIGHLANDS.

Flowers of Odontoglossam crispum, to the number of filty, and cut from different plants, have been sent by R. Brooman-White, Esq., Arddarroch, Gairlochhead, Dumbartonabire, which afford an idea of the excellence of the atrain which has been imported by bim. While all are of good form, no two are exactly slike, some being pare white with a little red and yellow colouring at the base of the lip and the tip of the column. Sume few have a decided salpharyellow hae, while othere are almont entirely of a pale lilac colour. In all the varying shaden of ground colour, epotting of either brown or parple appears, and in two of the lowers the inner halves of the aegmenta are thickly eprinkled with very amall red-purple dota. The variation in the different flowert is remarkable, and when they are ranged side by aide it appears atill wore evident than would be the case if the plante were viewed as arranged in the Orchid-house. Mr. White ayy of them:-" We have had over 1500 epikes on our O. crispum this year, and not a siogle bad one among them, au I think you will agree when you see the bloom I send, which are a fair sample. From tome canse, however, I do not think them quite up to the atandard of last year, and several ocher growert have made the ame remark about their Odontog'osaums. Ponaibly the protracted hard winter may acconnt for it. We grow our plante on open woodwork stages close up to the glase of the roof, and nothirg could be more atatiafactory."

A very remarkable Cattleya Mendelí with zosepurple petals almont as dark as the lip is also nent. If conatant, it will be a diatinct variety.

## Cyrtopodita Andersoni, R, Br.

This Orchid is a native of Trinidad, and grows in open apaces fullv expoesd to the sun. The fusiform stems are some 2 to 3 feet in height, from which the plaited leave die away after becoming mature. The plant flowere in April and May, from the bave of the growing atem, and produces a scape some 3 feet in height, beariag a panicle of brownith yellow flowers. The centre of the basal lobe of the lip is quite yellow, with a crenulated and brownish margin. It is bent grown in well-drained pota filled with vegetable refues, dried cow-dung, and broken bricks, and requires plenty of water in the growing aeason. Bulletin, Trinidad Botanic Garden.

## The Week's Work.

FRUITB UNDER GLABS.
Ay Houikd Panurr, Gardener, Goodrosod, Chichestor.
THE PINERY.-If arrangemente have been made, as recently advised, an to bottom-heat, \&cc., for atarting a freah atock of planta, the nuckers may be potted forthwith, so that they mas become eatablished in the pots before the end of the sutamn. The auckern should be twisted off the old atool, and a few of the lower leaves atripped off, no as to expoue
about 1 inch of the stepe. A saitable size of pot is one of 6 inches in diameter. This size will be large enough for most suckers, though very strong ones
 never be used, and the drainage should be good. Place the anckers low down in the pots, and make the oil very firm about them. The loam ased ahould contain a fair amount of aharp-sand or grit, ite presence favouring the formation of roots. Pionge the pote up to the rim in a bed of Oak-lpaves or tan, having a bottom heat of from $85^{\circ}$ to $90^{\circ}$, and if the plunging material be moisiened by syringing its auface once or twice a day, and the air is also kupt muint, the suckers will require but little water before they have made roots. A slight dewing of the leaves on bright afternoon will aetist the suckers in forming roots. The hoone should be shaded in the middle houre of the day in anny weather, but, as a rule, shading should not be mach afforded. The auckera will not need to be mach ventilated; atill, a certain amount wiil be required by them on very hot days. The tomperature at night may be kept at abont $70^{\circ}$. Pianta of the Queen variety intended fur fruiting in Jave, 1896, should now be in full growth, and will require to be regolarly E fforded tepid water, and once a week a mild manurial aid to growth. The planta should not be wach shaded, and what shading is ased should be of very thin material; moreover, a fair amount of air shou'd be admitted, so as to ensure a stardy plant. Those plants on which fruits are swelling, but which have not began to ripen, may have manure-water occaainually, and a briak temperature with a moiat air afforded them.
strawberries.-The recent rains have greatly sasisted ronting of the runners, and when it in seen that a nofficient number are well rooted, no time ahould be lost in placing them in the pots in which they are to bear frait. The moil used should be a rich turfy losm, enriched by a one-third addition of decajed stable manure; and the pots should be clean onew, with a fair amount of drainage material carefully laid-in and covered with a handful of the fibry lumpe of the loam. The potting should be done firmly, uning a rammer, wo as to get as much wil into the pote as ponible, but leaving sufficient space for water. Place them in a partially shady place for a week, then remove them to one fully exposed to sunahine. They may atand close together for a time, affording them more and more apace an the crown of leaver grown.

TOMATO日.-The batch of Tomato plants for affording winter fruit ahould be forthwith placea in their fruiting-pots, and atood in a manny position. If a disused Melon-house can be devoted to them, they may be planted out in the old bedr, abundant ventilation being afforded.

## THE FLOWMR GARDEN.

By Barhey Wadns, Gardaner, Birdeall Gardens, Pork.
ranunculua abiaticua.- For making a late diaplay in the spring garden, the Ranunculus is a a late plant, the flowers lasting a long time in good condition. Many of them are fragrant, and all are useful for catting. The plants require a rich soll, and to
be planted in sheltered situations. The dosbloflowered Freach Tarbsa varieties have Iarge fown of bright coloura, and they are good growers. Niw varietie are Brutas, Empereur de Maroc, Florina, Grand Master, La Grandease, L. Saltana, L'Etincellante, Lord Macaalay, Mont Blanc, Prince of Walen, Princess of Walea, Queen Victoria, Robert Bram, William III.. Yellow Gem, Yellow Queen. There are also the Doable Persian, Duable Suotch, Duble Tarban or Turkish varieties in fine colours.

BRODIEAB. - These besutiful free-flownim bulbs deserve a place in every garden of apring flowers, being very hardy. The Brodises are anfilil for planting in clumps or bedo, and for catting. Saitable species are congesta, coccines, and volabilis.

LILY BULBS for planting in beds or barden should now be ordered from the florists, autams. planting being the beat for species of Liliam which are bardy. Croceum arantiacam, the comman orange Lily; L davaricum, d, erectum, d. falgidum, d. grandifioram and maltifloram, d, ineom* parabile, $L$ L Tnuabergisnam atrosanguineam, LL pie tum, I Priace of Orange granditioram, Lo Va Houttei, L. candidam, L. Longillurum and tha pariey Harrisii; L. neilgharrense, L. eximinm, L. Mer tagon or Tark's-cap Liliea, in several beantifal varie ties, orange-yellow and scarlet-coloured; Lilias tigrinam and its var. L. Fortunei ; and L. auratan. which in very satiufactory when planted in good rich, well-drained soil in a sheltered situation.

IRI8. -The brilliant varietien of English, Spagith and Pervian Iria, are excellent for planting in baro ders; also Iris reticalata and rubro-coeralen, whon flowers are tragrant, deaerve a prominent place if the bulb garden. Then there are the Gartith Japanese, Sibarian, and other bearaifal variation which are deserving of caltivation.
tianiolas should be grown su "dot"plati" by themselves among other plants, or is clumpa bed.

THE HERBACEOUS BORDER. - The rin mil warmith now prevailiag in this diatrict ( 4 inclad rain aince July 16) are ceasing rapid gromth in kinde of plante, and where tall annual specien planted for the sake of an autumnal diaplay, mon care will be required to preserve the herbeation perennials from injury by over-crowding. alad, ad hould be frequently given to weeding the sec il securing all tall-growing plant to atakel, will caser the fastenings made during the will require easing. Hollyhocks should have ap care in this respect, the stems being apt injured by tight ligatares. Phloxes of thould w growing species, perennial Aatert, \&ce, and flom made secure, and freed from dead leaves a
8HOW VARIETIES OF THE DAHLIA. -The phat cow be making etrong growthe, and regking constant attention in the mattor of are bie fastening will be necesasry. If flowers are mis grown for exbibition more than one required to a plant, in fact, it is prudenb buly allowe to each main shoot, one flower buds be allowed to each shoot, the side shoote and an reduced in number, thowe flower-bads
perfect form being retained. For ahading the flowers bays of light-coloured maslin are the bett. The Dahlia bedt should be heavily malched with short litter, and manure-water afforded once a week. Dwarf, aingle, and double-flowered Dahlias, planted in masees, may be left to grow unrestrained; psovided the bed are copered by them. Trapa must be set forthwith for earwigs, collecting the insects daily

ROSE8.-Piants which were cut down to the ground in the apring have, in many instances, made very atrong growth, and it will be pradeut in exposed gardens to fix them to short atake, with tarred twine or willows. Most of our dwarf Roses that were hard praned, made fine shoots, which flowered well. Keep the Rose-beds tidy by removing spent flowera, cut away thin flowerless, growths, and ahorten back those shoots of H.P.'s which have carried bloom, thas assisting the later blooming of the planta. Teas of strong growth and Roses on walls, hedget, or pillara should be trained so as to keep the shoots from injary by the wind, but should not be tied too atiffly, a certain degree of freedom being farourable to growth. Proceed with the budding of Roaes, and look to the fastening of bude put in come time ago.

## THE ORCHID HOUSES

$B_{y} \mathrm{~W}$. H. WHitr, Orchid Grower, Burford, Dorking.
CYPRIPEDIUM8.-Of late years no Cypripediams have received more attention from our hybridists than the specien C. niveum, C. concolor, C. Godefroyg, and C. bellatulum, and so far as my recollection goes of the croses already obtained, the characteristics of this section invariably predominate in each hybrid. Uf the numerous crosees raised I may mention C. Aylingii, Muriel Hollington, Gertrade Hollington, Tautzianam, Lawrebel, Concolaare, The Pard, Aphrodite, and tessellatam porphyreum. There are cultivators who find the apecien more difficult to manage than most Cypripedium, but as regarda the crosses they, as a rule, conform readily to cultivation, but should any one of them become anhealthy, much patience and clone attention are required to bring them round. Any of these plant that are in need of rooting-space or fresh material in consequence of the old having decayed, should now have attention. As regarda repotting, this should not be done more often than is absolately necessary, because the roots are very brittle in their nature, irequently napping off when disturbed in the least degree. Instead of turning well-rooted Cypripediams out of their pots, break the pot by gently tapping it, and pick out the rotten compont, and if this can be done without disturbing the drainage materials, there will be still lena fear of injaring the roots. Hlace the entire mass in a larger pot, allowing plenty of apace for filling up to twothird of its depth with piece of chalk or limeatone, or failing these, with pieces of tufa, bricke, or thick crocks. The plant should be kept on a level with the rim of the pot, which should be filled ap with good fibrous loam, freely mixed together with the bita of limestone, \&c., and a small quantity of sphagnum-mons. The repotted plants may be placed in a light part of the East Indian house, and shaded with thin acrim at all times. All of the above specien and crossen need water in abundance at all times, especially when in fall growth. Great care id needed to prevent water lodging in the centre of the growthe or in the leaf-axils, where it causes the decay of the leaves; and intead of affording water with a can, it is beat to dip them in a pailful of water, lowering them so as to jast cover the surface of the compost, and allowing them to remain in the water aufficiently long to ensure ataration. Thrips infest the young foliage of Cypripediams, and do mach harm, and the gardener needs to be always on the alert sponging the leaves, but taking care in so doing not to raise them higher than is necesaary, or they will crack.

AERIDES.-Any plante which from exhaution following the production of flowern or other cause havelont ame or all of their lower leaves, may now be lowered in the pots, while those which have lont but a few may have additional drainage afforded, and the cone of aphagnum-mona raised up to the lowermont leaves. Any of the long fleahy aerial roots may be pegged down on to the surface of the mons, which in time they will root into, helping the plants to retain their leaves during the seanon of rest. It is necessary after diaturbing the roots to ahade the plante rather heavily for a time, frequently damping between the pota, and being very careful in affording water. The cool-growiag Aëridea japonicum and Angræcum falcatum thould be kept in the least airy part of the

Odontoglosum-house till the commencement of the winter.

The pretty bright blue Rignchostylia (Saccolabiam) coelestia is a plant that attracts attention whenever exbibited, but it is one that is neldomseen in a flouribing condition, the cause of failure in most cases being that it is grown in too much heat. The Cattleya-house would seem to be the best place for it the whole year. It is now sending up it flower-spikes, and hould be placed near to the roof-glass, aud be thinly maded. Cockroaches often injare the young mpikes; it if, therefore, a good plan to hang it from the roof, or stand it on a pot in the middle of a pan of water.

## PLANTB UNDTER GLAB8.

By W. H. Amith, Gardener, West Dean Park, Chichester.
DUTCH AND OTHER BULBS FOR EARLY FORCINQ.-It is time that bulbe for forcing, if not for planting out-of-doors, thould be obtained from the dealere, remembering that thos who send early are often the beat aerved. If Roman Hyacintha are grown, these bhould be the earliest to place in their pots, the balbs soon beginning to make roots either in or out of the earth, entailing the loss of many root if the potting be deferred. Freesia refracta bas delightfally fragrant flowers, and the ordering of a number of the balbs of this plant ahould not be forgotten. If they are potted early, and consint of continental.grown prodace, they will show flowers much earlier than those which ere of home growth. The soil which suits these, and indeed most other bulbs caltivated in pots and boxea for early flowert, is a friable tarfy loam (oassed through a half-inch nieve), two-thirds; leaf-mould, three-sizths; and dried cow-dang, three-sixtha, with enough silver-and to make the whole porous. Tae aifcings from the loam may be used as a drainage-layer nver the crocks, and in the case of Freesias, Lilies, Brodimap, Ixias, and similar amall bulb, peat may take the place of the cow-dang. Balb potw should be deeper than they are wide.

Chrybanthemums. - The plante must have daily attention, booklog not for black-Ay, which is prevalent this year, duating the ahoots, \&cc., with tobacco-powder at night, and syringing is uff the next morning. Mildew if noticed may be prevented from spreading by the use of flowers-of-sulphur used with a dredger. The fastening of the ahoots must be atteaded to at frequens intervals. Any plant. whose root filled the pots, may be afforded weak soot-water, or a light dressing of Clay's or mome olther fertiliser, but it is not advisable to feed them overmuch until the flower-bads are set.

CINERABIAB. - Continue to re-pot as the sil fills with roots, 32 's and $24^{\prime}$ ' being useful aizes in pots in which to flower them; but if plante larger than ordinary are denired, the main flower-stem, on commencing to rise, should be nipped off, the plants being bilted, and eventally coming iato 16's. If green-ty infesta them, fumigation should be resorted to, or tobacco powder be dusted on the lower sides of the leaves.

MERBACEOUG CALGEOLARIAS.-At thin date another pan may be conn, keeping it rather close and shaded till the seeds have germinated. Tne first sown batch of aeedling thould now be prickedoff into pans or boxes an soon as large enough to be handled, placing them clow to the glass in \& cold frama, affording a slight anount of bade in sunns weather.

CAMPANULA8. - Picked-off seediings may be potted into large 60's, using loam, leaf-mil, cow manare, and asnd. Place outside on coal-athes and afford plenty of water at the root when established, apringiag them frequently in suany weather. Those that are in flower, if of exceptionally good quality, should be placed by.themselve for needing purposes.
geabonable hints.-The boileri and hot-water piper hould be examined for defects, leaks, \&c. Last winter will have severoly tried many heating apparatus, and from the preaent time till the middle of Aagast is a good time for carrying out repairn and renovations. In fact, it in good practice to empty them and clean old and new boilers of nedimentary incruatatione, well washing them out.

## THE KITCHEN GARDGF.

By Josm lambert, Gardener, Powis Carele, Wolshpool.
CELERY.-Where the apace at command will permit of it being dose, some row of the dwarf red or white valieties nowa in May or even later may
be planted. Sach Celery, if not earthed-up much before the winter, will frequently go throagh the winter without much lose, turning in most neefally late in the apring.

TRIPOLI ONION8. - The ground for thir crop may now be prepared, preterence being given to a prece of atiff aroll that is well exposed to the sun. Although ()aions do best in soil which is rather heavy, is should not be waterlogged. Before digging the land, afford it a heavy cont of stable-dung, and some fresh soot at the rate of one pects per aljuare rod; and if it be light make it firm by trampling it evenly and regnlarly all over, doing this when the nurlace is dry. Another dreasing of noot may be raked into the nurface before the drill are drawn. The drills abould not be a less distance apart than 1 foot, or deeper than 1 inch. Having sown the seeds, cover-in the drills, and again tread the land or pasi a light roller over it. Sow about one-half of each variety in the second week in Augut, the other half being kept over for sowing in the latt week. Very larga-growing varieties of Tripoli Onions do not, as a rule, beand our wintera, and a fow varieties need only be grown to meet the home requirements. Nearly ail the socalled "spring ()aions" will withetand the frout of an ordinary winter, and they serva the ame purpose as the Tripoli varieties. Early White Naples, Giant Rocca, and Giant Lamon Rocce, are useful Tripoli Oaions.

8ALADS - A lant sowing of Endive may now be mave, planting out beds in a warm border of earlier raised lindives. Piant out Cos and Cabbage Lettucen at intervals of a week; now Lottuce seeds and tie ap such Cos varieties as may need it. Mustard and Crese, also Land Cress seeds should be sown, not forgettiag a pinch of that of Dandelion.

## THE HARDY RRUIT GARDEN.

## $B_{y}$ W. Pope, Gidener, Highclers Castle, Newbury.

ripening fruit apricots and peaches Trees with ripaning fruice abould be daily examined, and all which with a gentle pull part freely from the siem should be placed in a cool room on ciean white paper. They will keep in good condition for three or tnur days. Peaches show the slightest bruise, needing therefore cartfal handling. It in desirable to place a sheet of wadding or aome fine wood wool under the paper on which these fruit are laid. In most gardens the trees will have to be covered with mualin or hexagon netting when the frait begins to get ripe, fastening it at the edges, so ae to exclude wapp and flies. If ant are troublesome, some means should be devised for their extermination before thia date. They may be trapped by mearing the insidea of a few imall flower-pots with honey or treacle, and laying about in their haunts. These should be examined two or three times a day, and immersed in boiling water for a few minutes. Fresh gaano aprinkled about and over their nests will mometimes canse them to seek fresh quarters, or they may be deatroyed by watering the neats with a fairly atrong solation of soft-soap and petroleum.
outdoor arape vines.-Grape Vinet on walle should now havo all the superflaous nhoote removed entirely, the lateral growthe being pinched at the points as may be necessary to enaure plenty of light being admitted to the principal shoots. The bunches ahould be placed close to the wall, and if they are intended for dessert, the berrie suuld be thinned more or less according to the estting. For winemaking, thinning the berrie will not be necenary. As soon as the iruit commences to ripen, it must be protected from the birde and wasp; the latter are eapecially deatructive to the ripening fruit. Baga made of hexagon or mualin, drawn over the bunchea, will ave them. Earwiga should be trapped with bita of bean-etalks, or flower-pots hung ghout the trees, or laid at the foos, with a little dry mose at the bottom, with boiled Potato or aimilar bait placed under the moas; these baita
being examined every day, and frequently ronewed. Keep \& tharp look out for mildew, and on the first eign of it, dust the Vine with flowers of sulphur.

OPEN FRUIT QUARTER8. - Keep the hoe at work in the fruit quarcers whenever the weather is dry, killing weeds and aërating the noil; bunhes and other carrying heary crop of frait whould be assisted with copious doses of liquid manure; and if a elight mulching of atroog manure be applied beforehand it will prevent the woil being washed away from the roots that are near the surface.

## EDITORIAL NOTICES.

Advartieemente should be aent to the PUBLISHER.
Thistrations. - The Editor will thankfully receive and selec thot photographs of gardens, or of remarkable plants, lowers, trees, pages, of gardens, or of temable for loss or injury.
Lotters for Publication. - All communications intended for publication, as well as specimens and plants for naming, should be addressed to the Editor, 41, Wellington Street Covent Garden London. Communications Sheeh Coveat Garde, LORd, of the paper, should be WRITTEN ON ONE BLDE ONLY OF THE PAPER, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith. The Editor does not undertake to pay for any contributions, or to return unused communications or illustrations, unless by special arrangement.

COLRECTED AVERAGE TEMPERATURE FOR THR RNSU. IsG WEER, DEDUCRD FROM THE OBSERVATIONS OH YOATY-THRER YRABS, AT OHISWICK.-63.

The Fruit
Crops. British Islands has enabled us once more to present a tabular statement indicative of the state of the frait crops in the present season. The wide area involved, and the number of reportera, many of whom have obliged us in this way for many years in sucoesnion, afford guarantees that the report is a olose apprimation to the trath.

Taken as a whole, the report is iningalarly uniform in its character, and decidedly favourable. Apples promise to be abondant in all districts. Pears, unlike last year, are defioient. Plums are a medium crop. Cherrie are, or have been, unusually abundant. To a lers
extent this may also be said of Peaches. Apricots are muoh below average. Small fruits and Strawberries have been very plentiful, with the general exception of Raspberries ; and Nats yield a fair average.
These results may be seen in the following table, showing the number of reoords in each case, and the proportionate numbers of cases in which the yield is of an average oharacter, or over or above the average:-

We must leave it to our meteorological friends to oompare theae reaultg with the olimatal flootuations of the late sutumn, winter, and spring. One thing seems clear, and that is, that the severe weather of early spring had no malign influence on our fruit crops, unless perhaps the deficiency in the Apricots is to be attributed to this canse. It seems also evident that local oon-
ditions are less potent in affecting the genemi result over a large area than olimatal influenom Fruit oulture is extending in this country, and the discussions of the last few years have made it evident that, setting spart the inflated estio mates of some persons, there remains a reasors able prospeot of suocess open to those who know their business, and exercise industry, foresight, and care, without which no business can be profitable. In future issues we shall pablish a series of comments on the frait crops in various dis. tricts, with whioh we have been favoured by our correspondents.
$W_{E}$ are surprised at the greut Streptocarpus. length of time that the specimen of these plants, which Memn. Vritcer \& Sons, Chelsea, exhibited at the Temple Show last May, have remained in blooin, During the period of two months whioh hes elapsed since that show, other varieties of plants, which have some resemblance to them as regand their flower and stature, namely, Gloxinias, have come into flower and passed away; but the Streptocarpus oontinue to make a brave shom, and promise to throw up bloom for soms time longer. It is, therefore, a better "paying" plant for the gardener with a small amount of house-accommodation to grow, if it bo a less beautifal flower than the Gloxinis These self-same plants were wintered in low pis from which the frost on several occasions wis acarcely excluded, but suffered no harm thero from, as their past and present floriforoume amply testifies, whioh is another point in theit favour. Moreover, they have been sucow fally used as bedding plants, and if in dry border and protected by a thick muloh, they might even survive the winter in the opec. Theae pits are at the present time planted nith a generation of seedlings of Streptocarpus, the results of carefully determined orossings of the best of this year's flowering. We may therefore expeot to have disolosed to us in the size, who stanoe, and markings of the flowers some rematr able improvementa on known varieties, machan these latter have hitherto responded to and te warded the efforth of the cross breeders. We my say that the raising of new varietien offers no more difficulties, once a good strain is obtsined, the in the oase of Calcoolaris or Pelargonim the same precautions holding good against wit and ohance fertilisation. The seeds mey sown when ripe, that is, in early autamn, or in the apring-better at the former season. 2 oompost should consist of two-thirds pest, ats third loam, and plenty of sharp sand; sized pot large $60^{\circ}$ or amall 48's, so as not to have tho many plants in a masg together, orowding and other to their detriment; and the draneff very amall crooks placed over one large fant piece to the depth of 1 inoh. The seeds pis minate in moderately warm moist house of pish, The pote, when the seedlings have apporith should be placed on a shelf prettynear to the gricing shading them only from hot sunshine. Priows off may be done at any time daring apring hig summer, with the proper precautions of 1 the plants close and shaded till re-established with other seedling plants, Streptoorpuis shavin not remain in the pots in which the seed way till they get weak and drawn by being and together, but they thould receive timely tion al regards prioking off.

After staying in the prioked-off stage for ' month or sit weeks, they are fit to oome itite "thumbs," and when these are filled with ro into still slightly larger pota, or to be plate
out in beds of soil in pits oapable of being heated when neoessary. If not planted out in this manner, the plants should continue to be repotted till they reach a small 32 -sized pot, in which they ought to be left to flower. Plants of more than one year old will of course need, after they have been rested, to be potted into pots of larger size than this.

Group of Azalea indica alba at Pen. mice Castle.-The illuatration (fig. 25), show: a group of Azalea inclica alba, grown outside at Penrice Caatle in the ordinary soil of the garden, to which a mall quantity of leaf-mould was added
to open on the 5th inst. is postponed till the 22 ad. Special facilities are offered to gardeners who may feel disposed to visit this the firat apecial exhibition of Lilies held in the country. There will also be a apecial exhibition of Grapen.

Gardeners' Royal Benevolent Inbtitu TION.-The Worthipfal Company of Fruiterers have given a donation of $£ 1010$ s to the funds of the Gardeners' Royal Benevolent Institation.

- H.R.H. Princent Louisz (Dachese of Fife) and the Duke of Fife have graciously aignified their intereat in the work of the Gardenern' Royal Benevolent Institution, by adding their name to ita liat of Vice-Presidents.

Mr. F. Moore, of Glanevin, han been elected a corresponding member of the Societe Nationale d'Horticulture of France.

Shirley and Surrounding District Gardeners' and Amateurs' Mutual improvement A8bociation.-At the monthly meeting beld on the 15 th ult., Mr. R. D. Spencer gave an intereating lectare on "British Herbs, and their usen." There was a fair attendance of the membera, and at the clowe of the lecture a cordial vote of thank was accorded to Mr. Spincer. On the 17th nult., a large number of the members and their friends, numbering ninety-two, had what is hoped may prove to be the first of a serie of annual outing. On

Fig. 25.-Group of azalba indica alba, at pbnbice chetle, awansed.

When the plants were put out. They have now been planted five yearn, and, with the exception of a top-dressing of leaf-mould afforded after they have finished flowering each year, they have had no other attention. No protection whatever was afforded them daring last winter, and whereas in other parte of the garden at Penrice Rhododendroni, Portagal Laurele, Wellingtonias, Taxodiams, and many other treen and shrubs have unfered severely, these are not hart. The aapect of the border is weat. The photograph from which the engraving was taken wat kindly aent by Mr. Minkun, the gardener at Penrice Caatle.

Royal Botanic Society of Manchester. - It will be seen by our advertiaing colamns that the great Lily and Grape show which wan announced

The Royal Gardeners' Orphan fund.The unal monthly meeting of the committee took place on the 26th ult., W. Marahall, Eeq., in the chair. The following apecial receipts were announced: The Wimbledon Horticaltaral Society, ale of flowern at the annual ahow, $£ 558$. proceeds of Rose fair at the Croydon Rone Show, per Mr. G. W. Cumminh, $£ 7$; Mr. W. A. Millire, The Gardens, Underley Hall, box, £1 18s. 8d.; and Mr. C. Hzaniw, The Gardent, Dropmore, box, 17s. 6d. The death of Mr. John Wills, a member of the execative committee, having been reported, the Secretary was instructed to convey to Mra. Wrics the deep aympathy of the committee in her bereavement, and their profond regret on the lom of no noble a apporter of the fund, and of auch a aincere and valued friend.
this occaion the Royal Gardens, Kew, were visited, and a mont exjoyablo day was apent in examining the great collection of plants from all parts of the world; we hope some experience was alco gained. The Prenident, Mr. W. F. G. Spranger, accompanied the party, and by his kindneas and that of a fev friends, the members were provided with lunchoon and tea at the pavilion in the grounds.

Agri-Horticultural Society of Madrab.The last number of the Proceedings contains an account of the annual flower show, held on Februsry 24, which aeems to have been up to the average atandard.
"Traite de Culture potacere." Par J. Drbowsex (Paris: G. Masson).-A second edition of Mr. Drbowsar's excellent treatise on market gar-
dening and kitchen gardening has lately been published. It contain in substance the lectares given by this well-known practitioner at the National School of Agricaltare at Grignon. The plants treated on are arranged in alphabetical sequence, and not only are the details of caltivation explained, but the cont of prodaction is minately examined, and the best method of packing and marketing supplied. Of course, the book is written for French reader mainly, bat the treative is so practical that much of what it contains may be tarned to account here.

A Garden of Pleabure.-The author of Day and Hours in a Garden, has, in this new work, premented to the reader a fresh series of chapters on "The Garden" daring the varying changes of the year. It is a diacursive chronicle of garden progrest, under the varying inflaences of the changing meanons. We shall take an early opportunity of allading to it more at length. Mr. Ellior Srock is the pablisher.
"Vorgeschichtliche Botanik der Cultur UND NUTZPFLANZEN DER ALTEN WELT AUF GRUND Paèibtoribcher Funde." Von Gborg Buschan (Brealau: Max Mücleri). Prehietoric Botany.The origin of cultivated plants is a fascinating ubject of enquiry, greatly facilitated of late yeara by researches into prehistoric collections, whether in the Egyptian tombs, Assjrian monumente, or in poat tertiary geological atrata of various nature. In the present volume the author collects the information derived from these several sources, and presents it in a form which will be very eerviceable to ntudents. He deale with the principal food plante, Earopean trees, and miscellaneous plants of interest. The oldest traces of Vine-culture go back to the time of the bailders of the Pyramide. In the neolithic and bronze perioda, the Vine was also known; whilat a Vine is chown to have exiated in the mid-tertiary period by the remains found in the brown coal formation. This fomil Vine is maid to have had nearer resemblance to the American Vitis cordifolia of Michacx than to $V$. vinifera. It in to be hoped that a tranalation of this uneful work may be pablished.

Letter Cards. - Mears, Langley \& Son, George Street, N.W., have forwarded us some letter carde which enclone a small shest of paper which allows mach increased space for writing. They will be very convenient for tradeamen's ordera, and most uneful for travellers. Long-winded correspondents for the prest are earneatly recommended to avail themselves of thin device.

Kew Guild.-We have received a copy of the Journal of the Kew Gwild for 1895, the pablication of which has been delayed on account of domeatic bereavement. It seems to bs as interesting as its predecentort, but we must defer fuller notice till another issue.

Midoleabrouah Flower Show.-The fifth annual show of the Middlesbrough Floral, Horticultaral, and Indastrial Society, was held at Linthorpe on Wednesday, July 24 , The thow was pretty much on the ame lines as last year, the size of the exhibition, number of entrien, and quality of the apecimens shown being about the same, and there was a good attendance considering the aninviting weather.

Cioer.- We are pleared to find that the National Aasociation of Cider Makers is taking energetic meanures to onaure more attention being given to the cider competition at agricultaral shows. The arrengeroente at present in vogue leave mach to be denired, and consequently do not attract the more important makeri to compete; nor can visitors be expected to evince much enthasiang in the cider ahed, where only a distant view of the cankl and bottlen is rouchsafed. The cider itself is taated only by the judges. In order to utilise the experience of othere, Mr. E. Samson, the Secretary, of 27, Clement' Lane, Lombard Screet, E.C., in going to attend nome of the cider competition on the Contiment, for this is one of thone thinge they manage better in France.

The weather of the Pabt Seabon.Under the title of The Weather of the Past Season (1894), and its Effects on the Garden, a little brochure has been pablished by the Rev. Canon Ellacombe, containing the sabject-matter of a paper read by him before the Bath Natural History and Antiquarian Field Club last December. The writer mentions the great difference in the climates of the yearn 1893 and 1894, and the effect of the variations in temperature of the latter neason upon various plants. The general conclusion arrived at appear to be that great extremes of weather are always more or leas idjurious to vegetation, and that any variety of moderate weather, while favourable to most plants, is sure to prove prejadicial to some few of them, or to the development or retardation of certain of their organ or functions.

Professor Eaton.-We regret to hear of the death on the 29 ch of June, of Mr. Eaton, the recognised authority on American Ferns. Profesor Eaton, who was in his sixty-first year, had been Profesmor of Botany at Yale College for more than thirty yearn. He eame of a botanical family, and a graceful tribute to his memory will be found in a recent number of Garden and Forest.

The Danger of Weed Killers.-We would draw the attention of all who handle weed-killers to the exceedingly poisonous element cometimes included in anch preparations. Mensrs. Spiers \& Pond were recently fined $£ 5$ and $£ 55$ s. costs for selling what wav alleged to be a preparation of arsenic, without entering the signature and address of the purchaner. The preparation was nold as a weed-killer, and is aid to have contained 75 per cent, of arsenic, and 25 per cent. of caustic soda, in all 2 lb .13 oz , or sufficient to kill 6000 persons. Apart from the danger which might result to those baying such mistures without due knowledge of their contents, there is no mall risk involved if ach violent poisons are left lying about in positions easily accessible to children and others igaorant of their natare or contents.

Phylloxera Certificates.-Some communications have reached us referring to our recent note on this nnbject, and requesting us to do our atcoost to get these vexatious restrictions removed, except in the cave of Vines. Oar powere are naturally very limited in auch a case, but we have never henitated in this matter from the first, and shall be pleased to support any scheme for the removal of these fatile and obnoxious regulations. On the occasion when we placed ourselves in communication with the late Lord Granvillis on the abject, we received the asual polite "non possumus;" but times are changed, and if those interented will only combine and make their views known, the circnmstances are now more propitious, as the foreiga Governmente at length are beginning to wee how aseless the rale are.

Mr. Bateman's Garden.-The sale of Mr. Bateman's villa and garden at Worthing is announced for Auguat 14. The garden, as we have had occation to state more then once, is small, but unique in character, highly pictural, and filled with the choicest hardy plants. It in to be hoped that this horticultural gem will fall into the hand of some appreciative pomemsor. That it should become an ordinary suburban vills garden again would be a very unfortunate occurrence.

Agricultural Machinery in Russia. Some two years since we drew attention, in a "Stock-taking" paragraph, to the uncontradicted atatement that the anthorities at St. Peterabarg had done a atroke of "imperial" baniness by importing from the United Staten a number of complete met of agricultaral implement-to encoarage agricultare in certain districts much needing the same. This might have been termed walkiag over the heads of nations, parties to tariff arrangements with the Rassian Government. Surprise was also expressed that the opportanity wan not taken advantage of to atimulate engineering enterprise at home. After a time the opinion gained ground, enpecially among
manufacturers in Lincolnshire, that "thim nond thing" hould be put an end to, and a chance ith by the lowering of import dutien to "outaibo makers and vendors; but this opinion did not otum hold in Germany, some capitalists there huth entered into negociations with the Rasaian Goven ment for the acquisition of lend on which to brild factories for the production of the above-mand implements, and such also as are required in harticulture. As to the success of the application mo know nothing ; bat it is now stated that the exiring tariff will be so modified as to nearly totally exchen foreign-made goods; and this "for the parpon of giving encouragement to native indastry." Verih, the ways of some Governments are wonderful!

Flora of the Sequoia Region.-Mr. Greare Hansen, of the Foothill Experiment Station of th University of California at Jackmon, Amador Conut, California, has prepared for sale sets or single dith mpecimens of illustrations of the Flora of the Segnin region. These plants will be of great service is stadents of the Flora of California, A pampla entitled, Where the big Trees grow, giver nome intereating details in the form of letters to anorb mpondent, and comprise a complete lint of theplath

The Metrical System.- The report of th select committee of the House of Commons remer mends:-(a) That the metrical aystem of wigh and measures be at once legalised for all parpom (b) That after a lapse of two years the metral sy stem be rendered compalsory by Act of Parlismath (c) That the metrical aystem of weights and meamm be taught in all pablic elementary mehoolamis necensary and integral part of arithmetic, and hid decimals be introduced at an earlier period of th achool carriculum than is the case at present.

New York Botanical Garden. - Il 250,000 dola, for an endowment fund having beat all subacribed, New York city is to give 200 selll of land in Bronx Park, and 500,000 doll, for balis ings, improvement, stocking up, \&cc. Efort wi atill being made to increase the endowment furh abscriptions to 500,000 dols. or more.

The Plants near the national Galler! -Tne Pulms and Masas planted ont on the namt atrip of tarf in front of the National Gallery gind very welcome relief to the rather nevere ithed architecture of that bailding, affording a him might be acted apon with advantage in contedind with other pablic buildings, where apace ellomi it being done.

The Gardens of the city of PardThe committee of the Paris Manicipality, to wit is entrusted the ornamentation and maintaman the parks, equaren, and gardens of Paris, the the area of which, reckoning only the lawne, tions, flower-beds, and bordera, is aboat 7o ho ( 1 hectare $=2.471$ acres), posseasen nutaries, mome in the Bou de Boalogne, othern in the mith Vincennes, and the Fleuriste atill at La Parcels. Pasay, and the tranafer of which to the ramply Princel il in progrem. The narmerien apply number of goung trees for avenues sad the ment, about 2000 a year destined for the with and walks, and about 50,000 woody and planta to be used in forming and refarnithing . At the Fleariste de la Ville, with its brapian decorative plants necesaary for furnimio s gardens are raised. The annual production of th cellaneous plante, raised for the decorain ant municipal gardens, amounta to more that of apecimen. Revuc Horticole.

Liverpool Window Garden Aasociarlat In The Liverpool Daily Courier we reaid twenty-first annual exhibition of flowern, mus. ander the auspices of this amociat Hall. Monday, 22ad alt., in St. Georges jubl number of exhibits arpassed that this year's total being 850 . In the competition there were 129 exhibita, and the reported that there was a decided impror
the gardene. Mr. R. R. Meade. King, who uazally anpplied the prizes, intimated that in fature, unless entirely new districts competed, the competition would not be repeated. Therefore entries from fresh parts of the city were invited, and the committee will have pleasare in sending competent judges to determine if gardens to be incladed in the competition are situated in a saitable peighbourhood. In the class for window and window boxes, there were eighty-six entries, and the judges reported that in rome of the diatricts the work wae very good.

Chromicle on May 11, a correapondent, Mr. Frrd. Turner, F.L.S., \&c., Sydney, New South Wales, June 15, 1 495 , obligingly writes as follows: "I notice you akk for informstion about the 'ti-tree bark that is aned for packing frait. One of the 'ti-trees' ('Tea-trees') referred to is Melalenca lencadendron, Linn,, the thick spongy bark of which is easily peeled off in layern, and when cat up fine is as light, if not lighter, than cork duat, and makes good packing material. Several species of the genas Melaleuca, Leptospermum, and even Callistemon, are commonly called 'Tea-trees,' thongh for mome

Fig. 26.-A new datsy: the beide.
M. Ed. Andre. - The lart volume of the Garden is dedicated to M. Ed. Axdrifi, The Editor has availed himeelf of the opportunity of enumerating the many titles to the honour and gratitude of hortioultaristes which M. Ander has won. M. Andsé has, indeed, won a foremont place an a landscapa gardener of the firat-clase, a traveller, \& gardendirector, a botanist, an anthor, and an editor. At the present time M. André, in apite of his work as a landecape-gardener, fonds time to act as editor of the Revue Horticole in aseociation with M. Carbierm.

Thee Bafk ubed in Packina Fruit.-In anewer to an inquiry that appeared in the Gardeners'
nuscountable reason many pernons of late yearn have erroneounily called them 'Ti-trees.'"

Apple Grapts on Pear Stocks.-Mr, Gafynt, writing in the Agriculthral Jowrnal of the Cape Colony, recommends the practics of grafting Apples on the Pear atock, eapecially with a view to circumvent the American blight, which, it eeeme, doen not injariounly affect the Pear.
"Thiouah the Copse:" Another Ramble after Flowera with Uncle Matt. (T. Nucsow \& Soxs, London, Edinburgh, and New York).-This little book is one of a serien written by Dr. M. C. Cooks
on wild flowers an they are found when growing, and is intended for the use of children of about the age of twelve years. The author aime at writing anch books as shall prove interesting as well as amaning to little folk, and he is avowedly carefal in his nee of scientific terms aud long names, leat, by their excensive une, he should dieguat his readera. Those who like reliable information conveyed in an informal manner should appreciate Dr. Coors's style. The hand-book before us is written entirely in the form of dialogne, light enough considering the sabjecte treated of, and interaperned with quotation. Needless to say, the children aak most convenient quentions, which lead up with napposed innocence to inatructive answers, wo gradually bringing out the information which "Uncle Matt" is evidently mont denirous of imparting. The book containe a coloured frontispiece, various illastrations in the text, and is got up in a coooured cover likely to pleate youthfal critics.

Blottina Paper.-We have received from Mearra. K. Cesio \&\& Sons, amples of "an entirely new electric absorbent Spongia blotting paper." It is very good blotting paper, and the heavier qualitiea woald do well for drying delicate flowers, mosese, \&cc.

Frutta Minori.-Dal Prof. A. Pucci (Ulerico Hospli, Mulano). A handbook contaiaing carefal deacriptions and cultaral direction relating, as the title tells, to Strawberries, Meloas, Carrants, Gooneberries, and Raspberries. The figares illuetrative of the habits of the plants and of the fraits peculiar to various species are good sad clear ; bringing out the alient characteristice of each very distinctly. The little work may be recommended to thone who read Italian, and who appreciate a small rolume of convenient nize for the pocket.
"The horticultuaist's Rule Book," by L. H. Bailey (London aad Now York, Macmillan \& Co.)-An excellent manal, which should find a place in every nurneryman's office-indeed, in every garden library. It contain articles on the natare, preparation, and mode of application of insecticider, fungicides, noten on plat diseases, injaries from birds and various animals, weeds, lawne, cements, seed and planting tables, and we know not whas beniden. It is written for Americans chiefly, bat nine-tenth of the book are equally applicable here.
"Histoibe des Plantes." - M. Baillon's remarkable work was nearly completed belore bis death. The last ienued part contains the monographs of the Pandanacere. Cyclanthacere, and Araceg. Ia the latter order M. Baillon follown the indications of Engler, without, however, attachiog the same degree of importance to the histological characters as the German Profesor does.

Bellis perennis The Bride.-A Daisy which is useful to the bouquet-muker and floral artist has been hitherto an unfuliflled want, bat a atrong variety, which will be sent out this sutama by Mears. J. Lambert \& Son of Trier, is asid to answer every refluirement of the florist (Gig. 26). The biossom is sema-globalar, of an enormous nize for a Daisy, furnisbed with a tall atalk, and pare white. In the opinion of gardeners who have seen the plant it ahould prove of value in bedding-out, and, owing to its inability to produce seede, will not become such a troublesome weed as other double-flowered Dainies. The agents for the sale of the plant in this country are Messre. Cannell \& Sons, Swanley.
national Chrybanthemum Society. - A very enjoyable outing was experienced by the membera of the above society on the 22 ad alt., when a party of 140, iaclading a number of ladies, paid a visit to the grounds of Barford Lodge, Dorking, by the kind invitation of Sir Trevor and Lady Lawbexce. Reaching there at noon, the company, after a short interval, sat down to dinner in a large tent erected in the ground of the Barford Bridge Hotel, Mr. B. Wrnve, the chairman of the general committea, preaiding. Au excellent repaat having been
nerved and fall justice done to it, the houser, gardens, and grounds were then visited, the whole of the glasshousss being thrown open to inspection, the condition of the Ochids and some charming floral features in the gardens calling forth well-deservod praise. Many then found their way to the summit of $B \times$ Hill, while others, at the kind invitation of Lady Lawanncs, looked through the mansion, and at five o'clock the whole party assembled for tea on the lawn provided by Sir Trevor and Lady Lawrenct. Tea over, a meeting way held in front of the manaion, at which Sir Trevor Lawrenca presided as one of the vice-presidents of the society, and in the name of the members presented to Mr. Robret Ballantine, the late chairman of the committee, an illaminated addreas and a handsome nilver inkstand, the first having engrossed upon it the realation passed at the annaal general meeting in February latt, recording the thanke of the members for Mr. Ballantine's great eervicee to the society in that capacity, and the inkstand also bore a auitable inacription. M. Balcantine having replied, a hearty vote of thank was pasaed to Sir Trevor and Lady Lawarece, emphaised by three hearty cheers, and the company retarned to town late in the evening, having experienced one of the most pleasant outings yet arranged.

CDER.-Ta hot weather remind us of a beverage which is hiphly acseptable at this season, and that is Nurfolk Cider. Mesart. Gafmer \& Son, of Banham, Astleborough, some monthe aince sent us anmples of various kinds for trial. All were fresb, clear, sparkling kinds, bat the "driest" were to our taste the best. There is no doubt that with increased care in the manufacture, the quality of the cider may be greatly improved and rendered more nuiform. Mesmis. Gafmer evidently are abreat of the times in this respect. Tastiag their cider in comparison with some of a vimilar quality fron Dovonahire, Norfolk took the palm.

Vegetable Agsimilation and Respira-tion.-Mr. F. Frost Blacaman pabliahes in the Philosophical Transactions, 1895, B, p. 503, an account of his experimental researches on thin sab. $j$ jet. The point specially to be determined was the channel through which vapours anter or leave the leaves; that is to say, whether throagh the cuticle of through the stomata. The general renulte are as follow:-

1. Uader normal conditions, practically the nole pathway for carbonic acid gas into or out of the leaf is by the atomata.
2. Ia young leavet the caticle aeems to be more parmeable to carbonic acid gas than in mature leaves.
3. If the atomate be mechanically blocked, an appreciable ommonis of carbonic acid gan may take place through the caticle, provided that the tenaion of the carbonic acid gae be great enough.
4. The normal amount of carbonic acid gas in the atmonphere is not sufficient to produce any appreciable onmonia into leal with ite atomat blocked; animilation, therefore, cannot continue under these conditions.
5. The experimental optimwn of carbonic acid gea for asaimilation depends on the atructural porosity of the leaf, so that, if this be redaced by blocking the atomata, even pare carbonic acid gas may not quite effect optimal assimilation.
6. To this, and not to the stomata being inoperative in gameous exchange (which was Botssingaulr's view), is due the fact that, in concentrated carbonic acid gae, leaf with ite atomata open asvimilates lens than one with the atomata blocked.
7. In bright light a fally green leaf asimilates all the carbonic acid gan that it is forming by respiration, and noee escapes from it. Garezav's demonatration to the contrary in oaly an expremion of the imperfection of the condition under which it was
made.

## The Evolution of a Lake.-Whildt Natare

 manages to creste laken of magoifcent proportion in her own way, artificia! lakew are usaally leas grond,though in relation to aurroundings often as bold and effective, and sometimes even more ornamental. There is to be seen jast now on Mr. Bertaam W. Currie's fine estate of Minley Manor, North Hante, a good example of the procesm of evolution in late formation artificially. The site is of a wild awamplike character, and prior to the commencement of operations, about as unpromiaing a site for the creation of anything artistic as could well be conceived. The idea seems to have been Mr, Currie's own, and the working of it out that of his bailiff, Mr. G. Profit. The water area, almost the whole of which is completed, though began but some sisteen months since, is sbout 50 acres, but it look to be fully doable that expanse. The margin is of a most circuitou outline, the ground having been managed so that where highest capes or promontories have bsen retained, whilat on the lower parts numerons baya or recenses have been formed. This feature in the formation of marked a kind that the entire circuit of bank can ba hardly less than 3 miles. Some inland have also been formed, that will be planted next autamn, as also will the extentive margins. Footpath and a turf carriage-drive will encircle the lake. On one bay a fine boat-house is being erected. The entire arface is now full of water that will in flood-time rise some 2 feet higher. The banks are of peat clods, solidly bailt, and into the tarves Willow slip have bsen thickly inserted. The soil is of bog, and, and clay. In a few jeara a large area of swamp will have been converted into a grand ornamental lake.

New Publications, - We understand that M. P. P. Dégérain han jaut published a book entitled Les"Engrais, Les Ferments de la Terre. The first part of this work is devoted to organic manures and mineral fertilisers, and the second to the fixation and utilisation of nitrogen in the soil. It is apecially stated that the instruction given in this book is of a thoroughly practical natare, and that it in not merely thoroughly up-to.date, but also worded ae to bring its content within the comprehension of all clastes of readera. The publishing-house is Ls Libraire Regef et Cite, 116, Bra'evard S\% Grmaio, Paria.

## Colonial Notes.

## JAMAICA.

Ter Buthetin of the Botanical Deparment, Jamaica, for June, 1895, contains, among other intereatiog matter, papers on "Coffue Peelers for Hand Power," and on "Coffoe Saparators." Is also includes a chemical analyais of the Orange tree, potash and phomphoric acid being the chief contitaents of the frait, an article on "Pimento and its Insect Foes," as well as the result of some lectares and demonstrations given throughout the parish of St. Mary by Mr. W. Cradwick, who hat travelled with the aim of inatructing the inhabitants concerning the unes sud properties of the plants possessed by them, of whone value they were often found to be utterly ignorant. By thus atimulating local entorprise and attracting attention to native resources, much good work in done in quarters hitherto neglected aod unworked.

## KEW NOTES.

Utricutabia rentrormis.-A plant of thi fine Bladderwort, obtained a few years ago from Mesers. F. Sander \& Co. as U. Humboldtii, is now flowering at Kew, and, at I believe, for the first time in cultivation. It is a native of Brazil, Gardaer having found it in 1837 in the Organ Mountains at an altitude of 5000 feet. Probably Messra. Sander \& Co. obtained it along with Cattleya Jabiata. It hav uniform leaven 5 inchen wide on talks 18 ioches high, which apring from slender creeping rhizomes bearing hair-like roots and aumerous ting bladders. The flower-scape is more than 2 fest high, and it
beart four or six pule lavender-coloured flow
at the apex 1 inch long and wide, the appom. like lip notched and cbannelled in the middo with an inflated chin-like creat bearing tho atresky of white, margined with purple, and the short hood-like apper aegment is blotched with the ame colour. The plant is likely to be more prias by botaniat than by gardeners, for it is not no good a garden plant as U. montans. The Roraima apecie, U. Hamboldtii, differs from the above in haviag epathalate leaves 4 inches wide on atalke 9 inche long, and a cape 12 to 18 inches high, bearicy about twenty flowers, which open three or fore together, and are of a rich purple-blue colour, fully twice the aize of those of U. reniformis. Mr. Im Than, who collected U. Humboldtii on Roraima, naya this it grow among rank grass in wet awampy part, the flowers mingling with the grass, and its roots in the ground. Here it is far more beantifal than when in the water contained in the sheathing leaf-base of Brocchinia cordylinoides, to which it is atrictly confined in some parts of Britith Gaiana. We have had it imported in plants of the Brocchinis, but it aere did any good, although the hout plant lived, and is now represented by fiae exsmples in the collection of Bromelias at Kew.

## Amasonia erecta.

This plant differn from A. calycina, introducel and distributed a few yeara ago under the nama of A. panicea, in having larger broader leares and aborter wider bract coloured bright scarlet, nhite the flower are nearly white with atreaky of purple An example of it is now in flower at Kem, sad \& figure of it will thortly be pablished in the Botamioul Magazine. Mr. Sinder, who imported this apecies from Brazil, aays that it was described by bil collector as being mach more ornamental than A. calyciaa, but so far it falls short of that specim in being more diffisalt to caltivate. It in dencribed as forming a shrub 2 feet high, and as being commol in woode near Rio. A specimen collected in Britiol Gaiana on mountaios near Kaieteur is labelial a growing to 4 or 5 feet in height. Ponibly win wrong in keeping $A$. erecta in a hot atove.

## Cenvum Roozemianum.

This is a valuable addition to atove Crinuma, If bas already been fally described and figured in the Gardeners' Chronicle, and I refer to it here chiedsfor the parpose of identifying it with the plastiatov daced from Jamaica by Mr. Worsley, and dencribed by him in hir Notes on Amaryllidece (1893), p. under the nam, of "C.Jumsaense? = erubenm var.' The typica! C. Roozonianumand Mr. Worley! plant havo lately flowered side by side at Kow, will they are exactly alike. Ose of the K aw plata beit an ambel of twelve white flowers, each fire indivy acrose, and deliciously fragrant. I can atrouply recommend this Crinam as an eavily-msanged, fow flowering atove plant, first-rate in every poiat,

## Hipplastrom braceyawdruy.

When Mr. Baker described this distinct and bat some species is Gardeneri' Chronicle, 1890 (2), pp 15 . we knew it oaly as having fowers' liko Amuli Bolladonna var, blands in the upper half and colorin. deep blackiah-red in the lower half of the etgen Plante of it flowered in the open air at Kor, wisw proved to be nearly hardy, and a figure of it publiabed in the Botanical Magazing lant yo 7344. Sired linge raised at Kew from seeds by the platat Ggured have juat flowered; bat in twow the flowert are of a pale pink colour in half, pale green in the lower half of the segrutur thedeep blackiah-red colour having quitedimppe fins Here is a atriking colour variation in the f of seedling raised from a good apecies introlsw from Parana in South America by Mr. Bartholod of Reading in 1890.

Etganta malacceneis.
There is fine specimen, 12 feet high, of handsome tropical ehrab in the Palmohonse al which has borne anoually for the lant excopsic crop of fraits. This jear it bas boen as woply phe prolific, the loxat branche being literally
with glosery purple-rose egg-shaped fraits, about 2 inches long. They are feshy, and not unpalatable; I have tasted worse Applen, but they were very bad ones. The flowert are even more ornamental than the fruit, the large brash-like clasters of stamens, of a rich crimson coloar, being the chief attraction. W. W.

## POTATO-DIGGING IN IRELAND.

Whisst near Tipperary in 1892, Mr. W. G. Smith made the accompanying sketch of Potato-digging. It reprenents the very worst position for growing Potaton, viz, a awampy bog. The plant in flower in the background is. Lythrum Salicaria. On the left are roll of peat from the position where the attempt was made to grow Potatos. The stump in the foreground is that of a bog Oak in situ. The Potatolifting was going on in rain and wind. The cottager and his daaghter were clothed in rags, and both were helpless and hopeless. In travelling
made a practice of cutting everything they have in bloom-good, bad, snd indifferent. It was pitiable to see poor little bunchen of half-developed Anemonen and Ranuculus forming a foreground to an exhibit, and these were only too representative of others. The crowded arrangement imparted an ordinary and monotonous appearance to the collections, and they lont much of their attractiveness and interest in consequence. The Council have such an ample choice of material with which to make this show that they should be eclectic ; a certain number of bunchen only being aaked for, and these should consist of the beat flowers in good condition at the time. The largent allowable number of banches might be fifty, and thene should be of good size, so as to adequately represent the plant; and there shonld be no duplicater. A limit being thus put to the number of bunches shown, the exhibitor should be required to effectively diaplay them in auch a manner that the individaality of each might be brought out. Farther, where aeveral varieties of one species are shown, or different species of one genus, they should be placed in juxtaposition for the parposes of comparison. This would make the Temple Show more
to be. It is a profuse cropper, some of the truase producing from seven to nine full-sized Tomatos. It is very firm and solid, with flesh of good flavour and unuaal depth, and very little seed space. Mr. Ryder inform me that he gets the beat price for it in the market. This year he has planted twenty houser of this one variety, and here it can be seen in all stages of growth, both from seed and catting: ; in fact, Mr. Ryder telle me that he gets heavier crops from cuttinge than from planta raised from seed. Amongat other Tomato that are cropping freely with no nigns of disease are Frogmore Solected, which is another good variety, of short-jointed, aturdy habit, and good-sized truesea of fruit, and which is likely to become a reliable market art. Polgate is another variety doing well ; but I fail to see any difference between this sort and Perfection, and Mr. Ryder tell me it is quite a fortnight later with him than Dake of York. Chemin, a French variety, is good, and fraiting freely; almo Golden Sunrise, a yellow variety, carrying good trusees of large handmome fruit. All the above are growing side by side in one long houne, to teat their cropping qualities. Mr. Ryder never stops bis Tomatos, but grows them on the single tem right over the houste. F. London, The Gardens, Becchwood, Farnborough, Kent.

Gardeners'Characters,-Iamglad"H. M.C.' is calling attention (through your issue for Jaly 13) to one of the mont serions circumstancen, namely, the refusal of employers to give characters. I have been gardening for seventeen years, and I find, generally speaking, the most promising youths and the most able men are those most anfortanate in this reapect; concequently, they are prevented from following the occupation they were enpecially fitted for. I wish some of the candidates for parliamentary honoura would make it a test queation, so that it may be dealt with effectively in the Honee of Commons. One Interested.

THE HARDY-FRUIT PROBPECT8.-I think we ahall be favoured with a very fine fruit season. The scarcent being Apples in orchards. Thewe, upon nome trees, are very thin, notably Blenheim: and Ribston Pippina, Wellingtons, amongat the mont useful varieties we have. Trees of Lord Derby, Warner's King, and aome amaller varieties are loaded with fruit. Pear-treen have an excellent crop on the walls; have had to thin heavily, especially Pitmaston Ducheas, Catillac, Marie Louise, Louise Bonne, Knight's Monarch, Doyenné du Comice, and Ne plan Meuris. Cherries are good. Peachen and Nectarines are an extraordinary crop. Oat of curiosity, I counted 500 fruits thinned from a four-year-old tree of Sea Eagle. Apricots very good and large, the Shipley being the bent. Plums are a wonderful crop, both Greengages, culinary, and demert varietien, and we have had to thin them. Gooneberrien, Raspberrien, black, red, and white Currants are a good crop. Strawberrien have been, and are very good-in fact, the bent that I have had here for the late seven years. Cobnute and Filberts are bearing heavily, and Walnuts very abundantly. The Quinces and Medlars have only a fair crop of fraits. A good rain would be very beneficial, as the rainfall for the last two monthe has been considerably below the average. We only had rain on aix days in May and early June, and it practically did good only on three daya, and the whole was under three- quartern of an inch. W. A. Cook, Compton Basset, in June.

PLANT DECORATION.-Few men did more in their time to promote highar and more artistic taste in relation to plant decoration than did the late John Wills. It is perhapa poor praise to way of some of thone beantifal efforta neen in days past at South Konaington, that they were revelations. Practically, Mr. Wille revolutionised our atyle of plant decoration; very likely, had he not done so, some one elne would, but at least he was the pioneer, and immediately he found myriad of dinciplen. Still, he did not convert every one from their heary atereotyped methods. Twenty years of pernistent illustrations of the higher art in plant decoration by Mr. Will or other able imitatora have not sufficed to eliminate much of the old Adam of decorative effort from gardening, just because there are so many would-be gardeners or decoratora who have no more care for taste, elegance, or harmony in plant decoration than has the mereat tyro. Try all they may, they produce a jumble, or a mere atiff, formal bank of plants or flowert, and no more. Will went to Nature for his conception of a plant group. If we conceive of tropical life, with ite overhanging Palms and Fernm, and beneath its
arpet of flowerk and leafage，or even of our own woodland or forest scenery，with it panoply of leafage，and carpet of bracken or other undergrowth， we get a fairly good idea of the origin of his deaign．He，however，had at his disponal choice material，yet he never sought to make too mach of his colouring，or fell into the common error of making everything subsidiary to ⿴囗⿱一一 Soral effect．His larger groups were made wo an to retemble glades and vistas，and they were always as cool and refresh－ ing as they were besutiful，yet they were never ng Disciples have since his day given to ns gandy．Disciples have since his day given to us aly flower hows many charming groups，though only the few have atood out as real decorative artists． Too much of the beanty and taste we do see is rather imitative than natural，bat we may be thankful for mo much．Some day，perhaps，in these thing the higher tatea may univerally prevail． A．D．
lUCULIA CRATIBEIMA．－Thim handeome shrub， when grown well，may be deacribed as one of our best greenhouse plante．It thriven best when planted out in a bed in a mixture of fibrous loam， peat，and and，and requires abandance of water duriog the summer monthe when it is making itm growth．Opiniona vary considerably regarding the pruning of Laculias，but natarally enough，if they are praned well back after flowering，and the plants kept dry until growth commences，sarely this mas be the right way．We have two fine specimena here which were treated in thil manner last winter，and which now present an appearance which justifies the anid treatment．The propagation of Luculia is by no mesna an easy task，but the best method I know is to insert cuttings of young shoote into small pots about midoummer，place in gentle heat，and keep enclosed under a bell－glass．Seedling planta grow very rapidly，but seldom flower so well as those pro－ duced from cuttinge．Geo．Burrows，Warwick College

LARGE CEDAR8 OF LEBANON，－Apropo of the enquiry which appeared in thene pages a few weeks ago，I may aay that some of the finent Cedar trees in thim country are to be found at Goodwood Chichester．In an old book I have before me I find that in the month of April，1760，the third Dake of Richmond planted 1000 Cedars in various parte of his domain，the plantn being then four years old． Of courne，in the period that hae elapaed many have nuccumbed to galen and other mishaps，but many noble epeciment remain，and appear to be in great vigour，forming one of the glories of Goodwood． One apecimen in particular is a very grand one，and it is figured in Mesarg．J．Veitch＇s work on the Coniferm，though evidently the measurements given there are incorrect；an I find，by pansing the tape round it to－day，the girth，at 3 feet from the ground， in 25 feet 8 inches．The tree hal a diameter of crown，measuring from tip to tip，of 128 feet，and is more than 90 feet in height；it has a clear stem of 6 feet，from which spring a number of enormous branches，sud the form of the tree is quite sym－ metrical．Three other large tree growing in close proximity to this one have clear atems of from 6 to 8 feet，and girthe，at 3 feet from the ground，of 22 feet 2 inchen， 22 feet 9 inches，and 21 feet 8 inches reupectively．These brees have been messured from time to time，sind a record kept；and the earlieat I can find is 1857，when the second largent girthad 19 feet 7 inches ；1863， 20 feet 4 incher； 1892, 22 feet 7 7 inchen，Rich．Parker，Gardems，Goodwood， July 8.
geEDLINa FUCH81A8．－The abundant rain is putting new life into regetation，and the Fuchaias are making up for their hitherto tardy growth．I am sending a few bloom gathered chiefly from the open garden，of crosses of the Fachsia，which you will observe differ much from the ordinary varietiea in colour and shape of bloom；the growth is vigoron： and flowers are abondantly produced．No． 1 has coppery or dark foliage with veins in the leaf；No． 2 it a seedling of thin year，and chould prove a very telling variety，the colour being quite novel．Aagust is the beat month in which to see Fachsia in bloom． P．F．［These blossome were peculiar in tha colour of the sepals and corollas，but that they are improvements in the beat sente we can scarcely admit．ED ${ }_{2}$ ］
fell in heav rainfall in Yobicahine－Heavy rain fell in thit district from 9 a M．on Tharaday，Jaly 25 ， depth of rain hour the following moraing，and the depth of rain regintered whe 270 incheis，which in the mont that has fallen here in twenty－four hours in my recollection．The heavient fall oceurred in
the afternoon and evening，and wat accompanied with thunder．Whether it was merely local I have not getascertained；but it is probable that such a downpour extended for a few miles around．The downpour extended for a ground is thoroughly maturated，and vegetation in gardens and fields will be greatly benefited，espe－ cially the fruit trees．If we get fine warm weather， this will be the finest fruit year we have had for many yearm．J．Easter，Nostell Priory Gurdens．

NATIONAL CARNATION AND PICOTEE 8OCIETY （Southern Section）．－I notice in the report of this society，the question is asked，for what purpose ara Carnations shown with a mingle apray of foliage： The words are these：＂Blooms of any single Carna－ tion with a aingle sprsy of foliage were also shown， One can acarcely help asking，for what purpose，as they suggested nothing new in design or une．＂What does the Gardeners＇Chronicbe reporter want？The public has more than once been informed in these pages，that showing Carnations on card is very bad taste indeed．It was，therefore，suggested that the bloom be shown as cat from the plant，with a spray of foliage ；there was no other purpose．The Carna－ tion is almost universasly used as a coat－flower，and showing different varietie with foliage might saggest to those interested the best varieties for this purpose， and to those intereated in the cultivation of Carna－ tions，it would how the flowers just as they are． Varieties that aplit the calyx are no use to exhibit with a spray of foliage．Jas，Douglas．

RUBUB PHEENICOLASIUS（WINEBERRY）．－ Within titty Farde of West Malling gas－works，in a private garden，the produce of which is sold in the town adjoining，we find a row of the Wineberry of the Japanese growing in the finent laxuriance， 5 to 6 feet in height，and clothed to the ground with its clasters of fraits like the specimen enclosed．The gardener informed me that three yeara ago he par－ chased a packet of Wineberry seeds for a few centa from the Contiaent．These were nown ；and after waiting nine months，the plants here came ap．Is it that the dry umomer has been favourable to the growth of this plant？Seen as it is here growing，one cannot but think why it is not grown in the herbsceous border and in our shrubbery borders，for its sof copper－colour tints of the stema，and the whiteness of the under－side of its Raspberry－like leaves，forms an object that the eye catches at once．My informant tell me it fruits abundantly，and that the Mulberry－like fruits are relinhed at the end of Auguat，when they are either sold or made presents of by the proprietor． Propagation appearn to be from meed or layern there do not appear to be many anckera from the bottom．P．F．A．

THE PHYLLOXERA LAW8－It is to be hoped now that the Belgians［French］and Italisns are meet－ ing for the express purpose of expanging or maode－ rating the obligations and reatrictions hitherto imposed upon them by the Berne Convention many years ago，that England will now endeavour to free herself from the burdentome regulations，and not fail but hasten to throw her influence into the matter of mecuring the free exportation of plant into all countrien，Nareerymen and caltivatora of plants generally have been severely punished during the lant fifteen years by these aselens regulations， and probably for absenting ournelve from the above convention inatead of attending it and showing the abourdity of including this country among thowe likely to apread the Phylloxers．Even the curators of our botanical gardens have aince had their plants ruthlennly returned by Vine－growing countries，no matter how necessary or important for the well being of mankind they may have been，and that too occamionally when the certificate had been duly aigned by a commissioner for oath．I hope the council of the Royal Horticultaral Society and our botanical wocieties，as well at the horticultural trade generally will lose po time in electing an infuential delegat to reprenent England at the meeting to be held on the 4th of this month，and in doing all that lies in their power to confine the reatrictiont，if any are impoed，to Vines only，so that our plante and balb may po free from all hindrancer，and trom usele： expense and obligation．H．Camell，Suonley．

Cinerarias．－Mr．J．Miller，late of the Dardham Down Narseries，Bristol，sent me ap to Isleworth in 1833 ，to Mr．J．Willmot to learn market parden ing，but anked me if I saw anything new or good to let him know，which I promised to do；and a I had a little leinare，I made a todr of all the nur－ werien of any note；Mr．A．Hendermon wat then fumous for Cape Heath，I remember．Of these

Mr．Miller had about 110 pecien and varietien no that was a place of interest to me；st Menm Lee＇s of Hammersmith I saw some； 200 or mom， Fuchaia fulgens just ready to be sent out at $2 \mathrm{l}_{\mathrm{s}}$ ead and so all round．Mr．Loddiges was then at Hacton Mr．H．Low at Clapton．Bat it was at Mr．Kaigh of Chelsea that I saw a whole house fall of Gin rarias in fall bloom，and one blaze of brigh colour，mostly rose of various hades，some almon scarlet．I atill remember it as a sight I had nom wituessed before．Oi courne，the person whom showing me round arw my amazement．Bat Im not certain if he told me that they were crones be tween cruenta and populifolia，or if it wat only conjecture．I have，however，the impremion the were crosses，but this particular lot mast have bow several generations old even then；at least this m my impresuion，or I was told so，perhapr．Cruente as I knew it at the Durdham Down Narserien，wad a much dwarfer habit than the one figured nome lith time since in the Gardeners＇Chronicle，and had asger flower，but populifolia，as I remember it，wat ang of half ahrubby species，with shorter，wider petal of a violet－purple has．The above stated viit ma in the spring of 1838，when Kew was quite a con trast to what it is now，and when the Horticultona Gardens at Cbiswick were much larger than nom I have always thought that Mr．Knight was the find to work apon the Cineraria，and had no ideato the contrary．George Lee，FR．B．S．，Clevedon．

## WHEAT－EAR PELARGONIUMS．

Mr，C．G．Terery obligingly sende an ape cimen of a zonal Pelargoniam（ $\mathrm{G}, \mathrm{a} .28, \mathrm{p}, 135$ ），il which each flower of the truas is represeated by a sike of densely packed linear green brach， no trace of the flower being apparent，Wh have occasionatly met in Pelargoniums with thil malformation，which is identical with that in Smet Williams and Carnations．Oar forefather aned to spak of＂Wheat－ear Caraations，＂and we my extend the epithet to Pelargoninms．

## DEYON AND EXETER GAR DENERS＇ASSOCIATION．

Tere fourth annual outing of the Awociaton tow place on Wedneaday，July 24，when aboat member started from Exeter in braket， visited Poltimore Park，Bradfield，and Kuigh haye．At Poltimore，Mr．J．Martin，the ar dener，met the visitors，and conducted them ord the gardens and grounds．Oatdoor fruit has why been a feature at Poltimore，and the prestige in mad maintained．Apples were particularly fine，sour dant，large in size，and even now showing fine color The Grape Vines are well cared for，and are croping heavily．The kitchen garden of 8 acres was in cellent trim．In the grounde the Lime tree sean of 1000 feet in length，which forms a delightis canopy of foliage，was worth going a long ditay to see．

The avenue of Cedrus Deodara is s fine ous trees averaging 65 feet in height，and about 10 uti girth．Several of the treen were bearing cont in having 100 to 200 on it．The Wellingtonias sith timore are well known．They were amoagt the planted in thix coantry．One of them is 85 淪 high，with a girth of 16 feet；and anothar is ontith with a girth of 20 feet 6 inches．Abies 58 feet，with a girth of 9 feet；Pina find 72 feet，girth 12 feet 6 inches；and taberculata， 56 feet．This specimen peculiarity of the variety in having is andy dotted all over the trank and maia tree， 1 ， A few cones were found undernestion the the bit was pointed out these had not dropped of come down with fallen branchen－．Liriodendron tol doen not drop its cones．Liriodendran Magnolia Soulangeana，Taxodinm Before Hemiock Spruces are good here．Bore Mr．Martin，by desire of Lord Poltimore， his visitors to lunch．

Continaing the drive through the tom iampton，in which，in Col．Fontern gardern fashioned one－there was pointed fath throush clump of Ommada regaliw，quite 10 fetbtirold
over 5 feet in height, flowering profasely. It was close to an old well, hence ite vigour. The next halt was at Bradfield, where Sir William Walrond' agent (Mr. C. E. Hay) was waiting to give a bearty welcome to the voyagers. Under the guidance of Mr. T. Heath, the gardener, a tour of inspection was made. Grapes were found to be first-rate. Gro Colman, Black Alicante, Lady Downea' Seedling, Fouter's Seedling, and Barbarossa, all very fine. Outside, Marie Louise and Winter Nelis Pear were howing heavy crops, and one or two Apple srees were well hung with Mistleto. In the grounde wers remarked Retinospora squarrona, 20 feet; Salisburia adiantifolia, 30 feet; Sciadopity:
another nine-mile drive was made to Knightebayen. Mr. J. Dickson, who came from Keir House, Bridge-ofAllan, only aix monthe ago, was in waiting for his confreres, and piloted them roand. Everything in the fruit line that was in bearing was the very pink of perfection, Peachen and Nectarines on screens being masterpieces of cultivation. Grapen were equally good, Mascat Grapes splendid; indeed, the "glass " was about an well done an it could be. In the open, thinge were equally creditable. The cropa and the tidy appearance of the place, taken as a whole, were such as to show that the race of Scotch gardenern in not a thing of the past.

A drive to Tiverton to tea, and a 15 milen drive

Fig. 28.-wheat.mas perarconiome. (sum p. 134.)
verticillata, 8 feet (a grand piece); Abies grandia, 65 to 70 feet (planted in 1871); and Chamærop: excelsa, 12 feet, were noted. Near a comparatively recently-formed Arboretum were nome abtropical subject doing well. Fankias, Osmundas, Spiras Lindleyans (a grand abrub), and other anch plants were mont effective.
In the flower garden the Golden Yews were uncommonly fine. Some eventeenth-century English Yews planted on the aite of an old chapel, dating back to May 17, 1332, were pictures of health and contentment, and were trimmed in the old-fashioned fantastic atyle. There is at Bradield a fine avenue of Cedrue Deodara, and snother of Oak.

Sir William Walrond, with his usual hospitality, had arranged for an excellent lanch for the party, and they having had a long drive and a long ramble, this wan much uppreciated.

Having again got the travelling inspectors aboard,
home, ended one of the most pleasant and instructive outinge the Asaciation ham yet held. The arrangements, carried out by Mr. A. Hope (Hon. Sec.), Mr. W. Mackay (Hon. Treas.), and a committee, gave general estiafaction.

## SOCIETIES.

## ROTAL HORTIOULTURAI. <br> Scientific Committee.

Jotr 29.-Dr. Matterv, in the chair.
Cypripedium Malformed,-Dr. M. Masters deerribed a curious case received from Messrs. Sander \& Co , in which the sepals were normal, but the two petals and lip were abtant, The columa was erect, terminating in, imree tabilar atiguas, and beariog three petaloid, two-Lobed, imbriesting staminodes on the edge of one of which whe an anther. They appeared to
of the inner whorl was perfect, with a curved flament bearing two-celled anther. The other two were absent.
Lavandula dentata Foliage. - Dr. Mastere aleo drew attention to a peculiarity in the venation of the lobed leares of this species, in that the "median" cord of each lobe was not central, but close to one side. Froms this a cord ran round the sinus, giving the appearance of the corde running from the midrib to the base of the incisions, instead of to the epioee of midrib to the base of the incisions, instoad of to the apioes of Hawtborn, but this has median corde as well as cords running Hewthorn, but this has median corde as well as cords running
to the base of the incisions; or, again, that of the corde in the to the base of the incisions: or, again, that of the cords in the
petale of the Composite, which run up between the petale and petals of the Compositee, which run up between the petale and
roand the margins of the divisions A very aimilar coourrence is in the receptacular tube and calyz-limbe of the Cherry. though here, too, esch sepal-lobe has it proper median cord as well. Marginal cords are general in the calym of Salvia and other Labiaten, and appear to be supplied for strengthening purposes,
Aicidium Nympheoider, D.C.-Dr. C. B. Plowright forwarded specimens of thin parasitical fungus, with the following observations:-" This 平位diuma has beon stated by Cbodat to be connected with the Pucciaia on Scirpun lacuatrie. In November, 1877, Puccinia Bcirpí was found floating in the river Ouse at King's Lynn. During the past winter II found it on the Bulrushes (S. lacustris) in the 'Old Bedford 'at Earith. Huntingdonshise. On revieiting the spot this July, the Ecidium on Villarsia was met with in great abundance. The recidial cupsoccupy the upper surface of the leaves in the form of sufficiently obvious circular yellow spots. After the affected leaved have been removed from the water for a short time the mouthe of the cups close by a procens of inversion, as if they were immature; but when the leaves becone thoroughly dry the cups again open. The scirpus in the immediate vicinity of the Accidium was affectod with the uredospores."
Ecidium Chenopodii.-Dr. Plowright also sent specimena of this fangus, with the following remarks:-"In the samanes of 1893 Mr. Herbert $G$. Ward found on the mud flate of Terrington'St. Clements, an Ecidium on Sueda maritima. Shortly afterwards I met with the same fungus on the muddy shore on the opposite side of theentuary of the Great Ouse, near Babingly sluice. It was accompanied by uredoapores and a Uromyces (U. Chenopodii, Duby) on the same plant. By some botaniste this fungus is regarded as identisal with U. Balicornies, D.C. on S. herbaces. Doubtlees the host plants are allied, but it does not, therefore, follow that the parasitic fungus is the same. Salicornia herbecea grows abuodantly in the abovenamed localities, but hitherto I have been unable to find the Uromyces upon it, although it is a British species."
Flies attacked by a Fungus.- With reference to the specimens brought before the last meeting, it is reported from an examination made at Kow that "the fungus is Empuss conglomerata, Thaxter (a somewhat rare apecies), parsaitic on Diptora, empocially the larve and itragines of Tipuize. Dis-trib.-Europe aed United States. This is the first record for Britain."
Grapes Diseased. - With reference to the samples sent to the last meeting, the following report has been reosived from Kew:-"The Vines are attacked by a fungus called Glueosporium ampelophagum, Sacc, a well-known pest in wineyards. The mycelium of the fungus is perennial in the branches, and passes into the new shoote as they are developod. The first fruits formed by the fungus in the spring are found on the old wood, and the apores carried by the wind or rain or syringing wood, and the spores cang frutt, the mycelinm aleo travels reach the lowers and youg haik, ine mycerium aleo travel
 mixture of equal parts of thar and powdered chalr should be applied to every part of the Vine, dating from the commencement of branch formation until the fruit is aet. All
shoots that are more or less covered with minnte black specks shoots that are more or less covered with minate black specks
should be cut away and burat at once, as these ase the fructishould be cut away and
fication of the fungue."
Thornless Gooseberry.-MM. Letelletier ot File forwarded from Caen some growing plante of this variety, from which they have iovent some linds raised by M. Ed. Lefort, of Meaux, France. The asual triple spines were either quite absent, or represented by mere rudiments only.
Potatos grown in "Jadoo" Fibre. -Jadoo fibre appears to be peat-moss saturated with chemicals. The Potatos were very clear, clean, and apparently thin-akinned, but amall. The Committee could pass no opinion upon their value, as no information was received as to the composition of the material in which they were grown.
Suceet Williams, Sudden Reversion of.-Mr. Cannell sent some trusses, with amall jagged-edged petale of a crimason colour, which had appeared among his long-selected bede of Sweet Williams, the margins of the petals being rounded and smooth. The form which, on its appearance, is never allowed to set soed, approzimated to the original wild condition, an dencribed by Gerarde, this being apparently the onily knowe form in his day (1597); but Lawrence (1728) describes many kinds, and observes that similer whole or eelf-coloured forms occasionally appeared. The following are quotations trom the two authore:-Gerarde (Herbal. p. 479, A.D. 1597) figures and deecribes the "Sweete William" as of a "deepe figures and describes the "Sweete William the of a doepe kind. Lawrence in "A New System of Agriculture" (p. 42d, A.D. 1726) says:-" There are two or three sorte of this pretty Hower; and, indeed, the sorts are almont infinite if you nicely observe the divarsity of stripes and coloure, and the aportings of nature even in flowers on the same stalls, there being hardiy to be found two exactly of the same sorte, exoept ther prove (se they do sometimes) solf-coloured. The single ones differ only in the colour of their flowers, some ane red and white prettily intermixt; others are mixt with a deep crimeon. and from their seeds great varieties bave been raied. There is also a double flowering kusd of a beatiful red."

Fruit and Vegetable Committee．
Juir 26．－A special meeting was held at Chiwwick Gardens on the sbove date，Mr．Balderson in the chair；also present Memorn．Glen，Wythea，Batea， G．H．Sage，Farr，Rons，Pope，A．Dean，and A．F Barron．Lettuces as growing firtt had attention． These in numerona varietien，both Cos and Cabbage were dealt with as they were found，irreapective of newness or otherwise．
Three marks were unanimonsly awarded to Romaine Grise Monachere，a very handsone and perfect stock of Paris Green Cos，also to Romaine Ballon，or Superb White Cow，both from Mesars．Bemary，also of Cabbage Leettuces to a smooth－leaved Mesors．bewne，also of（Benary）a first－rate stock，some White variety，Satisfaction（Benary），a frst－rate stock，and hing after Leyden White Dutoh，of good modium eize and ompact；to Grosse Brune tetue，a large copper－coloured form，a capital atock；to Merveille des Quatre Saisons，also a large copper－colouved variety，from Menst．VlimORar．A handsome \＆\＆onge palegreen，curled variety，Royal Malta，fron Eandisor 2 Sons，and Iceloal，somewh
from Mesars．Virtori as Song．
Dwarf Franch Beaws．－OI theee，out of a large number growing for trial，particularly good，indeed highly meri－ torious，in Longfellow，sent by Hevdersos of New York． This is a fairly strong grower，an immense cropper，the Beans long，narrow，and of the best fiavoar．This will doubtless become a standard variety．Seed is of a medium aize，and reddish speckled．Also to King of the Greens（Vilmorin），a dwarl，compact and very green－leaved and podded varioty，a good cropper and of excellent quality，seed smallish，flat，and pale－green in colour，To Dwarf Rarly Mangetout（Vilmorin）， a very early variety．pods fairly long，and densely pro－ duced．This variaty is evidently one of the carliest in culti－ vation：roundish white seed．Also to Butter Bean Beurré Doré naine（Vilmorin），a wonderful cropping variety，apparently one of the very best of the section．The Beans whan cooked were delioious，as also were those of Longfellow．
Owing to the previous drought the Pous were so far a failure this season that they were not fit to examine．A splendid trial of Braseica is in progresa，the plante having done wonderfully well．These will be at their best a f：$w$ weeks later，as also will a considerable breadth of Potaton．
Fruits．－The attention of the Commitcee was next direoted to an early Plum carryilg a good erop of fruit on a western wall，that had given fally rice fruits so early as the 19th of July．This was Rivers＇Rarly Favourite；the fruits small，parple in colour，flesh very anft and pleagant，and at a delicioas flavour，freestone．The Committee unani－ monsly agreed to recommend a First－clase Cortificate to this moet valuable addition to our early dessert Plums．The atton－ tion of the Committee was also drawn to a number of standard Gooseberries worked on clean stems，some 3iffeet in height＇；the stock is that of Ribes anreum，grown cloee by specially for the purpose．Currents also work freely on this admirable atock， which is a strong grower，and soon produces tall clean stems． A number of Morello Cherries on a north wall worked on stocke of Cerasus Mahaleb，were also noticed；these produce very strong growths indeed as compared with the poor growth of Morellos on the common Cherry wtock．

## EUREEY FLORICULTURAL．

Jour 24，25．－The fifty－firat annual exhibition took place on the above dates，in the grounds of Brockwell Hall，Herne Hill，by kind perminnion of J．J．Blackburn，Esq．

For a group of plants arranged for effect，iet honours were secured by Mr．J．Lambert，gr．to H．W．SxaELCKE，Esq．， Elfiadale Lodge．The Crotons in this collection were well coloured，and good use was made of Francos ramosa，An－ thariums，Oncidiums，Gloxinias，\＆c．A ereditable arrange－ ment from Mr．W．Farloy，gr．to J．C．Lovell，Req．，Tulse Hill，was placed Ind．
For six foliage plants，Mr．Howe，gr．to H．Tate，Req． Streatham，gained 13t prise with magnificant examples of Alocania Tribautianum，A．macrorhiza，Dracsen Lord Wolse ley，D．Goldiann，te．Mr．Howe occupied the tame poxition in the cines for aix Ferns．
For six Draceenas，diatinct，the lat ponition was gained by Mr．LaMBERT；and Caladiams were very well shown by Mr W．FAlkLey，who took let honours．
Foliage Begonias formed a pretty feature，lst honours for a fresh，distinct，and even lot of plants being gained by Mr．J． Swaine，gr．to E．Joxie，Beq．，J．P．，Clapham；whilst a very creditable exhibit gained 2nd place to Mr．A．EniEN，gr．to W．E．Joherson，Esq．，Tulse Hill
Palms were well shown，the leading prize－takers baing Mewors．Lambert，Dhy，and Longlix．A magnificent ex－ ample of Kentia Fosteriana secured Mr．LAMBERT the leading porition in the clase for a specimen foliage plant．In the clase for sif Fucheias，some finely－flowered plants were shown by
 the same exhibitore wouring $18 t$ and 2nd prizes respectively for froely bloomed Begonias．Potumise were good，Mews．FirLex and Rofe mowing well．
Well－colowred Coleused were ntaged by Mewors，Boze and
For
For four miscellansoun plants Mr．W．A．Chalk，gr．to of Asparagus plumous，Adiantum tragrantisuimum，piece Groton Baron F．de Rothschild．

For a bor of cut flowers，gracuful arrangement gaised

Mesars．Sutror \＆Sons offered special prizes for a collection of Vegetables．The winneer of the lst prize was Mr．W Farlex，with fine examples of Magnum Bonum Caulifiower Tender and True Bean，Perfection Tomato，Eareka Pea，\＆c．
Mr．Silver also offered special prizes for a collection of Vegetables；here the succesaful competitor wan Mr．RoFE noteworthy being Perfection Tomsto，the Mummy Pea，Early French Horn Carrot，Potato Coloseal，\＆c．For three bunche of Black Grapes the 1nt prize was a warded to Mr，W．Howe fo very fine Madreeffeld Court，and he also secured the prizee for White Grapes with Muscat of Alexandria．
Non－competitive exhibrts．－Messr3．Join Lativg \＆Sons， Forest Hill，sent a group of foliage and flowering plants， Foegonias being apecially good；Mearrs．J．Peed \＆Sons， Begonias being specially hood；Megoars．\＆c．；Mr．B．Neal
Norwood，sent a good group of Benias， Norwood，sent a good group of Begonias，\＆c．；Mring plants，and a collection of cut Roses；Mr．F．Frevor，Camberwell Green， Floral Decorations，\＆o．Mesars．W．S．ILes \＆Co．，Camber well，sent a good collection of garden Pottery．

## IRENTHAM HORTIOULTURAL．

Jour 25．－The eighth annual exhibition was held in the beautiful gardens at Trentham，and the display was even better than ever．Mr．Harry Veitch，of the Royal Exotic Nurneries，Chelses，in responding to the toast of the judges remarsed，that in aome departmenta the exhibite were better than any that he had witnessed in London．

## Groups

In the competitive classes the groups of miseellaneous plants arranged for effect were，as usual at Trentham，of high merit， and the judges had difficulty in satistying themselves，so c＇ose was the competition．Mr．Edwards，gro to the Duke of ST Was the competition．was placed lst with a charming group consisting of Albans，was placed 1st with a charming group consisting of ramosa，Alocasis，finely coloured Crotons，Ferns，Caladium argyrites，\＆er．2nd，Mr．C．H．Wright，Halston，Coventry with a collection including Aralia Veitchii，Areca lutescens， Pancratium fragrans，\＆c．Flowering Begonias were also used in this group with pleasing effect，the Selaginella cessia formed part of the groundwork，intermired with Maidenhair Ferns．
In a similar class，open to persons who do not employ more than one gardener，the lat prize was taken by F ．J Madnock，Esqu．，Alsager（gro，Mr．Smith），who had a neatly arranged group，consisting of Inora coccinea，Lilium auratum Palms，nice Cattleyas．Caladium argyrites，Ferns，\＆c．；2nd C．8．Jowes，Esq．，Stoke（gr．，Mr．Gibbs），who introduce Anthurium Andréanum，Cissus discolor，Coleus，and a well grown Areca latescens into his group，with Ferns，mosses，\＆c

## Roses．

The queen of flowers is always dominant at Trentham，and this jear the competition was very keen，grower，coming from all parts of the United Kingdom．The premier honour was secured to the Emerald Lisle．
Forty－eight Distinct Blooms，－lst，Mesurs．ALEX．Diokson \＆Son，Newtownards，co．Down，with fine blooms of Her Majesty，Marchioness of Londonderry，A．Colomb，A．K， Williams，La France，Senateur Vaiwe，thsir new seedling Earl of Dufferin，Duchess of Bedford，Mrs．J．Laing．Dr．André， Louis Van Houtte，Victor Hago，Helon Drew，Kaisorin Augusta Victoria，\＆c．；2ud，Mesors．Perkims \＆Sows， Ooventry，who had excellent blooms of Caroline Kuster Madame Eugène Verdier，Souvenir d＇un Ami，A．K．Williams， Madame Marie Verdier，\＆c．
Thirty－six distinct single blooms．－This class brought six competitors，the best collection being one from Mesers，HABF ress \＆8oss，Bedale．York，which included good blooms of A．K．Williamas，Her Majesty，A．Colomb，Maréchal Niel，J． S．Mill，Mra．J．Laing，Duchoseo de Morny，\＆ec．2nd，Messrs． A．Diekson \＆Sons．Kaiserin Augusta Victoria，Her Majesty， A．K．Williams，Victor Hugo，and susanne Mario Rodo canachi，were noticeable in this atand．
Twenty－four distinut blooms，three trusses of each．－Among nine competitors，the lat prize collection wis one from Messra， A．Dicissor \＆Soys，and amongat the blooms beot represented were Merveille de Lyon，Her Majosty，Mrs．Sharman Craw ford，Captain Haywood，Gustave Piganneau，Mario Banmann， John Stuart Mill，\＆c．2nd，Mesars．PEREINs \＆Sons，Coventry． Here were good trobles of Dulvo of Teck，Louis Van Houtte Marie Verdier，Madame Joneph Bonnairo，A．Colomb，ac．
Twelve distinet Toas or Noisetios，thrce bloomse of each．－lat， Mesars．A．Dicksor \＆\＆oxs；and we noticod Souvenir d＇un Ami，Ernest Motz，Porle dee Jandins，Innocento Pirola，Bridee maid，Catherine Mermet．Fravoisen Kruger，so baing worthy of remark．2nd，Mescrs．Prion $\& 80 \mathrm{Kin}$ ，Colchester．Niphotos Madame Hoste，Caroline Kuster，The Bride，Marechal Niel were the beat in this stand．
Kightwen dirtinet single blooms，｜Teas or Noisettes，－1 18t，Memers． Prior \＆Sows，with a atand in which were rery pood blooms of The Bride，Comtene do Nadmillac，Marie Van Houtto， Niphetoe，C．Kuster，Rubens，Boule dOr，Innocente Pirola，

Ivoere single blooms of any dark velvety Rose．－1st，ALEX Amper Dicison a Sows，with a fine stand of Earliot Dufferin 2ad，Mones．ToWmsend \＆Sow，Worcestar，with A．K．Will
hiams．
Twilve single blooms of any whits or light－coloured Rase，－1ut， Prop \＆Sov，Colchester，Mith．John Laigg；2ad，Messra， Twelve single blooms，any other colon．T．Laird．
Twolve single blooms．any other colour．－lith，Menors．Hisk－
ness \＆Sons，with Allred Colo nbe ；2nd，Mr．Gzorareyomm
For the most decorative arrangement of Roses， 12 feet lome 1 feet wide．－1st，Mesers．Jenkinson \＆：on，Newonatle，By fordshire，for a very artistic arrangement of baskets， prays，wreaths，and festoons，with Ferns，\＆c．si2nd， Chandos Pole Gille．Hopton Hall，with a collection ammen hiefly in low vases among Palms and Selaginellas．
In the amateur classes for twenty－four distinot bloomen for twelve distinct blooms，Mr．W．Drew．Ledbury，ma tif being followed in the latter class by Mr．Boyer．

## Cut Flowens．

For a collection of hardy border cut flowers，Messm，Inar NESA \＆Sons were 1st，with fine bunches of Coreopeis an difors，Delphinium grandiflorum album，Potentilla Vésuve，Chrysanthemums，Phlozes，\＆c．；2nd，Mr．Guma Mount，Canterbury
For twelve bunches of stove or greenhouse flower，Nem
Jenking \＆Sons were lat．Messrs．Jowes \＆Sows tury，had the best ball or hand bouquet；and Meerss Jham \＆Sows the best bridal bouquet．
The best stand of cut flowers for table decoration was otegi G Mrs．Blair，Trentham Gardens；2ad，Mim Kemps Market Drayton．Stand of cut flowers for table deantion and a simular class for nurserymen，was won by Yom JEMEINS \＆Sons．

Fruit made an excellent display
For a collection of nine distinct kinds，the lat prize wa hin by Baron Rothechild，Gunnerbbury Park（gr．，Mr．Regnolden who staged fine Madresfeld Court and Black Hambuy Grapes，a good Queen Pine，Belle de Doué Peaches，her Napier Nectarines，Brown Turkey Figs，Hero of Lachip Melon，Bigarreau Noir de Schmidt Cherries，and Pinemph Nectarine；2nd，C．E．Keyser，Esq．，Stanmore（gr，促 G：eoson），who had a fine clustor of highly－coloured Benm also Black Hamburgh and Muscat of Alexandria Graper，Bellir garde，and Early Alexander Peache3，Downton Nectarien and St．Margaret＇s Cherries，with \＆Ripley Queea Pine．
Collection of six varieties of fruit，excluding Pines．－－is Baron Rothsenild：here was staged ercellent Madrowiwl Court and Muscat of Alezandria Grapes，Hero of Inctiry Melon，Goshawk Peaches，Pine－apple Nectarine，and Bigmma Napoleon Cherries；2nd，Lord Bagot，Blithfield（gri， Bannerman），with Foster＇s Soedling and Black Bamiad Grapes，Golden Perfection Melon，Violette Hátive Puin Violette Hâtive Nectarices，and Browa Turkey Fig3，
Grapes．－For four bunches representing two distinet lint J．Graft Morris，Esq．，Allerton Priory，Livarpool（fr，监 Cravan），was lst，who staged exorllent well finithed Maind Cravan），was 1st，who staged exoflent well inizha apecial prize，as the most meritorious exhibit of fruit in show．2nd，Baron Rothschild，with the same varities
For three bunches of Black Hambargh Grapes，J．Ma Esq．，The Haye，Stone（kI．，Mr．Bates），was lat and J．Gur Morbis．Esq．，2nd．
For three bunches of Black Grapse，any variety，ith，J．awe Morris，Eyq．，with Madresfield Caurt，and special for bot of Black Grapes；2nd，Baron \＆OTHschild，for tho variety．
For three bunches of White Grapes，any variety，exily Muecate，Lord Hoteam（gro．Mf．Alsop）was 1st，mith finished Buckland Sweetwater．ind，Basiz Firzirasuid Eequ，Swynnerton Hall，Stone（gro，Mr．Turner），with
Melons．－The best green or white－fleshed Melon cand B．Fitzeerbert，Esq．，with Turnet＇s Seedling．2ma， Habrivgton，with Coustess．Mr．W．G．BeELSE， Hall Gardens，had the be st scarlet－fles
of Sion．2nd，B．Fitz herbert，Esq．
Peaches，single dish．－The Duke of Sutherlatin（f） Blair）had the best single dish，stiging a magnificont in Violette Hative．2nd，C．E．KEYSER，E，$q$ ，with Belleg
Nectarines，single dish．－1st，Duke of 8 utarbilli， highly－colourel Lord Napier．2nd，Lord BıG0T，with Fil Hâtivo．

sstions, containing shades of bright scarlet to almost pure white. The plants were well grown and profusely flowered. He showed likewise a group of some hundreds of Lilium longiforums, which were the admiration of all.
Memre. Veitci a gons, Chelees, staged one of the fineet groups of plants the firm has ever rent to the Midlands, and comprised a col'ection of new Carnations. Rhododendron jasminiflorum well flowered; the rewest Nepenthes, and Caladiums. New varieties of Cacda, for which a Gold Medal was awarded. The same nursery firm staged a fine collection of fruit, and a collection of 100 vases of cut flowers.
Mesers F. SANDER \& CO.. St. Alban, staged a choice colMears F. Sander \& Co.i St. Albane, staged a choice col-
lection of new planta, for which a Gold Medal was awarded. The group included a fine s?rimen of Dracena Sanderians. new Begoaias, Alocasia W itsoniana, Eriocnema Sanderæ, a foe new variegated plant; Dew Palms, Orchids, \&c.
Mears. Dickson, Ltd., Chester, Were awarded a Silver Medal for a collection of cut flowers, consiating of Roses, Gladiolus, Camations in variety, Phloxes, and other flowers of pereanial planto.

Mesorn. Cutbusir \& Sons, Highgate, had a Silver Medal for hardy cut flowers, including Carnations, Mesars. WEITe. \& Son. Worcester, Silver Medal for thirty-sim varioties of herbaceoas cut flowers, Gladioli, Gaillardias, Pompon Dahlias, herbaceous cut fiowers, Gladioli,
Mesors. EckPord \& Bor, Wem, were awarded a Silver Medal for fifty varieties of Sweet Peas, arranged in vases with foliage.
Mearp. Clibran \& Son, Altrincham, had a Silver Medal for a collection of cut flowers; Messrs. Hill a Co., Spotacrs a Silver Medal for a collection of shrubs in pots; and Messrs. Pbitciard \&on, Shrewsbury, aSilver Medal for a collection of eghty varities of border Carnations.

## HAMMERSMITH HORTICULTURAL.

THis part of cuburten London hap, of course, it b Horticultural Society, which doubtlese contrives to keep up a love of gardening amongst its heterogeneous population. The district was once well dotted over with large residences in the times when rich citizens were not conveyed as now by rail and coach so far afield to their homes, and there are atill existent legends of fine old gardens in and about Hammersmitb. Did not the mother of the present President of the Royal Horticultural society porses a ganden but a short way from Hammersmith, that was famous for rare plants and good gardening; and Kenaington, Chiswick, and Turnham Green were peopled with nurserymen, florists, and market gardeners. Who has not heard of the celebrated firm of C. J. Lee; of Salter of
Chrysanthemum fame, who escaped with Louis Philippe's fine china dinner service in 1818, whith he let select visitors beholr in his pariour at Versailles Nursery, Hammergmith, down to 1809, for the depesed King gave it to him, after it was brougt t over to this country; of Glenny, of Glendinning; of the famous Williama Bon Clrétien Pear that has made peoplo affluent both hereand in the United States of America, and which was found in a Turnham Green garden? Many of the formet owners of these gardens are dead and gone, and the land once theirs carries, alas, a crop of houses instend of fruits and flowers!
The Society held an exhibition (the eleventh) on Thursday, July 25 , at which were groups of plants shown by amateur and professional gardeners, Mr. Woonhouse being lst among the former, as 1 Mr. Brombey among the latter. Nice exotic Ferns came from Mr. Addison, Mrs. LLoYD's gardener, Merton Loder, Chiswick; and good Fuchaias were abown by Mr. Butcerfikid, a gardener.
Some non-compelitivo exhibits came from Mesary. C. LeE, of the Royal Vineyard Nureeries, and from Mr. PREWETT, 8wiss Nursery.

## CARNATION AND PICOTEE UNION.

JuLy 27 . -The annual show took place as unasl in the garden of the Cottage, Stanley Road, Oxford, on the above date, under the management of Mr. Medburat, son-in-law and successor of the late E. S. Dodwell. A isise lot of flowers were ataged, and admirers of the flower came from varione parte of the country.
Carnations.-As at the Crystal Palace, so here, Mr. Robert Gydenham, Birmingham, took the let prize in the leading clase for twelve Carnations, there being six exhibitors: Mesars. Thomson \& Co., Birmisgham, were 2ad, with a stand oply juat below the other. Four other prizes were awarded. There Were nine competitors with six varietien, Mr. C. F. Tharstan, Wolverhampton, being lat, and Mr. A. E. Brown, Birming ham, थnt, six other prizes being awarded.
Picotees. - Thera were five collections of twelve Picatees, Mr. A. W. JoFes, one of the Birmingham mateurs, taking the lst prize with superb blooms; Mr. R. Sydengam was 2nd; and four other stands received prizes. There were twelve atands of six Picotees: 1st, Me. A. R. Brown; 2nd, Mr. C. R. Thurstan. Nine prizes were awarded.
Selfs. fancles, and yellow-grouads. - Theso were superb, and perhape finer than were ever seen at Oxford. There wore sight stande of twelve blooms, Mr. A. W. Jonke taking the lst prize with a eplendid Int, some of the finest being Qladye, a pink self; Stadtrath Bail, Y.-g., very bright; Misy Audrey Campbell, a yellowish melf: Germanis, very fine; Javire, and Mr. B. Sydenham. Mr. R. SYDENHuM was 2od, and aix prizes were awarded in all. There were thirteen stands of six blooms: Mr.W. Spenter, There were thirteen stands of six very.fae lot; and Mr. A. B. Brown 2nd; six other prizes beivg awiarded.

Yellow Grounds on'y,-There were thirteen stands of six blooms: Mr. W. Read, the gardener at the Cottage, taling the let prizes; Mr. A. W. Jones was 2nd, and so good were the lst prizes; Mr. A. W. JONES Was 2nd, a
Single blooms.-A large number of these were staged, and many prizes awarded.
Premier blooms.-The premier Carnation who C. B. J.S.
Hedjerleg Madeline, N. R E from SYDENHAM: the procier Picote Germania, from the same: the premier Fancy, Firefly, soarlet and maroon, a sport from S.B.O.H. Herbert, from Mr. O. F. and maroon, a sport irom S. B. C. H. Herbert, from Mr. C. F. ThURSTAN; sind he pre
from Mr, W. SlemCer.
from Mr, W. SleENCER.
An excellent collection of bunches of hardy plante were staged by Mr. B. LADEAMS, Southampton; Dahlias by Mr JOKN WALKER. Thame, and Mr. T. ANstiss, Brill; and seedling border Carnations of excellent quality from Mr. W. Hovell, gr. to G. H. Morrell, Eeq., M.P., Headington Hill Certificates of Merit being awarded to each.

A large party partook of luncheon in the grounda under the preaidency of the Mayor of Oxford.

## ELOWER SHOW AT WELLINCBOROUGE

July 28. -This exhibition took place in connection with the periodical meeting of the Northamptonehire Agricultural Society' show, and was the means of bringing sngether, in the clanses open to all Eogland, exhibits of high order of merit. Handsome money prizen were offered for twelve atove and greenhouse plants, diseimilar.
Mr. J. CyPEER, nurseryman, Cheltenham, took the 1st prize with grand examples of Kentia australis, K. Belmoreana, Latania borbonica; a magnificent Croton Sunset, C. angustifolius, and Cycas circinalis; s remarkably good plant of Erica Austiniana, E. tricolor vera, Fhoenocoma prolifora Barıesis, Izora Williamaii, \&c. Mr. W. Finch, gr. to J. Ma rriott, Erq., Coventry, was 2nd, with a collection of similarcharactor. Erq., Coventry, was 2nd, with a collection of similarcharacter.
The beat plant proup came from Mr. W. Vause, nurseryThe beat plant group came from Mr. W. Vause, nursery-
mav, Leamingcon; Messrs. H. \& E. Lack. nurserymen, Wallingborough, were 2nd.
Wellingborough, were 2nd.
Mr. Fincl bad the bert
Mr. Fince bad the bert six fine-foliaged plants: Mr. Vause taling the and prize.
The beatspecimen plant was a magnificent example of Zamis Vroomi, some 16 feet in diameter, and having seventy to eighty finely-developed leaves, shown by Mr. C. Wilkins, Wellingborough ; so large was it that accommodation had to be found for it in the open. Ferns were well shown in both dswisions; in the open c'ass by Mr. J. Copson, Cottingtree, who was 1st; and in the gardeners division by Mr. D. WıLKER, Wellingborough. In the gardener*' division Mr. FLNoE had the best six stove and greenhonse plante, all in flower: Mr. the best six atore and preence. Foliage plante, Caladiume, Copson taking 2nd place. Gorinias, Fuchsias, Coleus were good.

Cut Flowers. - The open class for twenty-four Roses brought a good competitiod, the Rev. J. H. Piemberton, Romford, taking the lst prize, having fine examules of Mrs. J. Laing, A. K. Williams, Comte Rainbaud, Caroline Testont, Ernest Metz (Tea), \& 0.
With twelve varieties of Teas, the Rev. E. G. KiMG. Gayton, was 1at, having good examples of Princess of Wales, Madame Oasin, Marie van Houtte, and Hon. Edith Gifford.
The bent twenty-four bunches of cut flowers came from Messra. T. Perkins \& Sons, wurserymen, Northampton. In another division for twelve Roses, come good cut bloom of Z mal Pelaryontums and double and single Begonias wert staged.
Fruit in quantity was limited, but in quality good. The beot collection of fruit came from Mr. Hariss, The Gandens, Castle Achby, who had Grapee, Pine-apple. a Melon, Peaches, Nectarines, ad Goomberries. Mr. D. Percival. Welling borough, hed the beat three bunches of Black Hamburgb Grapes. Mr. J. Curpatons, Dingley, was the only exbibitor of white Grapes, haviag Foeter's See Hling. Some good Peach s were shown by Mesire. Irons, Spratyon and Copson, also grod early prolific Plume.

## T. H. Rabone.

In our lant issue we contined oarselver perforce to the mere mention of the decease of Mr. T. H. R ibone, the well-known gardener at Alton Towers; A full accoant of his career up to the date of pablication was given in our isaue for October 14, 1876. From this it appears that Mr. Rabone was born in 1833. In boyhood and youth he ererved in the gardena at Wellesbourne Hall, Walton House, and Packington Hall. In the laet-anmed place be tells us he had eleven fires to see to on \& winter's night, but Where he nevertheless educated himself by dint of perseverance. From Packington he went to Shrabland, and thence to Trentham, where he came auder the tuition of Fieming. From Trentham he went to Barlaston, where the lessons be had learnt were turbed to account, and he became a diatinguished exhibitor, as also when he wat at Elart's Hill and Woodseat. At the great Hortoraltaral Show at Leicester he took the lot phize for diery dith of fruit he exhi-
bited, six in number. Thence be proceeded to Alton Towerp, where he had the supeintendence of the garden, the woods, and the eatate renerally. The cloning paragraph of the antobiggraphical note, from which the above particalare are taken, ends thas-". . . it mesy be that when you are dend and gone your memory will be recalled with gratitude and tears." How trae this was ol himeelf is shown by the following extract from a local paper :-" Tbe Earl of Sbrewabury came down epecially from London on the 19/b intt, on hearing of Mro Rabone's, rerious illness, in order to see him and exprese his deep aympathy with the family. Telegrams were despatched and received several timea each day from the Earl and Countess, and other members of the family. On hearing the and intellizence on Saturday of hia death, the Earl ordered the flag to be hoieted half-maet high on the Towers, and so it rewained till after the funeral. All the blinda at the Towern were drawn, and the ground closed till ater the faneral. By all denomination the deceased was greatly respected. He was on the Board of Gual diane for Cheadle, wat ditetrict Councillor for Furley, and a parish councillor. He was a Freematon, and Past Master of the Foreaters' Lodge, Uct (x-ter, and Patt Provincial Grand Swordbearer, Steffordehire. The deceased, though a Wealeyad, retained the greateat affection and love for the Church of Eogland, and was by his own request buried with the sites of the Charch in the consecrated portion of the additional churchyard at Alton. The coffin was sent by Mr. Mynors, his lordehip's agent at Ingestre, and was made on the eitate there. The procention was headed by Mr, W. C. T. M $\mathrm{M}_{\mathrm{n}}$ nors, representing the Earl, and Dr. Hall. At the charch gates the body was met by the local clergy and dimenting mininters, and the Rev. R. Barr tt (Weslegan minarter, Cheadle), the Rev. W. C. Greene (vicar of Oakameor), the Rev. C. J. Winser (vicar of Market Drayton), the Rev. C. B. Tyimbitt (vicar of Cauldon), and the Rev. W. T. Nirton (Denitone College). On reaching the church, Mr. Ba'low, his lordship's organist, played "O rest in the Lord." The moarnere were the Rev. T. H. Rabone, Mr. Henry Rabone, Mr. Frank and Cbarlie Rabone, the Rev. R. Murphy, and a large body of tenantry and friende. Amongat thowe who sent floral tributes, numbering nearly aixty, were the Earl of Shrewabury and Ta bot, the Countess of Sbrewabary, Viacount Ingeatre, Lady Viola Talbot, Tberesa Countess of Shrewabary, the eatate workmen, the gardenera at Alton Towera and Ingestre, the arvanta at the Towers, and many othere.
Mr . Rabone earned for himself the proud title of the gardener's friend. Letters from some of bis "young men" are before na tentifying to the easential goodneas of the man and bis kindneas of herr:. In Dean Hole's Memories is the following parsage:"Solace comen to joa with the real enthusiast, who shares your admisations, your auccesses and disappointmente, as thuagh they were his own; who is as anxious to rective, as he is willing to give information; an gratetal as he is generoun. How quickly and bappily the hourt go, as in his garden, or in yours, or wherever your favourites grow. you suggent to each other new charma, new combinationt, new methods of calture. I went to one of the most beantifal of our preat Englioh gardens, and meeting the head gardener, atked permisaion to walk tarough the grounds, and told him my rame. Tomy momentary sarprise he made me no answer, but turning to one of his men at work clowe by, bade him 'set the fountaing playing.' That was his brotherly welcome; and it atirred other fountains beside thone which suddenly arow and aparkled in their ailvery wheen, and made my heart glad. In thie deliyhtful garden there standes atatue of the noble owaer who reclaimed it from the wate, and underneath an inscription. 'He made the desert mile, and so our love of flowers and forite maken green spots on the path of time.' In this land of gardene the gardeser bas troops of friends, and even in places which the world calls desolate, he thall find companions to cheer him, to long se there are Lichens on the mountaine, Ferns in the ralley, or slgat on the abore.

The wildernens and the solitary places aball be glad for him, and the desert thall rejoice and blosmom an the Rowe."
Mr. Rabone rarely came among hia Metropolitan colleagues, but he wan well known among them as a good gardener and a mont conacipntions sympathetic man, ever ready to do good to oth $\sim \mathrm{ra}$.

## MR. A. F. BARRON'S RETIREMENT.

Thr announoement that Mr. Barron is shortly to retire from the direction of the hallowed gardens at Chiswiok will oome as a surprise to many and a shook to some. No doubt the Council of the Royal Horticultural Society have given the matter the most anxious consideration, and have convinced themselves of the expediency of the step in the interests of the Society and of Horticulture generally. Moreover, they oannot have failed to remember the prolonged and unique servioes whioh Mr. Barron has rendered to the Society, and the retiring pension offered to him will doubtless be proportionate to the means at their disposal and to their sense of the value of his services. The older members of the Council have surely not forgotten the staunch, unwavering loyalty whioh Mr. Barron displayed during those wretohed years of the South Kensington management, when Chiswiok was allowed to fall into a miserable state of disrepair. At that time the direction of the garden must have been a constant souroe of depression to the Superintendent, intensified as it was by an abiding sense of the precariousness of his position. This state of things has happily passed away. Chiswick has been put into good order, and horticultarists long to see it the exponent of progressive hortioulture, and the trial ground for all that is promising and instruotive. They do not oare to it competing with marketgrowers in the sale of Grapes, and they think the services of the staff might be more profitably employed than in growing for distribution among the Fellows plants which are readily to be purchased for a few pence at the nearest florist's.
But leaving these matters aside for future consideration, the one uppermost feeling in the minds of those who are familiar with the work of the Society is, that Mr. Barron should not be allowed to retire without a tangible expression of goodwill and admiration on the part of those who have witnessed his efforts or benefited by his help. His name has been synonymous with staunchness and loyalty. Under circumstances always difficult, not unfrequiently perplexing, and sometimes, as we have said, depressing, Barron has set a fine example of steadfast devation to duty, whilst outside his official daties his work as the anthor of the most popalar book on Vine cultare and his services to the Gardeners' Orphan Fund have given him a claim to the warmest acknowledgments on the part of his friends and associates. In this matter we feel we are bat expressing the feelings of many others, for even before the matter was pablicly known we have been in receipt of many letters, expressing the same views. It is needless to say that we shall feel it a privilege to co-operate in the matter and to assist in whatever may be determined upon.

## Nursery Notes.

## MR. DOUGLAS'S CARNATIONS.

Tre little atation of Bookham on the Lo \& S . Wentern Railway, about 20 milen from London, and in one of the prettient dietricte of Surrey, in but
little frequented except by achool-children and others from the metropolin, who have found the place to be a saitable one for their annal excarsion. Since, however, Mr. Douglas has commenced his pursery within five minates' walk of the place, there have been attractions to the florista also, and these are likely to become atronger each season. It was Mr. Dongla, Carnations we joarneyed to see last week, wondering as we did $\mathrm{so}_{\text {, what }}$ whind of a display we bould witnens after the extraordinary character of the weather since Chriatman. A peep into the first house to be neen, however, was anfficient to asmure un that the renult of unfavoarable weather was not very evident, and after pasning through two of these all filled with excellent pot plants, with large stout flower-stems much branched, and bearing countless blooms of atriking quality, the conviction was forced upon us that the journey was little compared with the return to be found bere, which was such an one that any admirer of these flowers would be satistied with. Mr. Douglas bas long been known as a raiser of new Carnations, and judging from the far greater namber he has of seedlings this season, be will be better known in the future; but the varieties at present aperior to any others of their sort are those which have been raised in the garden of Martin R. Smith, Eeq, Hayes Common, and which are sent ont by Mr. Douglas. Each of these admirable varietien is grown in numbers here, and from the abandance of bloom, the effect of each compared with the other can easily be noted. Mrs. Eric Hambro is the most meritorions of all. It flowers are pare white, very large, being 3 inchen in diameter, and of the most perfect form posaible; the petals are flat, and the bloom nearly circular. This handsome new variety is one of the finest white varieties ever sent out, and the habit of the plant is strong and free-flowering. Lady Ridley will, perhaps, be equally admired; the flowers are not emaller than the one just detcribed, but the form is not quite so perfect, and the colour in lem pare, inclining to cream. It habit, however, is very commendable, especially the tout footatalke, which make tbe plant so erect in flower. A charming new rose-coloured variety is found in Sadek; the rose is rich and deep, rather peculiar in tint, and very pleasing. A large quantity of bloom was in perfect condition, and its erect and vigorous habit make it apecially desirable. Bendigo has violet or bluish-purple flowers, growa lesa tall than many kinds, but in habit it is very aturdy, erect, and vigorous. Braw Las has brighter rose flowers than Sadek, and they are of large size and good form. Some of the very largest had aplit calyces, but the occurrence was not frequent, and was not to be seen at all in cases of necondary or amaller blooms.
Only four new yellow - ground Carnation and Picotees are to be sent out during the coming season, and of thene were noticed George Cruikshank and Cowalip. To speak of the last-named firt, Cowslip is a yellow-ground Picotee, with edging of bright rose. It is a good grower, and we could detect no aplit calycen; the blooms are of commendable form, and apparently the variety is a late one, as there were fewer blooms expanded on thene plants than ou othern. George Cruikehank is an excellent Carnation, of the type of Victory, and although distioct from Cardinal Wolsey, which was sent out last reason, it is of the same type. It has a boffground, and is flaked with crimson or blood-ren. The flowern are very large and extra full, calyce good. In addition to these that have not yet been cont out were the collection of the new ones of lant season, wuch a Cardinal Wolsey, which we have just mentioned, Hayes' Scarlet, which is certainly the fineat carlet Carnation ever raised; Dake of Orlesn, dark shade of yellow; Misa Audrey Campbell, brimstone-yellow; The Hunter, rich Alricot-yellow; Cormona, pleasing golden-yellow; Waterwitch, extra large, and of the most delicate blush; Mephisto, Iovely crimen, and notably good form; and King Arthar, an exceedingly lage flower, 5 inche in diameter, of acarletcrimeon, extra goed for a border. Other, goed Carnation are Snowdon, a large white flower of rather
indifferent form, but valuable for a border; Endoxin, a large flattish flower of almon-rose; Pride of the Garden, another rome-coloured variety, apecially anitable for borders. These last three were rained by Mr, Douglay, as were also the following Picotent: Ladas, clear yeilow ground with thin scarlet edge, good flower and stout petals: Mr. A. Tate, yellow ground, edged and marked with rich red; Preaidens Carnot, yellow ground, heavily edgad with roas. acarlet, flowers of considerable aize and good in form; Mra. Duuglas, one of the most attractive, having apalo yellow ground, with rose edge, and of very fine form; Mrs. Dranfield, with yellow ground, is rather hearily edged with palerose. A new velvety-criman Carnation of exquisite form, named Henry Irving, and raited by Mr. Douglas, well deserves notice; and also a aporit from the new yellow-ground Picotee Mre. Gooden, which we think will be a valued one. Considerablo work has been done in the narsery since we last mur it. Roadway have been made, and a dwelling hone is in course of erection. More sace than here tofore has been planted with seedling varieties of Carnations; and in spite of a seanon remarkable for it lack of moisture, the whole collection looks healthy, the planth are well flowered, and there an many amongst them to which the future belong,

THEPABTWEEK。
THE following summary record of the weather throull the British Islands for the week ouding Jaly 27, is form from the Meteorological Office:-

The weather was again dull and unsettled very goprilin with frequent and heavy rain in nearly all parto time to tim dom. Thunder and lightning also occurred from time to in almost all districts.

The temperatur slightly exceeded the normal in is land, E,' and the "Midland Ccuntips,' as Well asd; ' - Channel Isfande,' and just equalled it in 'Engrand, to S.W.:' elsewhere, however, it was below the mean rilut deficit amounting to as much as $3^{\circ}$ in " Scotland, H. and
and $2^{\circ}$ over 'Ireland.' The highest of the maxima were recorded on the 26th over England, but on varying dates in Ireland and Scotlant; they ranged from $78^{\circ}$ in 'Enqland, E: $87^{\circ}$ in 'England, S.,' and $76^{\circ}$ in the 'Midland Counties,' to $89^{\circ}$ in 'Ireland, N.,' and $68^{\circ}$ in 'Scotland, $N$.' The lowest of the minima were registered on the 23 rd, and ranged from $33^{\circ}$ in 'scotland. N.,' and $40^{\circ}$ in 'Scotland, W.,' to $49^{\circ}$ in 'Eng land, N.E.. S and S.W., and to $56^{\circ}$ in rhe "Channel Irlands.'
'The rainfall just equalled the mean in ' Scotland, N.,' but greatly excreded it in all other parts of the kingdom. In many districts the total fall for the week was abour three times as much as the mean, while in 'England, N.E.,' it was more than four times the mean. The largest amount messured at any iudividual station during the week was 3.54 inches at Alnwick Castle, and was five times as much as the mean for the period.

The bright sunshine exceeded the mean in some parts of the north of 8cotland, but was very little prevalent elsewhere. The percentage of the possible duration ranged from 34 in the 'Chanvel Lelands,' and 38 in 'England, E. and the Midland Counties,' to 15 in 'Ireland, N.;' 14 in 'Scolland, No,' and 12 in 'Scotland, E.'

## Tbade Notice.

We nuderatand that Mr. A. Evaks, head gardener at Lythe Hill, Haslemere, han begun buoineen an a fruiterer, florist, and seedaman, in Havlemere.

## ENQUIRY.

## SEEDS.

Lownor: Su'y 21.-Mesars. John Shaw * Sons, Seed Merchants, of Great Maze Pond, Borough, London, S.E. report an ircreazing sowing demand for Mustard and Rapo Beed. Prices for both articles stabd at a mororate level. Rather higher prices for Trifoliam are reposted frem Frapeo.

- Owing to the large increase in our circulation, we are reluotantly under the neoessity of going to press some hours carlier. Our contributors, who woll know what this implies, wit kindly aid us by sending their communications as early in the week as possible. Communications should rench us not later than Wednesday.
** Plasts, Frotis, xto., to er Nanki--Correspondente onding plaxts or Aruits to be mamed, or asking questions demanding time and rewarch for their solution, muet not ampect oobtain an ansuer to their enguirtes in the curront woek. Spectmens should be good ones, carefully packed and numbered, and not more than six should be sent at ons time. Leavee onily, or Florists earieties cannot, as a rule, be named.
Adderss: W. T. Pablinhed by M. Doin, Paris.
A Red-coloured Cabnation uspd in Augteia and Switzreland for Filling Window- boxes: Florist. Probably Carantion Margaret (Margaretben Nelke), large-flowered, dwarf of habit, but various in colouring.
Brauty or Bath Apple: Geo. Cooling. An excellent desaert fruit, pleasant in appearance and flavour.

Canmas: A. W. $M_{\text {. }}$ Austria. The bloome reached ue in such a withered condition that it was impossible to prononnce any opinion apon them, save that the flowers were maller than thoae we are now accustomed to see

Serdeting Carmation: G. B. A good variety, orange-pink, but we cannot may it is better than other.
Correction.-Among the list of candidates placed in the First Clase at the recent examination at the Royal Horticultural Society, the name " Micklethwaite" wat erroneoucly apelt "Macklethwaite.'
Formen Wood and Nuts: J. P. If you will kindly aend your foll address we will commanicate with you by letter.

Grapes: A.J. B. and A.S. Your Grapen are affected with " mpot," the work of a fungus. Another year try the effect of spraying with Bordeaux Mixture when the berries are small.
Grmenhoder Ferns from Sporrs: J. W. Many apecien anch as Pieris tremula, P. serrulata, P. aspericaulis, Aduantum capilus-veneris, Aspleninm aeveral apecies. viz., alatum, erectum, and flabellifolium; Crstopterie tenaie, Lomaria gibba, Nephrodium molte, Polypodiam pectibatam, Scolopendrium in varisty, Woodoia obtusa, and others. In a damp house the spores germinate abundantly, and can be made to attach themselves to suitmble abotances, anch at lump of peat, soft bricks, porotus plater, and dead wood; or they may be sown in pans thinly, the pans being flled with andy peat or peat and loam, over abuadant drainage materials. Asplenium of ame speciea, for intance, may be 18 month in appearing, and there thould be no hurry to throw a pan of apores away; on the other hand, there are species which ahow the prothallas in a fortaight.
Lachenalias: T. T. The bulbe are attacked by a fungus-Sclerotinia bulboram. Leave all affected bolbe for fifteen minutes in a rosered molation of potataic permanganate, shaking well so at to inaare the wetting of every part. Attermarde dry in a current of air. G. M.

Melons Diskaszd: Cd. M. Phoma lagenicola, a minute fungus, it destroying the Melon plante. Wash the aisessed parte with 1 part paraffic in 70 parta water, alchough it is probably too late to do anything with the present crop. Burn all diseased portions, and either change the soil, or sterilive thoronghly before planting again. G. M.

Naups of Plasts: Correspondents not ansocered in this isews are requested to con wht the next number. -Comstant Reader. 1, Campanala latholia: 2 Deutzia crensta double-fowered variety, - A W Mayer, Nied. Stanhopea tigrina.-Rio. Andronace lanuginona. - W. J. Lysimachia thyrsillora - D. D. H. Staptylea pinnsta, -X Y. Z. Cuncuta epithymum, Lewer Dodder.-E, M. Echiconpermum sp., perhapa E. Lappula. Look at the bur
with a magnifying glase.-No name. Eryngiam alpinom, Chrynanthemam lacastre, Lobelia car-dinalis.-A. J. B. 1, Inula AD.; 2, Riccarton Fachaia; 3 Bocconia cordsta; 4 Helianthastigidas; 5 Chryannthemam lacuatre; 6. Stipa pennata. N. C. 1, Achilles Ptarmica, double: 2, Centarrea moschata, Sweet Sultan.-W. H. Eria stellata J. I. 1. Polyutichum veatitum; 2 Lastrea glabella; 3, Gymnogramma ochracea; 4, Gymnogramma (Dictyngramma) japonica variegata; 5, Pteris hastata; 6 Lastrea strata ; 7. Wood wardia radicans: 8, Doodia candata; 9, Asplenium feociculaceum; 10. Lastrea serra; 11, appears to be a wealk, barren frond of Pteris tremula; 12, Pteris longifolia. You have sent double the number we undertake to name; a small contribution to the Gardenern' Orphan Fand would be gracefal compenation on your part for our trouble and time.-F. Y. Celaia cretica. Constant Reader. 1, Maranta zebrina; 2, Pandanae graminifoliue; 3. Dieffenbachia nobilis ; 4. Draczona Lindeni; 5, Anthurium Scherzeri-anum.-R. C. Filey. D-ndrobiam Bentonx and Epidendrum fragrans.-F. P., co, Monaghan. The beat form of Epidendram fragrave and Bletia Shepherdi. - W. Macdonald. Your variety of Odontoglosum Uro Skinneri is the finest we have seen. The flowere of Cattleya labiata Gaskelliana exhibit a carious departare from the normal form. We will refer to them at length in a later insue. - S. Maddox. We do not andertske to name floriats' varieties of any plant. - Disca. Eryngium alpinum.
Thonley's Powders for Hobses axd Musiboom Duse: Head Gardener. We have no experience in the matter, but we shou'd anppose that if the horse-food conaiste of chaff, hat, Beans, and Oats, the manare would not be rendered ansuitable for makiog Mushroom beds. The litter from beneath horses treated medically should be discarded.
Towatos: Burbach. Your Tomato fraite are attacked with "Black-rot," caused br the fungus Peronoapora lycopersici, bat the damage to the foliage is due to the presence of another fangus, known as Cladosporium fulvum. The best antidote is the Bordeanx Mixture, the formula for making which was given in our isane of last week in this column.
Vina Roors Decayed: Market Gardener. A moured soll, with water probably atagnant in it.
Tellow Raspberby "Bride or Suphrlativa": J. Merryfield. A fine vigorous plant, with large fraits that were however almost flavourless, from having been exposed to heavy rain for a long time. Send ngain when in better condition. There are too few yellow varieties in cultivation.

\&ATURDAI, AUGUST 10, 1895.

STREET PLANTING.

AENUES in the country, if but onoe rightly planted on the right soil, and then left to themselves, are sure to reward suoceeding generations. No oountry in the world boasts so many superb Beeoh, Birob, Oak, and Elm as does our own land. Our parks, royal and private, are one of the pripoipal attraction for our Amerioan consins, and not less for the dwellers in Europe generally, since a tract of country almost equal in extent to all England may be searched for in Germany or even in "fair" France without finding one such vista through a double series of fluted columns as scores of our nobles' and even commoners' seats afford.
But the question to settle here is-how far can we sucoeed in oultivating avenues in a great oity? Can we keep horses alive and well in mines? Time was when such an idea would have been ridiculed. To habitaate them even to oity life might well have been deemed a hopeless undertaking by those who knew them only in prairie freedom. But first by acoident, and then by scienoe, the one and the other doubtful point has been oleared up, and the tree has been found to be as ready to adapt itself to painful oiroumstances as was the horse.
It behoves us, however, to know preoisely to what extent such oonditions of life must be painful in the case of the tree, and what is nowadays being done to alleviate at once itsown lot, and that of the human and equine denizens of the town. As regards the initial step towards the attainment of our objeot-planting-look at the splendid boulevards which have sprung into exiatence on or slone to the site of ancient bastions in continental towns, such as Florence and Geneva. One might suppose that the planting of these was effected with no toohnioal knowledge. But the faot is, that masonry rubbish, though valuable in admixtare, is fatal in all but the wettest seasons to trees, even subarban; and unless preoautionary measures are adopted during the levelling, great expense is afterwards entailed in removing the soil and refilling upon the planting sites. In some towns on the Continent, the pleasure-grounds anthority shoulders all swoh expense, and co-operates with the street-bailding department in eoonomising labour of this kind; and it is this fundamental preparation which, in unoonfined places at least, amounts to a gaarantoo of future Champs Elyaées.

Moner will do almost everything. It is all bat omnipotent; and the London Connty Council is proving that sufficient of it oan be raised in London to execute any highly important improvement. If it be possible in London to widen atreets, lying quite near the City, suffioiently to plant them with trees, it cannot be impossible in any other of our great oentres to purify, moisten, cool the air for such unfortunates as muat parsue their avocations throughout the hot months. The indispensable
widening of streets with a view to leafy avenues is doubtleas costly, and may, in a few cases, be beyond the reach of the community, but for each noble tree-lined thoroughfare penetrating our most densely populated urban districts, there has been, and will ever be, a notable decrease in our dootor's bills-an advantage, to say the least, inveraely proportionate to the outlay on such a street. To dweller and worker in the adjacent houses, equally with the pedestrian or the traveller by vehiole, the benefit is admittedly immense. This embellishment, this hygienic improvement of our towns, should be more oultivated by all local bodies as an "art of peace" of vant, if not of paramount, importance. Were the true economy of this art better understood by suoh anthorities, the rates, even though clightly inoreased, would be more oheerfully paid.

It should beoome true of every city, that there be within it no important point of atreet-intersection from which no green leaf is visible. Where little has yet been done, it will be necessary to set aside annually the sum of $£ 1300$ for a town of 50,000 (this is an average sum, and must vary with the extent of pleasare grounds), and from $£ 200$ to $£ 250$ for eaoh 10,000 additional inhabitants. Let a good gardener be seleoted-one to whom much freedom may safely be acoorded in the management of all the public pleasure-grounds, as well as of the street plantation. Then, not even the poorest wil need present any real difficulty. The most arid sand, or the stiffest clay, no more imperatively than ordinary soils, must be trenched $3 \frac{1}{2}$ feet deep, and as wide, before planting. The difference in the former oase (bad raw material) consista in the bringing-in of good soil to the extent of from one-third to one-half.

Some large German oities (Dresden and Magdeburg), having to deal with hungry sand, underlain only at a great depth by clay, have boldly inaugurated a system of underground watering, and this, though at present only tentative, has so far (some eight years) given good results.

The system may be briefly explained. The general oity water-mains are tapped by a secondary shallow-lying conduit at the head of a street, and from this diverge the tree-feeders at regular distances of 8 feet, their contents disoharging themselves slowly through a small bed of old mortar into the prepared ground. The whole syntem lies only 15 inokes beneath the surface, is ventilated by apright open shafts at every 11 yards, and is, of course, emptied by a atop-cook in autame.
Some fine trees ocoupying cornerl or paved square centres are deemed worthy of a separate system-viz., a conduit forming a square around them, with vertical as well as horizontal feeders, eaoh one foot long, approashing the roote on all sides, and at differing depths.

Iron tubes are used throughout, and it in reokoned that these will do service for fifteen years, when the trees would be very strong, and oould, perhaps, take oare of themselves, if given liberal bresthing and drinking space around their stems.
The average cost of tree up to two years, atriking the average from all situations within the maniogal limitu, will be from 180. to 208 . In small towns leas.

As to the bent kinds of tree for the parpose, one must, of course, be guided to some extent by knowledge of the locality, but seeing that "variety is the spiee of life," and that the trenohing must in all cases be thoroughly done, it is to be expeoted that six out of the eight, comprising Oak, Elm, Horse-Cheetnut, Ash, Lime,

Maple, Plane, and Syoamore, find places in the interior; all the rest-the Servioe, the Mountain Ash, the Hawthorn (red and white), Beeoh and Hornbeam, Birch, Aoer Negando, black and silver Poplars, Willows, and shade Acaoias, the smaller and more pendent trees, in the outlying streets and saburbs.

The laciniate Oaks bear town life almost, if not quite as well, as the favourite Acer dasycarpum, which is at once the most attractive and the most traotable, as far as mere foliage goes. Other Aoers, suoh as piotum, are much esteemed. Esoulus, of course, startles and delights as all in the spring with the grandest flourish, "and the most handsome exhibit of its kind in the world; but the Ash, "queen of the forest," deigning also to reign here, outdistances the Horse Cbestnat in autamn.

None of these trees, whatever their root advantages, will grow well under the shade of a solid phalanx of high buildings, unless planted at a minimam distance of 6 yards therefrom, and line a street of at least 12 yards between their rows. From the edge of the pavement they must be set back fully 24 inches, or they will, sooner or later, suffer serious damage from overladen or swaying waggona.
The trees once planted, three gardeners are sufficient to take oharge of as many as will be found in an average town of 100,000 inhabitants, unless underground watering be in vogue, when another will be required. The duties of these are the following:-

Spring: Bind the nurselings with list, and ayringe. Stake substantially and fasten seourely with strips of strongest sail-cloth (sometimes waterproofed), nailing the ends to the stakes. Placeiron or basket-work soreens around the stems. Whilst sap is rising, tar promptly all barked spots on tranks, including the torn bark edges. Dish the ground twioe during the growing season above rooks; or, in case of completed paving, lift gratings and remove rabbish. As summer advances, lop some lower boughs of all in vigorous growth, to drive them upward. Syringe as frequently as possible throughout their first year.

In winter, re-stake, re-tie, prune, lop, and see to leaders. In botanioal and horticultural matters generally, England is now admittedly in the van of progress; but in forestry, as in urban tree decoration, she has yet to steal a march on some of her continental neighbours. Some few of our towns, of course, form pleasant exoeptions. The general richness of our landscape, unrivalled in any country of the temperate zone, makes a treeless town more unsightly by contrast; and the extraordinary rapidity of our journeys-of our transitions from town to oountry, and vice versá-make the contrast yet more notioeable.

Let us yet again in this matter signslise ourselves. In every fresh step towards priority of merit, we shall ourtelves reap all the advantage.

## New or Noteworthy Plants.

## TCHIHATCHEWIA ISATIDEA.*

Tenf firat thing the English reader will aak when he mees this impracticable name is how to pronounce it. M. de Tchihatcheff was a naturalist of foremost rank, whose work on the geography of Asia Minor in a atandard production. To botanists, therefore,
he is or was the bearer of
"A name which they all know by night very well,
But which no one can apeak and no ove can elll."

[^9]In order to gain information as to the proper promunciation, we applied to a Rassian friend, from whose instructions we arrived at "Tchĕ-hátch-off," with a atrong atreas on the second ayllable, as the neareat approach of which we are capable. The name was Latinised for botanical parposen m "Tchihatchewia"!
For our illastration (fig. 29, p. 151) we aro indebted to Mr. Lynch, the Curator of the Cambridge Botanic Garden, in which establiahment it flowered this year, as also in Mr. G. F. Wiloon' garden at Weybridge. It is a Crucifer, native of the mountains of Armenia on the north wide of the Eaphrates, where it grown at a height of 5000 to 6000 metres, and where it was discovered by Tchihatcheff. It was introduced into cultivation by Mr. Max Leichtlin, of Baden Baden. The plant it a dwarf biennial of tufted habit, with a flenhy taproot, aessile, rancinate leaves, covered with atiff white hairs. The flowern are numerous, in clone terminal paniclen, 20 centimètres acrow; ach flower is of the size of that of Hesperis (Rocket), romslilac or rose-coloured, and fragrant. After flowaring the flower-atalk is bent downwards, no that the silicle becomes appreased to the stem. It contains one or two black seed.. M. Marc Micheli dencriben the plant at length in the Revue Horticole, and gives analytical details with which our own aketchen, taken from the Cambridge pecimen, entirely correapond M. Micheli says it is without doubt one of the prettiest rock planta yet introduced. It liken fall exposure to the sun, and itw stout stalks bew innumerable rose-coloured flowers, which contrut with the long white hairs of the leaves. It is quito hardy, having survived the last winter at Geners withoat protection.
The plant is one of botanical interent, and appeare to be rare. Bentham and Hooker, in thoir Genera Plantarcm, aly that they had not neen ih, and copied the dencription of Boisaier. The co-operttion of horticulturists with botanists has here then, as in to many cawen, been of apecial value to weienca, $M_{0}, M_{0}$

## THE FRUIT CROPS.

IN our laat ianue we gave a synopais of the numerous reporte as to the condition of the fruit crop we had received from all parta of Grat Britain and Ireland. Taken as a whole, the report is uniform in its character, and favorrable as regards both quantity and quality.
The veanon of flowering was later than unual, and there was a very geaeral immunity from sharp froth, although the temperature in most part of the country wat dangeroasly 10 w , and front of nont severity was felt in certain localities in widely 4 ppo rated parte of the country.
The tabular matter already published doer aot allow of mach detail being given, and the grat degree of uniformity in the fuller reporta wo hav received from the kindness of our correspondenta renders it annecemary to publish more than a weot tion of them.
0. SCOTLAND, N.

Moraysulre, -The frait crope look well, and asi! whole they are three weelk in advance of lant nemotis but the weather has been very unateady; hot and cold in turns, and late-keeping varieties will prozt greatly by a warm, dry autumn. Wm. Ogg, Dupu House Gardens, Elgin.

## 1. SCOTLAND, E.

Abrrdiznshibu,-A fow Apple trees on wall have a good crop, but atandard trees are under the average, and the weather having been cold and dry when they wers in blossom, growth is atanted, the wet was a poor one. Pears had very little blow nom, but that which set in fairly good in appearnach Plume and Cherries, fair cropm, are doing well. Forrest, Haddo House Gardews, Aberdeen.

- This is not a fruit district at all; only a ralf few sort are of any use here. We are very arbject to late pring and early autumn frosta. Geomeariteh Carrante, and Strawberries are an extry crop sadich qood \#avour. John M. Iroup. Balmorel Cautle Gardim

Banfrsirge-The fruit cropm, on the whole, are a fair average. Peachem and Apricots showed a fair percentage of bloseom, but owing to the cold night and badly ripened wood they set badly. Pears, on the whole, are a good average. Apples were most abandant with blossom, but have et very thinly; the very dry weather prevailing daring the flowering seemed to exhauat them, and the fruits have dropped badly. Figs on the open wall, which umaslly do well, have affored from the froste of winter, the temperature having gone down to zero. Small fruite are all good, except Black Currants, which were thinned by the apring gales. J. Fraser Smith, Cullon House Gardens.

- The fruit this season with us is good everywhere, bat Apples are almont a fallure. Peara and Pluma, although they afferea in the early part of the season by reason of drought, winds, and low temperature, are a good crop. William Alexander, Mountblairy House Gardons, Turriff.
Brbwichshirb.-Oar fruit cropare, on the whole, good. Trees healthy, owing probably to the scarcity of fruit last year. Bloom was very abundant, and
an a whole is a mall crop. Plums have undergone a severe thinning. Pears only on young treen are a fair crop. I have seen a heavier set of Apples, but these will nevertheles be a large and fine crop. . P P $_{\text {P }}$ Brotherston, Tyninghame, Prestonkirk.

East Lothian.-Pearsand Apricotare not a heavy crop, but Apples, Plums, and Cherries are abundant and good. Lord Saffield, Keswick Codlin, Warner's King, Stirling Cattle, Hawthornded, Blenheim Orange, Cox'a Orange, King of the Pippine, and Worcenter Pearmain are amongat the beat of the Applea. The amall fruite are an extra heavy crop, except Black Currants. All other sorta, eapecially Strawberries and Gooseberries, are plentiful. Wm. McKelvie, Broxmouth Park Gardons, Dunbar, N.B.

Fifasenare-The crop of fruit in this diatrict is extra heavy, and with recent rain the fruit will attain it normal aize. The Applea are enpecially heavy, with the exception of Cox' Orange and Blenheim Pippins on walls and standarda, and Ribaton Pippin is thin on wall treen. Denyer's Victoria Plam is extra good, and the Dammons are the heavient crop ever seen here-at leaat, within the

Fig. 29.-tohihatchewia isatidna: flowers bosi-lilac, and fragiant.
(sEN P. 150.)

We had little or no front, oniy apelis of annlest cold weather, which wonld account for much of the blossom not setting, and again the long drought later on had an equally bad effect, causing many of the fruits to drop off of uch reliable worts as Stirling Castle, Ecklinville, Pott's Seedling, Warner' King, \&c. We have an over-abandant crop of Apples, and the fruit is awelling fast. We never had auch fine crops of Gooneberries and Strawberries as this season, the rain just coming in the nick of time to mave the crop. John Cairns, The Hirsel Gardens, Coldstream, N.B.

- The fruit crope are in general, in this distriet, very good, although alightly thinned by $6^{\circ}$ of frout on June 13. Cherries have been the heavient crop I have had in five yeara. Gooseberrien are mimply an enormous crop, many of the busher lying quite fat on the ground under their heavy load, and all of aplendid quality. I attribute the heavy crop of emall fraits to be greatly due to the abuence of bullinaches in apring, asually they do great havoc amongat the buds. It is premature to way more about the large froits than that they promise well at the prempnt date. J. Ironside, Blackadder Howse Gardens, Edrom.

East Lothian.-Nmall fruite of all kinde are this year an overflowing crop, and notwithtanding the drought. are large and of good quality. Some Apricota are well wet, othert almont bare, and the resnlt
lant twenty-three years. Gage Pluma are acarce, although they encaped ivjury by apring frost. W. Williamson, Tarvit Gardens, Cupar.

Fifestire.-Fruit irees of all sortm flowered most profusely, but owing to the very dry weather and $4^{\circ}$ of frowt on the mornings of June 13 and 14, Pearm and Cherries auffered badly, and dropped a great many of their fruit. Gooseberrien, Currants, red and black, Raupberries. \&c., are a very heavy crop. Strawberrie the same, of extra fine quality, and nineteen day earlier than 1894. John Clark, Wemyss Castle Gardens.

Forfarshurn.-The fruit crop is generally a fair one, Plum trees that were heavily cropped lant season are thin in mont cases. Gooseberry bushes are not much infented with red-spider, which was so bad two years ago; indeed, all frnit trees and bushes are more free from insects and healthier-looking than uaual. Strawberries are a good crop, the rain juat came in time to aave the crop, which was ready ten days earlier than last season. John Ruskin and British Queen. with Garibaldi, arr our best this messon. W. Me Dowall, Brechin Castle Gardens.

- On the whole, the frait crop is abundant, and of good quality; Strawberries enpecially are very abundant. Raspberry canea were damaged by the severe frost in February, the crop is consequently scarce, but of good quality. Goomsbarries in the early part of anmmer were infeated with red] epider
and caterpillar. Apple and Pear trees are looking clean and bealthy, and are carrying fair cropt of fine fruit. Plams, expecially on walle, are fine. Thos. Wilson, Glamis Castle Gardens, Glamis.

Midothlan,-The frait crop in, on the whole, the finent we have had for many yeara. Apple are fully an average crop, and promise to be much finer in nize and quality than usaal. Pears, Plum and Cherrien are bearing heavy crops of firat-rate quality. Apricota, Peachen, and Nectarines are plentiful here, although acarce on open walls in same places in the district. Small fruits of all kind are very abundent, particularly Gooneberries and Strawberries. The long and evere winter did no injary to the fruit trees, owing probably to the remarkable dryness of the atmonphere and absence of wind all through the storm. The apring was late, and very favourable for the fruit, which et thickly in April and May, and awelled freely with the raina, which came just in time in June to save the Strawberry crop. Trees have made a fine healthy growth, and so far have been very clean and free from insect attack. M. Dunn, Dakkeith Gardens.

- For monthe the fruit crops in thim district have anffered from drought, and although growth was almost at a atandatill, yet the fruit held on till the welcome rains came. I am glad to report that Applen and Pearn, and all kinde of mall fraite are now awelling and ripening an abundant crop of good quality. M. Chapman, Eastor Duddingston Lodge Gardens, Portobello.
Roxborghstirb.-Owing to having had $6^{\circ}$ of froat on Jane 13, the fruit propect here were conaiderably altered. Applea, Peara, and Plams net very well, but the fruit of Plums and Pears fell off a good deal, and the Apfle cropis falling a good deal at this date (Jaly) ; atill, on some tree there will be a good crop. Strawberrie a very heavy crop and good (I had gathered 92 pints one day, and 113 pints another day). Raapberries good and clean.' Biack Currante good; I was able to gather 120 pinta from the bushee, whereas lant year I didn't get a pint, owing to the week's frost in May. Dameons are a very heavy crop. Cherry trees have been very clean of blackfly all the season, and all other kinds of fruit trees are clean and healthy. John Page, Monteviot Gardens, Jedburgh.

## 6. SCOTLAND, W.

Ayrsenes.-The frait crop in this district promised, in the early apring, to be very abandant, Trees and bushen were very clean and healthy, and covered with blossom, and fruite of all kind wet thickly; but they received a severe check in conecquence of the long aevere drought. Since the showery woather set in, all fruit treen have greatly benefited, the trees are getting clean and healthy-looking again, and the fruite swelling faut. 4. Wilson, Auchincruive Gardeme, Ayr.

- On the whole the out-door fruit crops are better than they have been for years. Plums enpecially are exceptionally goon, and during my over forty yearn' experience I have never aeen a crop to equal the one I bave thil year. Richard Kitchin, Goodham, Kilnarnock.

Lanarkshirs.-I have been six years here, and have not previously seen such a heavy crop of swall frait, eapecially of Strawberries, an is the case here and in mont parts of the county. Cherrie are very little grown hereabouts; and Peaches, Nectarinea, and Apricots are only grown oat-of-doors in very faroured localition and under special care and man* agement, at the district mffer mach from late apring frosts. William Castle, Blantyre Lodge Gardens, Blantyre.

Abeylhemure.-The outdoor fruit crop in the gardena here are over average. Strawberries were an abundant crop, large and good. We commenced gathering Keen's Seedling on Jane 22. Plam on wall net so thickly that quite two-thirde had to be taken off. Pears on walls carry an average crop: Louise Bonue of Jerser, Madame Treyve, Beuryé d'A manlia, B, d'Aremberg, and General Todtleben are heavily
laden. Apples on pyramids have good crope of fine frait, and on bushes over average. Cherries aweet, and Morellos are laden; also Gooseberries, Raspberries, Brambles, red and white Carrants, but blsck Carrants are almost failare. Peaches, Nectarines, and Apricote, are not grown out-ofdoorn. D. S. Melville, Poltalloch Gardens, Lochgilphead.
Stiplingeritre.-Apple and Plam trees were never more eeverely attacked with graba than this jear, but these were got under by liberal applicatione of insecticides. The young growth is now vigorous and healthy, and most of the trees are well cropped. Small fraitbushes are heavily laden with froit, and have all along been vigorous and healthy; no insects have been seen on them. The frait is unasually larke, which we attribute to liberal manuring. M. Temple, Carron House Gdedens. Falkirk.
Wietonsmirs.-Apples, Pears, Plames, and Cherrien are all good cropn, the trees healthy, and almoat free from insect penta. Apricots and Figs are below the average; the latter auffered from the effecte of the eevere frost, which killed mach of the fraiting wood. Gooseberries are heavy cropa, but the trees are badly infested with caterpillars. Carranta and Raapberries are good cropa, and the frait very fine. Strawberrie were abundant, but owing to tha hot weather were soon over, James Day, Galloway House Gardens, Garliestown.
(To be contisuad.)

## American Notes.

ORCHIDS AT TRENTON, N.J.

## (From Our Oron Correspondent.)

One of the most intereating collections of Orchids at prenent in this country is that of C. G. Roebling, Esq, of Trenton, N.J. It bide fair to excel the ponition which it has already attained, and preparations are being made for extensive additions; four new glashouses are being erected, all of which will be devoted to Orchids. Cypripediame, both species and hybride, form no inconaiderable portion of the whole, but perhaps the chief feature is the large collection of white Cattleyas, to the collection of which Mr. Roebling han directed his fall energies, and it is his desire to make his collection of the white Cattleyas as perfect as possible; with such an enthasiatic owner the time cannot be far distant when the Trenton collection will contain specimens of all the known "Albino" forms. It will no doubt be of interest to many to see the list of thowe already incladed.
Cattleya Triarei alba, forty-five bulbs, ten leade, and grand variety; C. Gaskelliana alba, twenty bulbs, five leads, fifteen splendid blossoms; C. G. alba Trentonensin, very deep orange throat, six bulbs, two leads; C. Skinneri alba, ten bulb, three leads; C. Monniz alba, twenty bulba, three leads ; C. M. alba Trentonensis, eight bulbe, two leada, a grand variety; C. Aclandize alba, ten bulbe, one lead; C. Chocoenais alba, two planta, three leads each; C. Percivalliana albs, nix bulbe, one lead; C. amethyenogloses alba. seven bulba, one lead; C. Loddigenii albs, seven bulb, two leads ; C. Bluntii, tive bulbs, one lead, part of original ; C. intermedia alba, aix balbs, two leade; C. Schrodera alba, four plants, four leadz to bent one; C. S. alba Trentonenais, grand variety, ten bulbe, three leads; C. Eidorado alba, ten balbo, four leads.
Very marked advances on sll other white varieties are C. Gaskelliana alba Trentonenaie, C. Moneme alba Trentonensis, and C. Schroderxalba Trentonenais.
The C. Gaskelliana has extremely rich orange in place of lemon in the throat; the C . Mosais hasa nearly green throat; the C. Schroderp has almont an entire orange lip, anve a amall white margin. They are three noble white forme, and are probably anique plants, superb in thape, and exquisitely pure, well qualified to bear the neme of the home of thir aplendid collection of white Cattleyar.

The white Lueline include L. purpurate var., parent white, except a few faint lines in the throat,
two plants ; L. majalis alba, sixty balbs, nine leade, true: a splendid healthy apecimen; L. ancepe alba, Ball's original variety, two fine plants, three and four leads; L. antumnalis alba, twelve balbs, four leads.
The climate of the district seems to be admirably adapted for the growth of Cattleyas. C. Rex here growe with an astonishing vigour, and in a ahort time there will be a wealth of blossom; nothing could be finer. One apecimen has fifteen flower: from three growthn, and the new bulbs and leaves are as large as thowe of the bent grown Lalia purpurata.
C. gigas is represented by some fifty magnificent pieces, all in flower; one piece carrying twentyeight, and had had more. Among the more diatinct species of this variety is one named Lageri in honour of ita discoverer, who introduced it and many other excellent forma, through Messrs. Pitcher \& Manda. The lip in this variety in very brond, and of the most intensely deep parple-crimson; the remaining portion of the lip in very finely veined, and has no trace whatever of the characteristic yellow spote. The repals and petala are also exceedingly rich; a plant of C. gigas Sanderiana was noticeable for the fine expanse of ita lip. Also in flower was a new Cattleya hybrid, which is named Juno by requent of Mr. Roebling; it is deacribed elsowhere (nee p. 118, Gardeners' Chronicle, Auguat 3).
C. Hardyana, a aplendid apecimen with four leads, attracte by its gracefol form and delicate colouring. Of hybrid Lxelio-Cattleyas the one out of L. purparata and C. Moniz known an L..C. Canhamiana in very attractive. The finely frilled lip and the drooping potais having the pecaliar twist of L. parpurata give it an air of diatinction.
Lxlia tenebrosa Roeblingiana was past ita beat, but it atill atood a worthy reminder of what had been. Its colour, dark rone madder, sepala and petals with an almost black-purple lip, maken it quite free from anything else.
Cypripediums embrace such a host of forms (over 250 , all select too) that it in not ponsible to enumerate the whole ; only a selection can be given. Clone attention is given the hybridizing in this collection, and hoste of young seedlinge are to be seen everywhere, the work in hybridizing being largely carried on as checks on the operations of other hybridista. It is thought, and wisely too, that it is better to reproduce an acknowledged fine hybrid than to wander off into a multiplication of "noveltien" of mediocre rank. However, at the ame time work in being done along original lines, not only in this genas, but in Cattleyas, Lelise, Epidendrums, \&c., and thriving under the akilfal care given them by Mr. Henry T. Clinkaberry, who was formerly well known to English orchidista, nome highly interesting resulte may be expected. One of the most conspicuous of the Cypripedes is C. Gowerianum, with its doraal sepal $2 \frac{1}{2}$ inches acrose, and finely apotted. Others are, to take them as they come, C. Rothachildianum, with foar flowera ; C. macropterum (Lowii $\times$ Veitchii), very elegant, with ita clear rone-coloured sepals; C. Sanderianum, having had four flowern, the piece with six new growtha; C. Smithil (Lamrenceanum $\times$ ciliolare), very rich in colour, well-balanced flower, with ita pretty flat dortal repal; C. Chamberlainianum, in fine vigour; C. Cartivii; C. candatum Wallacei (the albino form of the apecies) bad five flowert; C . Brownii- glorifed leachorhodum-and a whole hout of others. Other noticeable apecies are Coelogyne pandurats with foarteen lead, C. Dayana in fall flower; Dendrobium Farmeri, Lelia Arnoldiana, with four flowers ; Braseavola acaalis, EpiCattleya guatemalensis, with fourteen atrong growths; Dendrobium Falconeri giganteum, with ita showy flower larger than that of the largent nobile; Epidendrum Watsoni, not often to be seen in these collections, becanse not sufficiently ahowr; and Epidendram O'Brieni $x$, which had been in flower for the last eight month, and atill blooming profanely! That in the num of the most noticeabie forms at present in the collection. White Lalias, however, are a featare in their aeason, and mast be seen later.
Odontoglonume are growe to a limited extent, but it is antraggle against the climate, which is too bot
to to modify the conditions-sinking the houne, patting them on the north vide of the wall, \&c., with the result that in this particalar case there are fair signs of uccess. The anme may be said concerning Miltonias, but the very circamstances which are detrimental to these groups give to the Cattleju, \&c., atrength and vigour, which it is a rare treas to eee.
The rapidity with which Cattleya and Lselin need. lings germinate here is very noticeable. Plantas art plainly visible to the naked eye five and six week after sowing the seed; and, indeed, numbera haro been put into tiny basketa six months from sowing. None but the finent varieties are being used in then crosees, of which over fifty have been nown alrends. Leonard Barron.

## LELIA DIGBYANA.

Knows from the time of its introduction from Honduras in 1846 aa Brasaavola Digbyana, Lindley, 4 name which it etill bears in most gardens even at tho present day, despite the fact that its botaical features place it under Leslia and well aeparste it from the terete-leaved Brasaavolat, the plant hu always commanded a considerable amount of attertion whenever ite quaint fragrant greenisb-whits flowera have appeared. Of late year, additional interest has been taken in it on account of the opportunitien which it gave the hybridiat of producing novelties showy in appearance and atrikiang in form. The first of these, and one which has been one of the mont remarkable atrides made by the raisers of hybrid Orchidn, was the Lxlio-Cattleya $X$ Digbyana Monize ( G . 31, p. 161), raised by Meur. Jan. Veitch \& Son between Lexlia Digbyana $\delta$ and Cattleys Mosnix of, and firat flowered by them in May, 1889. The flowers are of a clear rove colour with a few crimson blotches on the lip, the tabe of which is yellow with white veining and nome reall purple dota at its base. In the beauty of ita fringed lip and the fragrance of ite noble flowers it closely follows Lxelia Digbyana, while in their colour and large aize they resemble Cattleya Monsix. It it certainly one of the beat of garden-raised Orchid, and it received a First-clase Certificate at the Roju Horticaltural Society on May 14, 1889.
The Laelia Digbyana of our illastration (fgg, 30, p. 153), wae flowered by Walter C. Walker, Kqqu Porcy Lodge, Winchmore Hill (gr., Mr. Geo. Cragk), and it received a tardy acknowledgment of ith merits at the hands of the Orchid Committee at the laat meeting of the Royal Horticaltaral Socives, when it received a Firat-clam Certificato.

## CHINA ASTERS.

The China Aatere are amongat the beat of all the annual garden flowers. They are of the emied culture, moat free of bloom, and comprise a multitude of forms and colours. They are therefort admirably adapted to profuse and generoas effect il achemes of planting.
The evolation of the China Aater auggesta that of the Caryannthemum at almost every point, and it in therefore, a history of remarkable variations. Tho plant is native to China. It was introdnced into Earopo about 1731 by R. P. d'Incarville, a Jeenil minsionary in China, for [in honour of] whom the geall Incarvillea of the Bignonia family was named. At that time it was a single flower; that in, the raps or light. late florets were of only two to four rows. Them raya were biae, violet, or white. The centre of the flower (or hend) was comprised of very numeroul tabular yellowish florets. Philip Miller, the anmoul gardener-botaniat of Cheleea, England, received seeds of the single white and red Asters in 1793, evidently from France; and he received the ainglo blue in 1736. In 1752 he obtained seeds of th doable red and blae, and in 1753 of the dould white. At that time there appear to have beell 10 dwart forme, for Miller saye that the plante gref 18 inches to 2 feet high. Martyn, in 1807, in that in addition to these varioties meationed
Miller, there had then appeared a "varieguted bion
and white " variety. The epecier wat well known to American gardeners at the opening of this century. In 1806, M'Mahon, of Philadelphia, mentioned the "China Anter (in sorts)" an one of the denirable gardenfannual. Bridgeman, a New York seedsman, offered the Chisa and German Aaters in 1837 "in numerous and splendid varieties," specifying varie-
central florete of the head, and the production of the "quilled" flower. This type of Aster wea very popular forty and fifty year ago. Breck, in the first edition of his Flower Garden, in 1851, speakn of the great improvement of the Aster "within a few yeare," "by the German floriats and others," and add that "the full-quilled varieties are the most
later days, and the many flat-rayed, loose, and fluffy races are now mont in demand, and their popularity is unally greater the mearer they approach the form of the ancombed Chrymathemume.
The Chida Aater bad long aince varied into a wide range of colour of the cyanic serien-shades of blae, red, pink, and purple. I do not know

tien "alba, rubra, coerulea, atriata purpurea, \&c." In 1845 , Eley said that "China and German Aotern" "are very numerous" in Now England.
This name German Aster records the fact that the firat great advances in the evolution of the plant were made in Germany, and the seed which we now use comen largely from that countiry. The fisut marked departure from the type appeara to have teen the prolongation or great development of the
highly eatecmed, having a hemiapherical shape, either it pare white, clesr blue, purple, rose, or deep red; or beautifully mottled, striped, or edged with those coloars, or having a red or blue centre." About fifty years ago the habit of the plant had begun to vary conniderably, and the progenitorn of our modern dwarf races began to attract attention. The quilled, high-centred flower of a generation or more ago if too atiff to satisfy the tastes of these
what ite origisal colour might have been. The modern evolation of the plant in in the direction of habit, and form of llower. Some type varien-gencrally rather audenly and without spparent cant into some novel form, still retaining ite accuatomed colonr. The fiorist fixes the variation by breeding from the beat and most atable plants, and socu other colours appear, until he finally obtain the entire range of colour in the apecifs. So it happen
that there are varion well marked races or types, each of which has its full and independent range of colourr. The Comet type, now the most deserving of the China Asters, illastrates these atatements admirably. The Comet form-the loose open flower with long atrap-like rays-appeared apon the market about 1886 or 1887 , with a flower of a dull white overlaid with pink. The pink tended to fade out after the flower opened, leaving the colour an nawached white. The rose coloured Comet next appeared, and the blue was introduced in 1890. The first clear white was introduced in America in 1892, coming from Vilmorin, of Paris, and the China Aster bad reached its greateat artistic perfection.
The greatest denideratam pet to be attained in the China Aater is a pore yellow flower. There meema to be come general incompatibility between the cyanic and the xanthic, or yellow, series of colours. Yellow of a pare type bas not yet been attained in the annual Phlozes, and many other plants which affect the blues and reds. Yet the Chrysanthemum and various nther plants combine the two, and I confidently expect that the China"Avter will eventually do the same. We already have diatinct approaches to the yellow in the Lemon Gem, in which the flowers are suffased with a lemon-yellow tint, and in a yellow quilled variety introduced this year by Barpee an the Yellow Auter. This latter Atter is one of the crowned type, having a good yellow centre, and a border of whitish rays.
In the immense range of colour, forto, habit, and semon in the China Aster, the flower-lover can find almost any ideal which an snnual Composite flower can be expected to natisfy. In earliness there hat been a dietinct advance in recent yeare in the introduction of the excellent French variety, Reine des Halles, which is known in thic coantry as Qaeen of the Market. This variety blooms early in Angust at lhaca, even when the reed is sown out-of-doors. One of the earlient forme of this type of Aster is Barpee's Queen of Spring, which will bloom by the middle of July if started in a frame by the middle of April. This Reine des Halles type of Aster was introduced in 1885 or 1886 by Vilmorin, although it had long been knowa in the Paris markets, but the atock was controlled by a few perions. This variety alao has the freest and mont wide spreading habit of growth, and the ateme are solong that the variety is very uneful for cut flowert. The Candelabra Asters are very like the Qusen of the Market in habit, but are later.
In anch a range of type, it is imponible to recommend any one of them as atperior to all others. If one wants deep and glowing coloart, I ahould recommend the Truffaut Astern, variously known as Perfection and Prony-flowered, and this type has a mont beautiful pyramidal habit and a high-centred incurved comely flower. The abades of red are eapecially good in this type of Aater. Closely allied to this is the Sample atrain, which has the distinction of being the only well-marked type of American origin. This type originated with Jamer Semple, of Bellevue, Pennylvania, who, by continued aelection, has brought it tc a high degree of perfection The plant is a tall and robuet grower, reaching 21 and even 3 feet high, with long and atrong atems, and very large flowers (often $3 \frac{1}{2}$ inches acrow) with incarred and often twisted rays. Two colours of this fine Aster are now fixed, the pink introduced in 1892 as Mary Semple, and the white, known as Seraple White.
For mgaelf, howevar, I should give the Comet Anters the very firat place amongut all the various tribes. The habit is dwarf snd compact, although free. Bat the great merit lies in the flat, toft, aprending long rays, which give the flowers freedom and novelty of ontline and anbatance which cannot be found in any other Aater. I am particularly fond of the great white Comet, and of the delicate shades of azare-blue. I thould place the Truffant, Semple, snd Jewell strains of Atace the all of similar type-in the second place. The Jewell Anter, kuowa as Apple Blotsom, hat no superior amonget the delicate shades of blash or pink. For
the third place, I should hesitate between the Washington and Carysanthemam-flowered types. The Victorias are generally given a very high rank, and they are one of the most popalar strains in England, particularly for pot-cultare, but they have not behaved no well with me. They seem to be untrue and mixed in type, and lant year many of them gave Hat, open "even," or centres. Yet I should place the Victorias fourth or fifth in my list. Beyond these types, it would be difficult to single out one atrain as anperior to other for purposes of general caltivation. All of them have particular merits, The Qaeen of the Market is desirable for earliness, long atema, and graceful habit, and it is popalar with floriats. The Qailled Asters are now so far outnumbered by the flat-rayed section, that they may be almont claned with the carionities. They are always usefal for variety, and many permonadmire their prim form. One of the beat of these is the Victoria Needle, a variety which distinguished itself on our groand. last year by giving the latent blooms of any Aster. Tae Lilliput,-a alim.growing sort, with amall atiff-petalled flowern-is also one of the favourites of the Qxilled section. Rsading Bearty is also an excellent $Q$ uilled Aeter.
Another type of Qailled Aster is reprenented by the batton-headed German Qailled, with itn scant fringe of short rays. The best form of this is the Betteridge, an improved strain with large flowers.
Amongat the carioas Aster are the Crown or Cocardeau, with a rim of dark colour, and a centre of white or light shades, the Harlequin or particoloured, and the many miniature or tafted sorts, some of which grow only 3 or 4 inches high, and bear a close banch of mall dense flowera. The very dwarf types are atiff and bunchy, but they are often uned for borders, and the plants can be lifted on the approach of froat, and put in pots, where they will continue to hold their flowers for three or four week.
It is imponible to construct a antiofactory clanification of the China Aaters. It is no longer practicable to classify the varieties by colour. Neither is it feasible to clasafy them apon habit or stature of plant, for several of the beat marked types run into both tall and dwarf forms. Vilmorin, however, atill divides the varietien into two groupt, the pyramidal growers, and the non-pyramidal growern.* The most elaborate clansification is that proponed by Barron, from a study of extensive tests made at Chiswick, England. $\dagger$ Mr. Barron hat eeventeen sections, but they are not co-ordinate, and they are really little more than an enumeration of the varions sypen or clases. After considerable atudy of the varietien in the field and herbariam, I find the following scheme to be the mont servicesble for my parpose:-
I. Flat-rayed Astert, in which all, or at least more than five or tix rows of raye, are more or less prominently flat, and the florete open.
A. Incurred or ball-thaped Globe Auterv.
B. Spreading or reflexed.
II. Tubular or Quilled Asters, in which all, or all but the two or three outer rown, of florete have prominently tabalar corollas.
A. Inner floreta short, outer ones longer and flat. Represented by the German Qailled.
B. All the florets elongated and quilled.-Con. densed from an artiole by L. H. Bailey in the Bulletin of the Cornell University Agriculural
Experiment Station.

## Orehio Notes and gleanings.

## cattleya schilleriana dulcotensis.

 A meadripol, and diatinct form of Cattleya SchilJeriana is now in flower in the collection of W. Cobb Esq., Dalcote, Tanbridge Wells, The flowers arelarge, and bave sepals and petais of a rotetinte large, and have zepals and petals of a rose-tinted

[^10]brown, with darker purplish-brown spote, and ia these particulars it resembles other forms; bat the broad reniform front part of the lip is of a rieh crimson-purple, as clear and bright as that aually observed in C. Warscewiczii, and deatitute of tho whitish stripes or rays asually seen in the apecies, The only break in the colour of the lip is an almone imperceptible row of white dot inside of the fringed margin. The lip has a resemblance to that of $C$ Aclandix, bat it is of a darker colour. $J . O^{\prime} B_{1}$

## Bletia Shepberdi, Hooker.

Of the four apecies of Bletia recorded by Gritbach, this is probably the prettiest and at the moo time the one most suitable for tropical caltivation The Orchid is a parely terrestrial one, and thrives in the ordinary soil of the garden, and responda freely to the application of stable manare. In the fonl, section of the Royal Botanic Gardens we have a large bed containing some hundreds of this plant, which it now (April 18) in full flower.
It is probably a somewhat unique feature to sees bed of Orchids in bloom in the open sir, with orer a thousand well expanded fowera at one time. Tho fowers are, however, not developed at one seuon only, but are produced at intervale, though in mallir quantities, at several periods of the year, and the plant consequently serves as well for securing s sapply of cut flowers as for flower garden decore tion. Bulletin, Trinidad Botanic Garden.

## Cobyanthes leucocorys.

A few years ago the members of the genas Cory. anthes were thought to be difficult sabjecta andan cultivation, but latterly, however, they are to be wen thriving and flowering very satisfactorily in nome gardens, the improvements in the ventilation of Orchid-hoases in recent timen having probably romething to do with the success attending the cultirition of thene plants. Coryanthen lencocoryh, 3 Peruvian species, is one of the handmoment and richest coloured of the genan, the large white helmet above the rich rony-purple pouch of the lip being very remarkable. The yellowish sepale and petilu are tinted with parple, and curioualy folded. It her flowered with John Moore, Eaq., Chardwar, Boarton• on-the-Water, who rende it for identification, mid several apecimens of it have bloomed with Meum F. Sander \& Co., at St. Albanr. J. O'B.

## Cypriprdium Kimballianom.

A note under the above heading in the Ondili Reviect, August, p. 238, demande some notice.
It rans thas:-"A tine Cypripediam in figured ader the sbove name in a recent issue of the Gandewn Chronicle (June 29, pp. 800, 801, fig. 125), where the note appears that it is 'supposed to be a hybid between C. Rothachildianum and C. Dayanam nataral hybrid being intended. It will therefore be interenting to complate the history of the plats It is in reality C. prostane, Rebbo f. (Garlem Chronicle, 1886, iin, p. 776), a New Gainen ppeisw introduced by Measra. Linden. It was aftermarti figured in Lindenia(vi., t. 249) as variety Kimbsllianalif and altimately became C. Kimballianam, througd the omission of the specific name. When Cypripedien Rothechildianum was introdaced by Mearr, Sasdr it was recorded as a native of New Guines, Menre. Linden immediately atated that it will identical with C. Neoguineense, which ther wis previously introduced. A flower from e plant pive chased as one of the latter was afterwards nomizo to us, and was certainly C. prestang, as wha iso hatio of C. Kimballianum from another source. Is ha ad been re-dencribed as C. Gardineri, of Gaillemav, Nom confaned with C. glandalifornm, Blame, another thits Gainea epecies not in cultivation. The nert Nes - that C. Rothachildianum is not roo s lite Gainea at sll, but from Borneo. It is nor th to curione that a New Guines apecies should haves onth daty ae a natural hybrid between two Borneasi amed for but after the above confunion one is prepa to th almoat anything, and the leart we

## ttempt to put matters atraight."

The writer bee failed in his landable otifer and oaly encceeded in introducing further contwily
into a aubject emplicated enough, but previously having no besi $0 g$ on the present aubject, viz., Cypripediam $K^{\prime}, ~ b a l l i n n a m$. The fact is, the writer of the note hr "discovered a mare' nent," and seems to havr famped to conclutions and made erroneontsary ses and atatements.

There is, c sparatively, little resemblance between C. Kimballi am and C. prestans, and it is therefore not necesse to point out the differencer, but it may be anid th the leaven of C. prestans are generally obtase, $\mathrm{Gl}_{\text {jy }} \mathrm{y}$, and shining plain green, while those of C. Kimt hanum sre acute, thin, and pale green, with a dark sen reticalation, like those of some forms of C. Harrisiajam. In the flowers the colours are tr ly different, and in their atructure they have little \& common which would give the veriest not an excuse for mistaking the one for the ott The extraordinary large cushioned ataminode of prestans is a featare which places it away any other species: it twisted angularlyaded petals are totally unlike the flat downward red corresponding organs in C. Kimballianam,
1 in C. præitan the lower connate sepale are variably larger than the upper-a very peculiar ature, while in C. Kimballianum the lower are not inch more than half as large. James O'Brien. Fiowering spacimens of C. Kimballianam before as re very considerably different from thone of prestans -figared. Ed.]

## Cattleta $\times$ Hagdyana.

A great number of fine varieties of this âne Cattleya are grown in the gardens at Tring Park, three of the most remarkable of which are C. . $\times$ H. marmorata, whose petala are prettily marbled with crimson on fellow; C. $x$ Hardyana Lavervinenais, with petals of a rowe-purple colour, howing white patches between; and $\mathrm{C} . \times$ Hardyana, Tring Park variety, with sepals and petals wholly of a bright light tint of purple, the labellum in each case being of a dark velvetycrimaon colour, veined with yellow, and velvety in texture. Two other varieties are in flower there at the present time, the flowers of each being diatinct improvemente on the form ordinarily meen in gardent, sad they are fragrant. J. $O^{\prime} B$.

## Stanhopra Lowil varo Amrsiana.

This चariety, which proves to be one of the most beautiful, fragrant, and distinct of the new Stanhopeas, is now in flower in Major Joicey's gardens, Sunningdale Park, Berke. It is of the hornlems wection of Stanhopes, and ite large, glossy, ivory-white labellum, and membranous white sepals and petals, conatitute it a remarkably attractive flower. It was originally named S. Amesiana, but a comparison of the flower with that of S. Lowii, given in the Gardeners' Chronicle, December 2, 1893, p. 689, shown that it ia a white variety of that handsome species. It flowers at intervals throughout the summer, and ite flowers, which are fairly lasting, quickly eucceed each other. It requires to be grown in a banket like all the other Stanhopens. J. $O B$.

## hampton court house.

As may be inferred by the readers of this note, Hampton Court House is in close proximity to Cardinal Wolsay's famous Palace, and it is in fact only separated from it by Hampton Court Green, both places the resorts of thounands of visitors. Very fow, however, of the great crowd that visit Hampton Court have any idea that another beautiful garden is close at hand. Indeed, in the summer the place is hidden by trees, that only here and there can a glimpae of the fine old renidence be obtained. Hampton Court Hoase, with it garden: and pleasure-grounds of wome 9 acres in extent, is the property of Aug. de Wette, Eaq., C.C., J.P. The main entrance is in a direct line with the London Road from Kinguton-on-Thames, with the Hampton Court Green in its immediate front, and the wide expanae of Bazhey Park behind and around it, and although in the very midet of life and gaiety, the occapante enjoy the utmont seclusion and quiet.
Once within the boundary, the visitor will not be
long in recognising, firstly, that Mr. Do Wette is fond of gardening, and secondly, that special effurts are made to beautify the garden. It io by no means an every-day garden, with its aerien of flowerbed and bordern, filled year by year with plants of a atereotyped ordor; bat a garden rendered beautiful for the greater part of the year by grouping and massing a variety of plants with a view to effect; with this object, it is not surprising to meet with Rhododendrons in great numbers, also Roses, particularly the Ten varieties and hybrid from them. Azalea mollis, again, is an especial favourite here, great care boing taken to select colours that will harmonise with those already planted. This is accomplithed by periodical visits to nurseries in Which Azaleay form a leading featare when the plante are in flower. This method is very generally followed when making melections of Azaleas and Rhododendrons. When a new bed is formed for them, the wil hal careful preparation, and it is taken out to a good depth, a proceeding which account for the exceptional vigour and freedom of growth of the plante. Large banke of Rhododendrona form a very conspicuous feature, to say nothing of the many fine atandards also to be aeen elvewhere. For the most part the Azaleas occapy the lower parts of the undulating lawa, receiving shade from mome distant Elm, and thus protected from direct annshine, they last long in flower, and are seen to great advantage. Another charming feature is the Italian garden, ia which there are a variety of subjecta, moetly parmanent in character. Being nemicircular in outliae, and upon ground somewhat raised above the general level, view are obtaioable. In a central posicion is a life-size statue called Dow, represented in the act of poaring dew on the verdure beneath. This garden is encompassed by a Yow hedge, with grassy steps here and there as approaches to the lawn. A low hedge of Capressue Lawsoniana aures conatitute an inner circle, with handsome green vases at interval filled with Hydrangeas in full flower, and immediately inside this is a narrow border, the chief occupants of which are Retinospora squarrona, Equonjmus radicans variegata, and green-leaved Box.
A series of beds in the centre on the lawn are filled with Captain Caristy Rose, and othorn with Marie Baumana. Tae plante of the firat-named are less than 2 feet high, very clean and vigorous, and teeming with buds and blooms. On sither side of the grasey atep above noted, and in other equally suitable positions in this garden, may be seen some noble examples of Golden Junipers. Every one of these is a handsome specimen, about 10 feet high, well matched and furnished with branches and foliage, and well coloured. As an oater circle to the Italian garden, and approached from it, is the Rose garden proper, which containa a choice assortment of Roses, of which hybrid Teas and Teas predominate. One variety may be aingled out as a noteworthy inetance of a Rove for a very dry aeason on a light moil, viz., Hon. Edith Giffurd. It is regarded by Mr. W. Neave, the gardener bere, at the finest Rose of the eason. Qaite small plants of it were loaded with buds and blossoms, the latter opening perfectly. Festooning throughout this garden is Clematis montana, which early in the year is smothered with it snow-white wreath of atarry flowerm. It is sarprising this beautifal climber is not put to more extensive ase in gartions, it tlowers so freely, seeming to do best when left alone, or nearly so. For ascending and covering such thinge as Wellingtonian that have become disfigured, it hat acarce any equal. In the centre of this Rose garden in a recess, from which the golden figure in the Italian garden previoualy alladed to may be viewed. Among the decoration here are some Acer Negundo variegatum standards, with Clematis Jackmanni rambling in the branches. In another part of the garden this species of Acer is used to form an arch over some circular bede of the bedding Pelargonium, Heari Jacoby.
The glass department conoists of the usual forcinghouses, stoves, and plant-houses, in which a general asortment of the useful plants for tablo decoration
and cat flowers are grown. Among those grown for cutting are Carations, represented by many hundreds of plante, both border and tree varietiee. Indeed, Caraation are among the chiof favourites of both Mr. and Mra. D, Wette, and apart from quantities of the leadiag varietie of commerce, are to be found number of varieties which have originated ia these gardens. Quatities of meedinge are raised yearly, with the result that atrain of considerable merit it now eatablished. Many bede are set apart for Cerastion: appearance favoured a good display this sereon.
At the time of $m$ ' visit, early in June, one house, coataining about 600 plants of Gloxinia, made a beautifal diaplay. Particalarly noteworthy were the selft, which can sarcely be equalled for size or solidity of bloom. Some maseive whites, rich crimmon-maroon, and crimon-lake selfs, were quite remukable in their way. The shades of blues and mave with the distincive dottinge and markings were very carious. Elegan compacta has flowers of a rich crimson-acarlet plath, with mottled tabo; this is very free, carrying quite forty fally-expanded blossoms-most of the varieties were raised in the garden. Among the Orchid grown here are Cattleyan, Cypripediams, Dendrobes, Oncidiams, and others; Oncidium Lanceanam being found a very useful flower for button-bolen and the like.

Oatnide is a large and well-filled kitchen garden, every inch of space being occapied to meet the demand. Here and there among the trained Apple tree in the kitchen garden, the Misleto, very abandant in the Limen in the adjoining Bashey Parls, fiads a congenial home, and quite near to the ground. Quite a large border, between 200 and 300 feet long, it devoted to the bolder kinde of berbaceous plants; noteworthy among these being some fiae, well-ettablished clumps of Pxonies in variety, Delphiniums, $O$ ieatal Poppien, Eryagiums, Pgrethrum uliginosum, ad auch like. Beds are also devoted to some of the earlier \&lowering Gladiolus, Blashing Bride, Prince Albert, and Colvillei.
Not the least fine featare of these gardena is the conservatory, sae baildiag of considerable size, atteched to the manaion. Some the apecimen Palme are to be seen here, notably Areca sapida, fally 20 feet high, and in splendid plamage; Areca Bareri, come 30 foet high. Tase, with many othert, together with some artificial rockwork, now beautifally covered with a variety of anbjects, trailing and othorwise, all play their part in gracing thit handsome bailding.

A garden like that at Hampton Court House, coataining, as it does, to mach that is beautiful and intersating, is rarely met with. It is obviously the outcome of much carefal study on the part of it owner, ably aseisted by his gardener; and from one end to the other the gardens are a pattern of good order and neatneas, while the many instances of high-clase cultare that prevail tentify to the ability of Mr. Neave. E. Jenkins.

## THE SEED CROPS IN THE Eastern midlands.

A visir to the seed-growing districts of Lincolnshire shows that taking one part of the country with another and atriking a balance, the seed Pea crops promise to be better than in other parte of the country; the effect of the drought not having been so weverely felt, as welcome showers fell in May and June and during the early part of July. In the more woutherly parts the drought wat more severely felt, and the cropes are in consequence len promising. It is early yet to make anything like an approximate forecast.
Beams. - In the weed-growing districta round Bonton a full average crop of Broad Beans in expected ; at the time of our visit the pods were filling well, the ttalks green and healthy, with little appearance of the amother-fly. The Harlington Windeor Bean in the variety most growa about here, and enpecially for market, the white variets being preferred to the green. French Beant are a somewhat limited crop.
and Suarlet Raaners ales, bat what are baing grown look well. Caltivation for sead is more general in the coanties of $B$ :dfordshire, $\mathrm{K} \neq \mathrm{a}^{+}$, and Earez.
Cabbage.-As a market Vegetable, Cabbages are largely grown in the Buton and Spalding diatricta. The planto were injused daring the winter, and there wan at one time a lack of nasble green stuff. Spring Cabbagea were cat for market earlier than usual, and it being nanal to sow large breadtha of Rape in the antama for sheep feed, the farmers took advantage of the dearth of vegetables, and when the Rape was in full leaf, the leaves were cat and sent to market, finding a ready alle. Plantations for seed appear only in amall breadth, but they are healthy, though a good deal of the seed plant was injured by the frost; what remains is expected to yield well. The two leading varietien of Cabbage grown in the Eastern Midands are the Early Rsisham and the Offerham. Boaton in famoue for the high qualitr of the stocks of each.
Swede and Turnip;crops for need were also mach damagad, and a large acreage destroyed. It was late in the season when the plants commenced to grow ; numbers were aickly, and made no progress when the flowering time came. Swedes were found to be mach cankered, and the bloom was damaged by the high wind which prevailed in April and May; at one time it appeared probable that a very emall quantity of seed would be naved. The rains which fell early in Jane, however, were instrumental in freeing the planta of a good deal of insect life, and those plants which made a later growth promise now a fair yield of seed. Sach samples of seeds already gathered duly winnowed, which we nsw, were of an uneven character.
Mustard.-Nos very many breadthe of brown and white Mastard were aown, owing to the low prices prevailing for seed, the farmers fearing they may produce an unremanerative crop, and so add to their difficulties.
Potatos.-The early varieties are very extensively planted in the Eastern Midlande, and up to moaldingup time the planta made a strong and even growth. Dry weather following proved prejudicial to the production of ample crops, thoagh samples have proved fairly good, and prices are ruling nomewhat high. The sorts chiefly grown for market are Myatt's Ashleaf, Esily Paritan, Dake of Albany, Beanty of Hebron, and Snowdrop. Myatt's Aahleaf farnishes the firat crop, growers depending entirely apon this for an early eapply, and enormona quantities are sent to all parts of the country from Boston and adjacent atatione.
Peus for Market are largely grown in the fine loams found in the Eastern Midlands. For earliest crops the principal varietien are Earliest of All, Blue Alaska, and Harrison's Eclipue-practically three names for the same variety; and these are being replaced by early wrinkled forms of the William Harat type. To follow, come Telegraph, Improved Prizstaker, Harrivon's Glory, and Prince of Walen, all dwarf in growth, as the fertile loam causen a vigorons growth of haulm; but the cropn are heavy. These are the main crop sorts ; for later cropt, Veitch's Perfection and Yorkshire Gem are grown. The attention of growers is being turned to the Early Wrinkled Marrowe in courne of diatribution by Mesers. Satton \& Sons, of Reading. and it is expected some of the older sorte will be diaplaced by these improved typer. Pisum.

## BOTANICAL GARDENS, EDGbaston, birminghan.

Thess gardent, to delightfully andulating, and so rich in treee and shrabs, well repay a visit at the present time. Since the welcome rains came, everything has brightened up wonderfully-freshneese and beanty are on every hand, and the order obuerved everywhere in admirable, and reflecta credit on Mr. W. G. Latham, the Carator. On the terrace the flower beds are becoming gay, while on the sloping bank the bede are not only elaborately planted, but they are effective with varying tints of foliage and
flower. In the herbaceous departent
a wealth of bicon, and the Hagh Nettlefetd alpine garden is fas: becoming farnished. A more delightíal lounge can bardly be met with no near that great indastrial centre-Birmingham.
The thow-house is gay with Fachsias, which Mr. Latham employs with great effoct. Some of Mr. Latham emplary striking, anch as corymbifiora, now in fall bloom ; falgene, triphylla, \&c.; and of the decorative varietief, $R$ ne of Castille Improved, Lye's Casrming ; Albion, a fine dark; Dro Sankey. very diatinct; and a few others are laden with bloom. Taere is a very fine example of Crinum Macowani in fall bloom; overhead Lapageriae rosea and alba are in fall bloom, and the hage doublewhite Camellis, as well as the species reticulata, are seen to be well set with bads.
In one of the greenhoases $S$ ismaphyllam ciliatam -the golden Viae of Brazil, is tlowering abuodantly on the roof; \& very showy climber seldom neen. Francos ramosa is represented by fine planta, the white flowers thickly set on branched inforescences ; F. sonchifolia has an anbranched spike of pink flowera, with a darker blotch near the base, the petala not quite so brosd as those of F. ramona. Strobilanthes Dyerianas deserves to be noticed as a very handsome-folisged plant, its purple leaves glisten with a bright metallic luatre. Crossandra undalæ. folia in a plant seldom seen, ita reddith-orange flowers produced in spikes, and both diatinct and attractive. A very curions plant is Ceropegia Sandersoni, from Natal, the flowers pale green, mottled and veined with darker green, with a peculiar tranglacid appearance, the five potals uniting to form an umbrella-like cap, which is ciliated along the margin with flat capillary procenses. It is a vigorous-growing greenhoase climber, renembling an Allamanda. What in grown here as Alonooa acatifolia, probably a form of incisifolia, is a somewhat dwarfgrowing and free-flowering greenhouse thrub, with bright acarlet flowers, having dark centres. There is a collection of Gloxinias that show fine quality, and taberous-rooted Begonias, of which there is a large collection, are superb and very attractive. Pansiflora Raddeana (kermenina) is flowering freely on the roof; Impatiens Hookeri is blooming finely on the atage, and plante of Fuchaia triphylla exceedingly gay.
In the stove-house, Odoatadenis speciona is atill flowering; ite bright yellow, orange-bhaded, Dipla-denia-like blonsoms, are very showy; Gloriona nuperba is very atriking on the roof; and a hage blossom on a plant of Aristolochia gigas had a great intereat for visitort. Phalænopais Eameralda, from Siam, had two spikes of flowern, though the plant is amall; and the foliage of Acalypha tricolor is bold and richly coloured.
In the aquatic-house the Nymphæas are flowering freely, and in all departmente the most painataking culture can be noted. At all measons of the jear, a pleasurable vinit can be made to the Birmingham Botanical Gardens. R.D.

## The Week's Work.

THE ORCHID HOUsEs.
By W. H. Weirre, Orchid Grower, Burford, Dorhing.
DENDROBIUMB.-Tue deciduoue Dendrobiums muat be frequently looked over, at many of them are completing this season's growth, and have reached the atage when posiibly they may start afresh; it is therefore adviable to go carefully over the planta, selecting those that have finished making their growtho, and have the terminal leaf at the extremity of the bulbe expanded, to be placed on one side of the houes where more light and air can be admitted, and leas moistare given them. They should aloo be gradually exposed to fall sunshine, and until the leaves commence to tarn yellow the planta should not be allowed to remain dry for long togetber. So soon as the plants have become ased to the extra sunlight, and the new balba are fally developed, they ahould be removed to a cooler and drier atmosphere. They are perfectly afo if put in a vinery or any other airy structare where at the present reason the night temperatare is about $55^{\circ}$ to $60^{\circ}$. When fally exposed to the man'eraye, carefal jadgment should be
exercised in watering the plantr, as the sphagnummoss on the surface appears to be quite dry, when noderneath it is not so, and if the roots are tha kept in a conatantly astarated condition they will decay. Examine the plante day by day, and immodiately any signs of the bulbs shrivelling are detecied give them a thorough watering. Planta in emall pots or shallow pans which have become potbound should be taken down and dipped in a pail of water to easure a thorough moaking, but they mans receive no more until the whole compost has becoms dry.
thunias.-The Thuaias which are now falliy exposed to the san are frequently attacked by redexider and black thrips. Taese insecta mant be kept down, or thay will soon establish themselves amonget other plants, and, as aponging of the leares absorbs too much time, the best remedy is to lay the plants dowa on their aides over a tab or bath, and well ayringe the folispe with atrong nicotins: soap in the proportion of 3 or 4 cz . of soap to 1 gal. of warm soft water. Allow the plante to remain dowa for an hour, so that the insecticide may dry on the leaven. Aftermards the plants may be well ayringad with clear water, and pat back in their places.
habenariab.- Habenaria militaria, H. Sananner H. carnea and its pare white variety, nirona, aro now forming their bloom-apikes, and a shard lookout mast be kept to prevent thripe from disfiguring the budn. Nicotine-soap used at the rate of 20 oz, to the gal. of warm water is an excellent and asfo cleanaing mixtare. Every care should be taken that the solation be thoroughly washed off immediasely after dipping, and the plants protected from all sunshine for a few days.

CATtLEYAB, ETC.-Sach plante as Cattlega aurea, C. gigas, C. Rex, and C. Gabkelliana are not commencing to root freely from the newly-made growths. Now is the best time to repot or to surficedreas those that require it. When repotted the planta should be placed at the coolent end of the Cattleys or intermediate-house, where they mby obtain aufficient light and air to thoroughly harden their newly-made balbs. Very carefal watering is neceasary until the plante are re-entablibed, and only anficient ahoald be given to prevent the roota perishing. Leelia parparata, L. tenebrosa and L. cinnabarina are atarting to gron and may also be repotted now. The young breaki quickly send ont a number of new roots, which will readily enter the fresh compost. Keep these Ix:ius well up to the light in the Cattleya-house, and give them liberal treatment in every way until growth is completed. In the cooler part of this honse Vanda of the tricolor and suavis aection are now in fall growth, and a decidedly moist atmosphere should bo maintained arouad them, and the ventilators nereet to them may be opened whenever the external air it above $55^{\circ}$. They do not require to be atatartied with water at the root, only nufficient being necer ary to keep the sphagnum - mons freth and green. The rare Dandrobiam Falconeri giganeenu will grow well ander similar treatment, but a litithe extra sunlight is best for it. Rod-spider is ist greatent enemy, and maut be kept down at any coot. In the Odontoglonsum-house such species sit grande, $O$. Schlieperianum, $O$. Insleagyii and ith everal varieties are making growth, and shoold bo placed in the warment corner. If they are not already repotted, this should be done before the flower-spikes show.

## THE KITCHEN GARDEIV.

By Joier Lamarrt, Gardener. Powis Cante, Weashmol.
spinach. - Prepare a piece of good groand in which to sow Spinach for early winter and aleo opring oupply. The second or third week of Auguat mbit be quite soon enough for early warm districta, but I would recommend two sowing (at the least) eedt made at a week or so apart. The same datst oneo season will not always prove to bo the righand Where this dish in very much apprecisted, make three sowings. Choose, if possible, sp piece if aweet, well-drained, mollow ground. It will affed atagnant in the soil in winter, the frost win woll the crop greatly. The situation should bo koom exposed to sun, but not where frost to be extra severe. Sow in rows apart, and directly the plants are inch ground, thin them they become again take out every other one, leaving 3 inches apart. The thinnings may bo nued ferin table, and the en eowings should provide pleatind
picking during October, Nuvember, and all through the winter, if a mild season. S jot is a good manare for Spinach. Tae Improved Victoris broad-leaved is quite equal to the old prickly variety for standing the winter, and produces a much better leaf.

BROCCOLI-Ljok over bed previously planted and fill up any gaps that have arisen, dust the planta occavionally with soot or lime to keep vermin in check, and slightly earth ap any that require protecting from the wind. A batch of late varietie: may even yet be planted, and will prove of good service neat spring, if the plants are good when put out. A these are dwarf and of compact habit, do not be tempted to plant them much closer than the larger-growing varieties; plenty of room mut be given if they are to atand through a hard winter.

CARROT8.-If pita are not available for these, s nowing hould be made now outside. It will farnish small roots for drawing young, and if a mild winter ensues, they will also be of service in the spring, but they munt be sown in a warm sheltered position on good land free from wireworm.

GENERAL WORK. - Do not by any mean let weed ripen their seeds, but have them hoed ap the firat hot sunny day available. Such crope an Ranner Beans, if bearing heavily, should be afforded liquid manure occarionally. Oaions, Beetroot, young Cauliflower, Tarnipt, and almost all other root cropa bhould be given a dressing of soot when rain is expected. Make liberal sowings of Ocange Jelly and Chirk Castle Blackstone Tarnip for winter use The first wet day will affurd an opportanity to atring or tie in small bunche Garlic or Shallots. The Mahroom house too, mould be cleaned of all refuse and the walls be freahly washed with lime. Walks must be kept clean, and where box edging is used, this mant be done by hoeing or hand weeding.

## THE FLOWER GARDEN.

## By Baiciey WADDs, Gardener, Birdsall Gardens, York.

Lawns and pleasure grounds.- Since the recent heavy rains the turf on grass lawns has improved, and in places where it has been killed by the drought and brown patches are seen, a eprinkling of lawn grass aeed nhould be sown, and a nlight top-dresing of fine soil given with a small quantity of phosphate manuse mixed with it, sweeping the tarf well over after, and rolling it well. Newlysown grase lawne thould not be cat closely with the machine, bat if they are mown eeveral times over with the cythe the first season, the grass will bs better for it. Continue to mow weekly with the lawn-mower old lawn that require to be kept in good order. Where the grass has not been mown daring the dry weather it should be acythed over twice to take off the long bents of grase that the machine will not take. Tre present time is convenient to take out Plantain and other weeds and brashing soil into the hole made; keep grasn edgings well clipped. Gravel patha and carriage drive should be kept free from weeds, and the accumalation of ailt and rabbish about the openings of drains ahould be daily removed during atormy weather.

EMRUB BEDS AND BORDERS shoald be frequently hoed and raked until the falling of the leaves. Daring the next few weeks beds and borders of shrubs should be looked over and notes taken before the fall of the leaf in regard to the transplanting or pruning back of decidnona varietien that are growing too thickly. The autumn growth of Evergreen ehrubs should be encouraged, and all the light and air possible given them. Evergreen are often injured by Lilace and other quick-growing deciduous shrubs which shade them during the autamn months. The budding of doable-flowering Thorns and other deciduous plante may now be done Where the bark of the atock is in gool condition. Evergreen hedges of Privet or Yew should be cut into the required hape, and edginge of Box, Ivy, and other evergreens trimmed. Ivy edgings of bed: recently planted should have the shoots pegged down at they grow antil they have formed a good edging, and old edging: of Ivy thould be kept at free from weed, at posible. Care should be taken not to cut plants of Iry growing as edginge or on walle at this season with the garden-shears ; if the shoote require cutting a knife or pruning acissors should be aned. No large foliage evergreen shrub should have the leavee cat, at this time of tha year especially. Make mecure atrong shoote of Virginian C-eeperi and Clematis growing on walls.

PROPAGATING-Cattings of bedding Pelargo niums should be taken as soon as they can be obtained and struck in boxes out-of-doors in the full sua. Cottings of Verbenas, Coleas, Iresines, and Alternantheras will atrike freely in a closely-abajed pit or house, and if there is a little bottom-heat for them so mach the better. Cattinga should afterward be taken of Pentstemona, Antirrhiaums. doable - flowering Rockets, Ljchnis, Veronicas, \&c. These will atrike very well in a bed under a cold frame and in pote under hand-glasses if shaded from the sun and givea a light rich fine soil, with a good covering of sand.

BEED BOWING-Daring the present month seed should be sown of annuale required for planting in bode during the autumn or eariy apring months, such as Saponaria calabrica, Namophila insignia, Collinuia bicolor, C. grandifora, C. verns, Limnanthes Duaglamii, and varieties sulphures and odorata Silene pendula, Alyanm maritiman. Bartonia aurea. Candytaft, and Virginia Stocks. Brompton Stock: should also be sown on a sheltered border. Prick out Wallflowers as oon as they are ready, also Pangies, Violas, Anemones, and other seedling planta that are required for autumn planting.

## THE HARDY FRUIT GARDEN.

$\boldsymbol{B}_{y}$ W. Pope, Gardener, Bighclere Castle, Newbury.
HEAVILY CROPPED TREE8. - Fruit tree that may be carrying very heavy crops, or that have perfected their fruit and thow signs of weaknesy, will be greatly beneficed by a good coaking of liquid manare, or failing that, a top-dressing of fish manare, gaano, or other good atimalant, which may be applied to the aurface and well watered in. Timely attention to this matter will probably enaure a crop of fruit next season, other condition being favourable, on trees that without auch special assistance would require a season of reat to recover from the exbaustion consequent on heavy croppiag.

RABPBERRIE8.-As soon as fruit gathering in finished on Raspberry plantations the bearing wood should be cut clean axsy, and if more young canea are atill left than are needed for next year's fruiting, these should also be thinned by cutting out the weakeat. The remaining ahoots should be secured to the trellis or other support, so that they may be fally exposed to light and air, and be asfe from damage by high winds. Any loose manare left from the mulching may be raked off, and the surface-soil thoroughly loosened by hoeing. If the arface-soil be left rough, it will be conniderably aweetened. Should the canea be making only poor weak growth, they require to be ansisted by good wateringe of sewage or liquid-manare from the farmyard.
gathering early pears - Early Pearb, nuch as Jargonelle, William' Bon Cbrésien, \&ec., as they approach matarity, may be gathered a few at a time and laid on the shelves of cool frait-room for a few days until required for une. By growing these early sorts in different aspects, and gathering a few fruite daily as they approach the ripening atage, the early Pear meason may be greatly prolonged.

PLUM8.-Plame now ripening mut be afforded some protection againat birds, and as far at postible from wasps, which are this yfar much too plentifal. A fow trees of the choicest dessert kinds thould be covered with hexagon or other fine nesting, fatened closely at the sides at at entirely exclude wasps. Many may be trapped and destroyed by hanging widenecked bottles aboat the walls half filled with syrup. or a capital trap may be made with a couple of hand glanses, standing the lower glass on bricks, one at each corner, and putting a few half-rotten Apples or other fruit inside as a bait; the other glase mast be placed on the top, taking care to fit it nicely round the junction of the two glases. Make a small hole at the top of the underlight so that they may ascend into the trap, from which they are not likely to return. No effort should be spared, however, in searching for and deatroying every nest possible, a daring a fine warm autumn they increase at an astonishing rate.

## PLANTG UNDER GLABE.

By W. I. Axmrin, Gardever, West Dean Park, Chieherter.
IXORAB. -These plante will require plenty of water at the root, and a aprinkling of Clay's Fertiliser on the soil. Ixora plants in flower should be placed apart from others, the blooms being readily injared by the eyringing afforded the flowerlens vection. In the absence of ryringing, mealy-bug is aure to
increase, and in the case of the fowering epecimens, the use of a amall brush dipped in methylated apirits in it destruction is to be recommended. Toe patho and wall in house where Ixores are growing hould be kept nearly always in a mont stafe.

CALADIUM3.-Plant of these started early in apring will bave begua to how aigne of matarity by the dying down of the leaver, and a little less water should be afforded them. If they have become ahabby, place them beneath the atove-stagea where drip will not reach them. When quite dried off, carefally take the tabers out of the eoil and place them in boxes filled with dry and or coconnut fibre refuse, and store thene in a place of not leas warmth than $60^{\circ}$ for the winter.

CYCLAMENs. - Sow at this meason seed of Cgchamen, uiling ahallow well-drained seed-pan filled with a mixtare of loam, leafoil, peat ana and. Sow rather thinly, and not deeper than the frame, cover with a piece of glas, and keep them abaded till germination has begun. Cyclamen plants for flowering this winter onght now to be growing freely, and they will need to have water very carefully afforded, avoiding the extremes of too much dryness or the reverse. In bright weather the plants may be lightly ayringed three or four time a day. To keep the plants from getting one sided turn them round twice a week. It aphis or thrip appear on them, vaporise the house with XI. All.

MIONONETTE.-The main sowing for winter flowering may now be made, putting three or four seed in large 60\%. Place the pots in a cold frame till the seed are ap, when a partly shaded position outaide will suit the plants bent.
hUMEA ELEGANs.-As the young plants fill their pots with roote, continue to repot them, using good rich lonmy soil, potting firmly, and do not affurd water for a few days after re-potting. A cold frame is a auitable place for them antil they are reestablished, afterward placing them out-of-doort, and keeping them there till it is no longer asfe to

## FRUITS UNDER GLAB8.

By bighard Parien, Gardener, Goodvood, Chichester.
WINTER CUCUMBEAS. - If not alrendy done, no time thould be lost in cowing seeds of suitable varieties of winter-bearing Cucumbers. I prefer to raise the plants at this season in the plant-atove, where there is a brisk heat, and lesa fear of the young leavee being injured by red-spider. When Cacumber plante are raised in pits and houses contaiaing old Melon and Cucumber plants, there is alwaye a danger of this occurring. Sow the seede in thamb-pots, and place these on a shelf near the roof-glass as moon as the meeds germinate. In the meantime house shoald be prepared for their reception, so that they may be placed in thair winter quarter: at an early date, to become well eatablished before the autama commencer. The house abould be cleared of all the old soil, the woodwork acrubbed or painted, and the wall lime-wathed twice. A hot-bed should then be made up of well-prepared freah fermentiag mete-rial-leaves and atable-dang-and hillocke of new, light soil prepared for the plantr, which may be planted out when the heat of the bed has declined to $85^{\circ}$. After the plants have been pat out on the hillock they mat be encouraged to make atrong short-jointed shoots and leaven of firm texture, which can only be done by close attention to the ventilation, feeding, and sffording enough warmth. Safficient seed should alway be sown to enable the gardener to have a few plante in raserve in case of accidenta. For winter work I prefer the Cardiff Catle variety, amall-fruited kind that is more productive thas maay of the larger ones. Old plants should bs cleared out as they become exhausted, and the bouses thoroughly cleaned to receive other crops. Tai aleo applien to Melons and Tomatos, so as to allow of the houses beipg painted. Now also is a good time to have the heating apparatus examined, at the firea masy be diapenaed with if necenary for a few daym, to enable the workmen to make good all the bad joints. The work in the differeat departments at this senton conasta in freely ventilating all houses which have borne cropp, and protecting ripe frait from wasp and flex. I have found it necessary to place muslin over the ventilators, an wasp are very troublesome this year.

## EDITORIAL NOTICES.

## Advertisements should be aent to the PUBLISHER.

Llustrations.- The Editor will thankfully receive and selec photographs or drawings, suitable for reproduction in these pages, of gardens, or of remaricable plants, nowers, irces, de.; but he camnot be responsible for loss or injury.
Letters for Publication. - All communications intended for gublication, as well as specimens and plants for naming should be addressed to the Editor, 41, Wellington street, Covent Garden, London. Communicalions should be wRITTEN OY ONE SIDE ONLI OF THE PAPER sent os early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but the wris a guarantee of good faith. The Editor does not under kops us a guarantee of good jaith. The Edilot does not unden take to pay for any contributions, or to return unused com munications or illustrations, unless by special arrangement

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUGRD EROM THE OBSERVATIONS OF POETY-THRER YEANS, AT OHISWICK.-62.6.

The Phyllozera Certificate.

AT the meeting at Ghent convened to consider this question, M. l'Echevin Brunerl presided. He briefly summarised the state of affairs since the enaotment of the Berne Convention. The Italian Government has at length demanded the entire abrogation of the rules that have proved so futile and which have caused so much loss and inconvenience. It suggests a meeting of the signatories of the Convention to carry this into effect. The Belgian Government solicited the opinion of the Syndicate of Belgian aurserymen on the subject. In reply the Committee of the Syndicate expressed the opinion that nothing short of the entire abolition of the Convention would be satiafactory, and this opinion was received with general acolamation by the meeting. What ntsps the British nuraerymen and those amateurs who have occasion to send plants abro: $d$ will take, remains to be seen. Hitherto they have preferred to acquiesce in submisaion rather than endeavour to free themselven from the shackles. They have an opportunity now of atrengthening the hands of those who desire the abolition of the senseless prohibition, and it is to be hoped they will avail themselves of it.

The Outgrowing of Potator.

Whrre heavy rains have fallen, on land warmed by the late tropical heat, most varieties of the Potato will have commenced to push out a recond brood of tubers from those which are already well developed in the ctse of earlies and seoond earlies, and less so with late varieties. It is the natural consequence of a change from heat and drought to continued rainy weather, and nothing that the cultivator can do in garden or field will be of any avail short of lifting such varieties as are approsching maturity. These will inolude all early and second early varieties, which would be more injured by remuining in
the earth, than by storing them in a oool dark place that is fairly dry. The ordinary clamp will not do at this season, the weather at this seasor favouring sprouting in such store places.
In a season like the present, the advantages of wide planting become more apparent than usual; for the soil, being but sparsely covered by the shoots and foliage of the Potatos, is more rapidly dried by the sun. Moreover, should the disease attack them, the spores would chiefly fall on land under which no tubers are found. With crowded rows, say, from 2 feet for Ashleafs, to 3 feet for the more robust of the earlies and se:ond earlies, the tops oover the soil, and in the case of an attack of disease, the spores of the fungus actually fall on the ground beneath whioh the tubers lay, readily affecting them; in fact this method of planting affords no sort of protection against disease, but rather favours its spread.

If gardeners, and caltivators generally, would practise wide planting and the Jensenian mode of moulding up the stems, a double benefit would accrue in seasons like the present; the smooth, sloping sides of the ridges causing the rain to find its way to the farrows instead of soaking the former, the spores of the fungus, if any, taking the same route. All of this has been often repeated, but there are few who pay any heed to the voice of one crying in the wilderness. Our farmers will be found lamenting, as usual, the loss of money involved in a lessened crop of Potatos, a loss which in most cases is the natural outcome of a lack of preoantion on their part. Of coarse it is, to some extent, a question of expense. Does it pay better to lose a large part of a crop, with some problematical advantage in higher prices being got for the remainder of it, or to follow Jensenian methods? That is a question for experts. The consumer will get what potatos he wants and that are lacking at home from the foreign oultivator, and only our own growers will be any the worse.

The Haatbois
Strawberry.
Those about to plant should not omit the Hautbois varieties. The species is more distinctly delicious than cross-bred varieties; and the bayer should therefore ascertain from the nurseryman or the friend who supplies the runners, if the sexes are fairly well mixed in the plantation from which they were taken. Failing to do this he may get plants all of one sex, or but very few of the other, with the result that the bed will produce li'tle or no fruit. This may be a reason for the rarity of the species in gardens. The Hautbois suoceeds on partially shaded borders, or on one at the back of a wall sloping to the north. In good soil it is a strong grower, and the rows should not be less than 3 feet apart. Once planted on good ground, and top-dressed annually with well-rotted stable-dung or leafmould, a bed of Hautbois Strawberries will continue in bearing for a dozen years. Sometimes the plants in old beds, if annually manured, ran too mush to leaf, and some discretion should then be exercised in the matter of donging. There is nothing to be gained by frequently making plantations of this species, the plant seeming to succeed better when growing in thickish rows, which afford a good deal of shade to the fruits and the roots.

If a plantation appears to have seen its best days, the runners, which are sare to consist of a sufficient mixture of males and females, should be allowed to cocopy the alleys, rooting all over them, bat being thinned out where standing at a less distance than 6 inches apart. When the
fruiting season is passed, the old plants may be shovelled off, and the land where they atood double dug.

The varieties are the Royal Hautbois, one white, the other purple-fruited, and larger tha any of the others, as well as being rioher flavoured. Prolifio Hautbois (Belle Bordelaise) has small fruits, almost black on the sunny side, and on the shady side purple. The fruit has the peculiar flavour of the race.

Angrecum pellucidum (see Sapplementary Illuatration).-First introduced by Mesars. Lodara from Sierra Leone in 1842, and since that time ocer. sionally imported, bat only in small quantitien, this beartifal species may be caid to have never been gencrally cultivated. Although not having the large flomen of A. esquipedale and some of the other apecies, it has always been regarded an a plant of aufficient bearty to warrant its being more widely distributad in gardens when the enterprise of the collector wew fit to make a good importation of it. Oar illuatration, taken from a photograph of a specimen which has been growing for some years in one of the warm Orchid-houses in the gardens of Sir Trevor Lawbence, Bart, at Barford, Dorking, show to what beauty the plant may be made to attain by careful caltivation, ita long sprays of opaque cream-whits flowers depending from among the flewhy dark green leavea being gracefal in the extreme. Angracum pellucidam may be grown in a pot, but if $\mathbf{s o}$ caltirated means should be provided for anpending it when in flower, or the spikes are apt to stop thort and not display their full beanty. Generally speaking it requires the ame kind of treatment as the Pho lænopis-a warm moist atmonphere and protection from bright sunlight in summer.

Royal Horticultural Society.-The nex meeting of the Roval Horticultural Society will be held on Tuenday, Augatt 13, in the Drill Eall, James Street, Victoria Street, Weatminater. Ab 3 o'clock a paper by Mr. A. B. Fremman-Mitfond os "Hardy Bamboon" will be read.

Mr. Barron's Retirement,-In reply $\hat{1}$ namerous enquiries, we are in a position to atato that, after the long vacation, ateps will be taken to securt that a pablic recognition of Mr. Barros's long and loyal services to horticulture be made by hin friends, and by thone who value the conaciention diacharge of duty under very difficult and deprening circumatancen.

Leicester (Auaust 6). - The great exhio bition of Flowers and Fruits in the fine grounds of the Abbey Park commenced on August 6 amid ant shine and showers, and was a very accenful show, likely to recoup the Corporation for its lag outlay, and the energetic organiser and anpars intendent, Mr. Joun Burn, for the amount of ubout and anziety which he must have had before nucceeded in getting nuch a beautiful and harmoniout display in the six great marqueen in which the exhibits were arranged. At 1 o'clock the exhibition was opened by the Mayor, who, in his speech, which showed how truly he was a gardener in ham touched on some of the exhibite, and enpecially ond the praiseworthy display made by the cottager an of allotment gardeners, which he asid formed the mont natisfactory proofn of the beneficial renalis of these shown, which had now been running at the Abbey Park with increasing success for ten of thirteen yearn which had elapsed since the mill d Mr. Jomr Burn had redeemed it from an annigh maruh. A great crowd of visitors flocked to swod show, which embraced many very fine exhibits, weent the best being a grand diaplay of Begonise by Paro Ware, and of Caladiums by Mesurs. Joum falle Soz. In our next isaue we hope to give \& full account of the show.

The Ubefulnegs of Gardenina.-Sppalion at the Hawarden Flower Show Mr. Gudir remarked:-"You may depend apon it there is

immenae deal to be done in thi conntry by drawing forth the boanty of old mother Earth in detail. It is all very well to talk about machinery-and there was a time when people ased to think that the steam plough was going to drive hand labour out of existence-and undoubtedly in manufacture the advances of machinery have been astonishing; but as regards cultivation of the earth, as regards garden cultivation, as regards all mall caltivation, depend upon it there is more room than ever there was for both adding to the atore of the beautifnl product of Natare, with the capacity of producing which Provideace hat bountifally endowed the oil, and likewise of increasing. and largely increasing and consolidating, the efforts and advantages of raral life. The uas of gardens, the univeral provision of gardens, is a matter of the greatest importance to the country. It is of the greatest importance also, and mont desirable, that other wall holdings, as they are called, thould be multiplied; and I trust-I mont earneatly trust-the day will come, and will soon come, when thene holding will be made univeral."

The Royal Botanic Society.-The fiftysixth annual meeting of the Royal Botanic Society will be held in the Gardens, Inner Circle, Regent's Park, on Saturday afternoon, the 10th inst., at 1 o'clock. The meetingu, writes Mr. J. S. Robinstern, Hon. Auditor R.B.S., 56, West Cromwell Road, S.W., have been held on the same date aince the Society was founded in 1839, bat if they were to take place at a more convenient period of the year, a much larger attendance of the Fellowa would uadoubtedly be secured, and it in thought by many that in this and in other matter the charter might now with adrantage be revised. The businesa to be transacted include the election of eight members of the Council, the presentation of the Council and auditors' reports, and the consideration of a resolution to be moved by Mr. J. S. Rubinstein, congratulating the Society on the great success of the experimental opening of the Gardens to the public on the Bank Holidaya and other day this jear, and recommending the Council to admit the public to musical promenade to be given next season on the afternoon and evening of every Monday and Saturday.

Torquay District Gardeners' AbsoCIATION. - The third annual outing of the above Society took place on Tuenday, July 30 , when about forty member proceeded in brake to Ashburton, Buckland Drives, Widecombe-in-the-Moor, and Heatree, By the kindnens of Mr. B. J. Bastard of Backland Court, the party were permitted, under the gaidance of Mr. W. Lirace, the head gardener, to pass through the most choice parts of the grounds. The grandear of the acenery commanded from the middle drive at this place is unsurpassed in Devonshire. Luncheon was had at Widecombe, and by the permianion of $\mathrm{Mr}_{\mathrm{r}}$. J. Kitsors, an inspection was made of a portion of the plantations recently made at Heatree. It was remarked that the Rhododendrons were exceedingly thriving, as were alno such Conifers as Caprescua Lawnoniana, C. macrocarpa, Thuiopaie dolabrata, and many othern. These did not appear to have anfered at all from the severe winter, in pite of the exposed moorland position. The party started on the homeward journey via Manaton, Becky Falle, and Bovey Tracey, an enjoyab le day having been apent. Mr. F. C. Syale (Hon. Sec.) was remponaible for the arrangementa.

## Cotton, Coffee, and Vanilla Culture in

 TAHITI.-Referring to the cultural industries of Tahiti, the Britith coneal states that Cotton has always been the favourite culture of the native population, but owing to the extremely low prices that have latterly ruled, both locally and in Earope, its caltivation is being gradually abandoned. Tahiti Cotton no longer paya to produce, and it would be an excellent thing for the island and for some of it dependencies if the native could be indaced toundertake in ite place the culture of Coffee, which grows in the imland under the most favourable circumatances. The quality has been declared by Europeanand American expert in Liverpool and New York respectively to equal West Central American in aroma and in general quality. Coffee would be the ideal cultare for the natives, bat to far only a few of them have been induced to set out small patches, for the reason that an they only live for to-day, they cannot as yet be persaaded to undertake an enterprise from which a return can only be expected after the first three yeary. The one attempt made by any foreigner in this direction-a amall plantation of seven acres, planted some three years ago-shows conclusively that this enterprise could be made to pay. The annaal production of Coffee ia at present 3 to 4 tons only. The cultivation and curing of Vanilla in Tahiti is being neglected in consequence of the inferior quality as compared with that of Mexico, Boarbon, and Seychelles, and the corresponding low price that it command. A hope, however, is carrent in the island that the market value may be increased by the adoption of a more efficient method of curing the bean than that at present in use. The annual export of Vanilla is about 15 tons.

Isle of Wiaht horticultural improveMENT Association, - At the recent monthly meeting of the above Association, held at Shanklin. there was a good attendance of membera and friends to hear a paper on the "Caltivation of Taberousrooted Begonias," by Mr. W. W. Sheath, of Ventnor. $\mathrm{D}_{i}$. Groves, B.A., J.P., presided. The paper contained some valuable advice on raising needlings, and their general cultivation. Begonia flowers were contributed by Mears. Cannell, Laing, and Box. The next meeting is to be held at Ventnor on September 7, when a paper on "Hardy Trees and Shrubs" will be read by Mr. C. Snoor, late of Kew Gardens.

Lilies at Twickenham.-Mr. H. A. Tracy, The Orchid and Lily Nuraeries, Amyand Park Road, Twickenham, grow Lilies extenaively for cat bloom; he has been catting for a considerable time, and there are atill succeasions coming on that will lengthen out the season some week longer. The principal varietien grown in quantity are Lilium longifloram var. Harrisii, L. apecionum var. Melpomene, and L. n. album novam, the lant-named being considered the parest white, while Melpomene is the richest crimson variety of the fragrant L. speciosum. For forwarding to a dietance the flowers are cut in bud just before they open, and at the end of the journey they open fresh and clean, and last a long time, The last few buds on the spikes are cut together with long stalks, and are mach sought for use in indoor decoration.

Forcing Lettuces in Pots.-In a recent Bulletin of the New York Agricultaral Station, we find a paper on this abject, of which the following is the sammary:- The growing of Lettuce in pots is believed to have several advantage over growing it in benchen, namely- 1 , by inducing a compact growth, and favouring early heading; 2 , the plant are tranoplanted but once, that is, from the flats to the pots, so that the growth is not checked bs a second transplanting; 3, plants may be marketed without disturbing their roots, and so they may be kept perfectly frewh for a long time-an advantage that is much appreciated by retail dealers; 4 , as moon as a plant is removed from the bench, ite place may be immediately filled with another potted plant, so that the entire bench-room may be kept conatiantly occapied. The method may be briefly outlined as follow: -The bench, 6 incher deep, is half filled with well-rotted manure, over which is spread 3 inches of soil. The soil is made of one part by mesuure of msnure to three parte of rotted sod. Should the sod be from a heavy loam, it is made lighter by adding one part by meature of sand to three parte of sod. The plant are tranuplanted but once, and that is from the meed flate to 2 -inch pots. The pots are plunged into the soil on the benches, so that the tope are covered with nearly half an inch of soil. The diatance between the planta on the bench varies with the variety, but is usually 10 incher each way. Before the pot is plunged in
the oil, it is turned apaide down, and the underside of the leave thoroughly dacted with Tobacco to prevent attacke of aphis. The upper-aide of the leaves is then dusted with Tobacco, and about a week later the plant are dusted again, being eapecially careful to apply the Tobaseo thoroughly in the tender centres of the growing piants. As to the care of Lettuce ander glans, is may be aid that the house should be kept at a cool, even temperature, ranning a few degrees above fify in ths day, and remaining at fifty or a little below at night. Sudden flactuations from high to low temperature, or vice versa, should be avoided. The plants should have plenty of fresh air, enpecially on manny dayz, when the temperature is high outaide. When the planta are watered overhead, it is best to select a time when the foliage will dry quickly. Avoid watering so late in the day that the plants will not dry before night.

Vriesias.-M. A. Griessen in publishing, in Le Jardin, some usefal tables, giving the names of hybrid Vrienia obtained elsewhere than in France. The history of the discovery or production of each variety is brietly given, and M. Griessen in doing service in thus pablishing the origins of the plants now, before, by cross-breeding, they have become too intricate to be traced.

Henna.-The Henaa plant (Lawsonia alba), which is a shrab foand widely diatribated throaghoat India, Peruia, Kardiatan, Syria, Egypt, and Northern Africa, sad which is so well known for the use of its powdered-leaver as an orange-yellow dye by the Egyptians from remote antiquity, seems to be somewhat extensively grown in the gardens outside the city of Tripoli, where it is asid to be highly appreciated by the people as a dye. The tixige and leaves are gathered three timas a year, the root, which is allowed to remain in the soil, reproducing the plant almost indefinitely. The Arab women use it to stain their feet and finger-nails, and it is said to be very effecacions in theicure of chilblains. Last year the value of the exports of Honaa from Tripoli, chiefly to Tanis and Algiers, scounted to $£ 8000$. The mode of prepariag $H$ ana in the Eist is very simple, and consists of reducing the leaves and young twige to a fiae powder, to which eometimes in added a little Catechu. To use it-the powder is made into a pasty mans with hot water, and apread on the part to be dyed, where it is usaally allowed to remain for a night before being washed off.

VALONIA.-The growth of the Oak plantation: in the island of Z 9 , one of the Cyclades, is said to have increased in a remarkable degree of late, and a corresponding increase in the next crop of Valonia is anticipated. The acorn-cap containe a large proportion of tannin, and is convidered in quality equal to that which comes from Smyrna. The average annaal produce is from 20,000 to 30,000 quintals (one quintal equals 1232 b. ), but on favoarable occasions even double that amount is reached. Last year's produce was eatimated at 25,000 quintal. valued at $£ 10260$. Aboat 15,000 quintals were sent to Trieste, 7500 quintal to Great Britain, 2500 quintals to Italy, and the rest to Syra.

The exportation of Cut flowers from HOLLAND.-A was annoanced in our inave for July $\% 7$, a meeting took place at the Hammume Hotel, Covent Garden, on Jaly 26, for the purpose of forming an avnociation to oppose the exportation from Holland to this country of cut flowers by thone who have sold bulbs for forcing to English growert. The meeting repreaented the horticultaral trade, sind a committee pro tem. was appointed to draft ralen, sc., for the management of the anociation. It it proposed to call another meeting shortly, but in the meantime the committee deaire that all who are willing to join the ansociation hould communicate with Mr. C. H. M. A. Alderson, Hildu Vale Road, Farnborough, R.S.O, Kent.
flowering Plants of New South Wales. -The Government of New South Wales is publinhing a series of coloured plates illastrative of plants of conomic value. The work is edited by Mr. Marors, - sufficient guarantee of ith excellence. Mr

Matden is ansiated by Mr. Campbell. The platen are characteristic, and the letterpress popular but accurate, including deacription of the plants and indication of their ases. The Waratah, Telopea apeciosissima, Eacalyptus corymbosa, the blood wood, Actinotas Helianthi, the flannel flower, the Acacia glaucescens, the coant Myall, are the planta figured in the first part.

The Great failure in Turnips and Mangels-To meet the sbove, Mr. Matbice Moriarty, of Mallow, Ireland, writes:-"I have many hundreds of millions [!] of Cabbage plants in variety which I will give away to anyone who may zend for them. Scotch and Eaglish seed merchante will not take them, being disappointed in not getting a apecial traffic rate, and farmert and others may as well have them an for me to plough them in."
horticultural Club.-A very accessful excursion wan made by tome of the members of the Club and their friendin on Tuenday lant; the first place visited was Claymar, Finchley, one of thone extensive establithmenta which have of late yeart aprung up in the neighbourhood of London and other large town for the parpose of growing Grape and Tomatos. It was a revelation to many of the vinitors to see houses 450 feet long filled with Grapes, one house having seven tons of Grapes havging in it. When they are ripe it mast be a wonderful sight; at present they are jast beginning to colour. The party, numbering forty-three, was hospitably entertained by Mr. Peter Kay at laucheon, after which they drove to Hatfield, where they were conducted throagli the park and gardens by Mr. Nobman, head gardener to the Marquis of Salisbitry, who had kindly given permiseion to visit this noble place. Afterwarde the membere adjourned to the Red Lion, where dinner was served at 7 o'clock. There was ah ananimoan opinion expressed as to ita 'being one of the most enjoyable exearsions the Clab had ever made, and the members were deeply indebted to Mr. Kar, who undertook all the arrangemente, and under whowe able management everything went off plearantly.

## PLANT PORTRAITS

Apple Jefferis, Garten Flora, August 1.
Brownea areiza, Jentham, Illust. Hortico'e, Jaly 30
Carpinus cordata. Japan, Garden and Forest, July 24

Spheralcea abutiloides, Garden, July 20

## Home Correspondence.

THE LATE JOHN WILLS. - All your older readers will endorae "R. D.'" genial estimste of the character and geniun of our departed friend. Our first friendehip was formed over Viola cornuta and the pure white variety, the latter being atill one of the mont striking and aveful. Though our paths lay in apponite direction through mont of our lives, our friendehip continued. It would be almost an impertinence to add a word to his great work, so well dencribed by "R. D."" though only those who knew what table and room decoration were when Will atarted can appreciate how much modern bouquetiste and decoratore owe to Mr. and Mru. Will. Bat there was one featare in hit character that I may be permitted to refer to in the Gardeners' Chromicle. Few men had more power of diccovering ability, or were more denirous of pushing young men of talent to the front than Mr. John Wills. And not afew of thome that he virtaally made decorators hold high ponitions to-day sither in the frim or other ontablishroent of high atanding in this new induatry which Mr. and Mrs. John Wills may be naid to have created on a broader bavis and more artintic
linem, $D$ T. F.

8T. DUTHUS PEA.-I way pleased to see a note in your paper of Jaly 27 recording the excellence of this little-known Pea, I have cultivated it thit
"A. H." asyn it is. It atand dry weather better than any other Pea, and even now the haulm ound and green and pods fit for picking, although the seed was sown on March 19, at the ame time as Sutton' Prolific. Since then I bave sown Early Champion, Dr. Maclean, Veitch' Perfection, and other varieties; gathered their crops of pods, and cleared the ground of them, in one or two case cropping it again. The dry eason and a beavy atiff soil have mainly cuntribated to these Peas passinz away so quickly. St. Duthus, however, has stood well. I find it rather longer in coming into ane than some others, bat when once the pods become fit for table it continues for a long time in bearing. The pods are well filled, eight or nine seeds in almost every one, of a deep green coloar, and the flavour capital. An a mid-season variety it is, I think, very valuable. I have tried this season Veitch's Ranner French Bean, anwing it at the ame time as the ordinary Scarlet Ranner. and this is proving a naeful Bean, ruaning well and producing a splendid crop of podz, tender and sweetflavoured. Satton's Epicare and Tender and Trae Bean are also very desirable variaties. The French Ranner Buan I obtained from R. Veitch and Sons of Exeter. W. Swan, Bystock, Exmouth .
a red maréchal niel rose.-I noticed a paragraph in your issue for Jaly 20, p. 64, an abstract from one of the German horticultural papert, of a red Maréchal Niel Rose, raised by D:. Mü ler, and the result of a cross between the above and General Jacqueminot. What a lovely Rose this mast be, and what a great pity if Dr. Müler doen not send it out for the use of the general public, and so pat it within the reach of all. What a charming flower it mut be if it have all the characteristics of the type W. Bow'es, Adare Manor, near Limerick.

CATTLE POIBONING BY THE COMMON YEW. In an article in the Spectator on the materia medica of animala about a fortnight age, is a mistatement reapecting snimala and the leave of Yew, which it is worth while to correct, because many people do not underatand about the poisonoua quality of Yewn. In that article it is atated that animals which have constant access to Yew avoid eating it, knowing it to be poisonous. This is quite untrue. On the contrary, they habitually eat it and are very fond of it, and no one ever heard of their being the worse for it when they eat it in this manner. I have no doubt that it is to them a stomachic and promoter of appetite. Farm lada are nometimes prosecuted for killing farm horses by giving them powdered Yew leaves, and I find, on inquiring what they do it for, that they give it to make the animals eat their corn, when they are only getting corn and are tired of it. Now dried Yew leaves are undoubtedly more poisonous than green leaven freth from the tree, and if they give the least bit too much of it, eavecially if the horses are not accustomed to eating Yew leaven, it is liable to kill them; but the leaves of the growing tree are also dangeroun to animaln which get access to them andenly, and when they are not accustomed to them. All the casel of Yew poisoning that I have ever known or heard of have arinen that. I know of many places where there are Yew trees in the pasture-fielde and in the edjoining hedger, and any one who will take the trouble to look at anch ones will see that they are habitually browaed by the cattle. I believe that the best afeguard againat Yow poisoning is always to have Yew tree within reach of the cattle, and I therefore constantly plant Yew trees in the hedges of pastare-fielde, or in the fields themselven. C.W. Strickland.

QLOXINIAB AT TRING PARK.-Few planta are more ahowy at this season than Gloxinias, when well grown ; and the fine atrain now obtainable from the leading seedmen give varietien of much beauty, A houseful of them is one of the sights at the prement time in Lord Rothechild's gardens at Triag Park. Mr. E. Hill, the gardener, hat arranged the plants together with Isolepir gracilis, the latter also forming an edging to the atage on which they are placed. The atrain is characterised by the brilliancy of the acarlet and crimson forms, and the grea beanty of the potted varietien, the potting and marbling being in all thades of row, criconon, and parple. The foliage is large and manive. Great caltaral bkill is required to bring so many Gloxinia plante to auch perfection, bat they are well worth the trouble, J. O'B.

RICHARDIA PENTLANDI.-An bearing on the re marke on yellow Richardian in their native habitat far-
nished by Mr. Cban. Avras of Cape Town (Gardeners Chronicle, Jane 22 p. 764), it will interest bim and others to know that some of the tubers collected by him are sending up their rich golden-yellow spath in Lord R sthochild's garden at Tring Park. Both the plain green-leaved and the spotted-leaved varie tie:, representing R. Pentlandi and R. Elliottian, seem to have been collected together, for both appear in the batch received from Cape Town. The pathes, althongh seeming to differ slightly from those of the forms previously in cultivation, are very handsome, and in most of them a more or leas dend purple eye is at the base of the spathe. Mr. Hill, tho gardener at Tring Park, pots them in good roagh soil, sach as is generally used for balbs, and grom them near the glase of the roof in an intermedian hoase. J. $O^{\prime} B$.

TABLE DECORATIONS AT THE NATIONAL CAR NATION SOCIETY'8 8HOW.-It appears to me that the committee of such a society as the above-named, when offering prize for the best arranged dinnertable decoration, should certainly use more dircrimination in selecting the judges, and should alm word their achedale more explicitly, atating whethe the object to be attained is quality of the bloom employed, or on the other hand the display of tuta and skill in their arrangement. Tu my mind the judging in the decoration classe at the Cryal Palace on July 24 was most unsatisfactory, the verdict in almost every case being in farour of quality of flower, no matter how heapy or clamer the arrangement. In class W., fur the beat arranged dinner-table, the 1 st prize was aparded to an exbibit which, although containing some superb blooms, nu arranged in anch a manner that no person of tatit would tolerate it on his dinner-table, the objes evidently being to crowd on as many blooms as the table was capable of holding, totally regardlen of the apace required for plates, \&c. I am unacquaineo with the jadges who were responsible for thene del. sions, and do not even now know their namet, bat am certain that however estimable they may bo il other respects, they were totally unfit to jadge in cases where taste and refiaement are the necemarg qualifications. I must apologise for taking op so much of your valuable sace with these remain, but it is a subject in which I , in common with ma others, am depp'y interested, and it il a caane much regret to notice that the best exhibion are being driven out of the competitions throgg the incompetence of the judges selected for the decision of the award in thene clasien, obvious that the skill necessary for this purponi siltogether different from that required in the gromad of flowers, and might we not expect to find far man all-round satisfactory decisions coming from who have had years of experience in this mol art of table decoration? F.W. Seabe, Time Nurservan Sevenoaks.

8LUG8 DESCENDING BY A LINE OF SLIMESome years ago I remember aeeing in your columin a remarkable tatement from an eye-witaest wad a slog let itself down from the glass by a rope memes by it own alime to a subjacent plant. No nowe wat ever made by anyone upon it-pernaps niby felt equal to capping such a statement ; pomilich was passed by an a fact, and need not and hope further. I did not donbt the atatement, an wis some day to observe the mame myself. them in this case) who waits all thinga (even what I am writing on, readers may wy). day my gardener pointed out to me a no plath Lilled after having so let himself down to appol The alug wain nearly 3 inchen long; he to an Olow the glass, and did not know how to ges below him toglonam cordatum that bung 7 incter blas, a patain He slimed all around himself on the ghmelf dom of 2 inches in diameter, and then let wis in to the plant, touching the uspending wire fime descent. After be had alighted, the rope of atill hang from glass to plant. This rape el fact will now, on a second notice, porvil on further corroboration from other observeri Crawshay.

THE BWEET LITTLE DEAR LITTLE, GHAMTOC of ireland.-Mr. Baylor Hartland from Ireland in December last, saying that on Sher newly broken groand in his garden a crop the rock had suddenly oprang oo. anmen is Amen harvented the seed for asle to Irishmen come rib $\mathrm{H}_{4}$ kindly ent me some seed, which hssure in 1 Th Trifoliam oiaus. In my littiowork,

Shamenck, procuring them from Ireland on St Patrick' Day, and that on arriving at matarity they had tarned out to be different pecies of Trifoliam or Medicago. My evidence wat apported abortly afterFards by Mr. Colgan in the Irish Naturalist, who records obtaining thirteen undoabted Sbamrocks
of my own raising and crossing. The seed was sown in the spring of last year, the eedlings were planted out in a border in the open as soon an large enough, where they remained ever since, and are now flower ing; the border received no pecial preparatior neither have the plant received any apecial atten-
a very moky and cold district. not at all 'avourable to the Caration. J. Eughes. (A remalkbly fine lot of blosoms, large, the selfs of various ahade of pink, rost-crimson, white, palest flebb, primureeyellow and the acarlet fake very fall, with netala baviag great sabatance and parity of tiats. We do not re-

from various sources, eight of which proved to be Trifoliam minas, five T. repens. I am afraid Irishmen must raconcile themselves to the belief that Stam rog, Little Trefoil, is a name common to all triphyllate plante found growing on March 17, and that the Irish Shamrock, like the Scotch Thistle, bae no independent exiatence. W. Tuckwell, Augutt 3.

BEEDLINQ CARNATION8.-By to-day's parcel pont I mend you a box of Seedling Carnation blcom
tion. They were all raised from eelf-coloured flowers and my object was to raise varieties with self coloured flowers. I do not care for flakes, \&c. Many of the flowers of the white varietien are very like each other, but the plantu are very difereat in growth. All the varieties are very free bloomers. atrong growern, and throw plenty of "grase." You will botice that the petals on arme of the flert are damaged, which is owing to the very rainy weather Fe have been having for some week pasta. Oarlis
member to have seen finer flowers from an outaide border. All of them are quite worth perpetaating. ED]

Ma. A. F. BARRON.-Seldom bai it been the lot of the Gardeners' Chronicle to create a deeper or more profound seneation amongat gardeners than was the case late week. To how many did the announcement renpecting Mr. Barron's retirement from the direction of Chiswick Gardens come as a surprife, at
well as pain. Is the Frait Committee therefore to be alto deprived of Mr. Barron's entimable services or may he continue to hold his post of secretary till the end of the year, and then become a member of the body of which he has so long been the secretary? To deprive that committee of advice and knowledge which no other man can give or possemsen, would indeed be a misfortune. I am sure that any suggestion to that effect wonld create amongot the members grave regret. It has been Mr. Bicron's fortane to have earned far and wide a most distinguished repatation, eapecially as a fruitist, but his knowledge of vegetables is also unique, and this snowledge has always been at everyone's service. Whotoever followa Mr. Barron at Chiswick will find he has to occupy a difficult position. I am no believer in the idea that the man for the place cannot be found, but the best of men mast naturally feel modest in entering upon the aperintendence of Chiswick, and the other the superintendence of Chiswick, and the other
accessory duties-indeed, only one endowed with more egotiom than wiadom would feel otherwise. Ot coarse, in time courage and confidence will come, especially if the anccestor has the needful knowledge and other qualifications. Still, let the successor be who he may, our regret at the loss of no able and so worthy a superintendent and secretary will be very great. How far the Royal Horticultural Society may beneft or otherwise remaina to be seen. $A . D$. We have other letters to the aame effect, but it is deemed better to defer publication till after the holiday mearon. Ed.].

WEED-KILLER.-I can fally confirm the statement in the note in last week's issae of Gardeners Chronicle, respecting the cantion there given of the poisonions nature of the weed-killer. Early in the paut itpring I ordered two drums of weed-killer from a well-known firm; the drums duly arrived at the atation, where a cart was sent for them; but ai the road where the mixture was to be used lay on the way home, the drums were dropped down, to be used the next day. There were severil heifers in the encloanre, and my attention wat called to thete benata licking round the drama, more eepecially on the top, where, with the jolting of the railmay and cart, together with the hot weather, a little escape from the bang was observed. 1 impediately had the top of the drums covered with dry mand. Alas! one heifer died. It in an excellent mixture uned for what it is prepared Sor. P. F., A.

## New Invention

## the fatent stampord hoe.

Whev hoeing the land amongst clomely-ranked sitchen-garden crope, bedding plants newly put out, or the occapants of the herbaceous perennial border, the value of a tool which will not readily injare the steme and flower-stalks of the planta will be conceded by everyone having acquaintance with this kind of operation. The old-fashioned Datch hoe, with its rectangular corners, was liable, even when uted by carefal men, to injare the planta, more eapecially when the blade was hidden from the view of the uarer by the leaves of the plants. With the hoe illuatrated in fig. 32, p. 163 , no auch injury can be done, the free cornere being done away with by the manner of fixing the blade to the bow. Moreover, this hoo can be used as a draw-hoe, by bringing the cutter at the back into play, which is done by the workman slightly lowering the handle and drawing to inotead of puahing it away from him. The blade being of oteel, is very darable, and keepi a good edgo for a loag time. The patentees and makera are Meurrs. Pick \& Fountain, garden-tool makera,

Belgium.

## M. Jacos makoy et cie

Turs firm is noted for the cultivation of many uinde of plants $;$ thua, in the Fern-hoose, I noted vome excollent little eppeciee and varietiee, such as Adiantum eapillue-veneris tenue, ppecially valuable in winter owing to ite bardineas; A. cuneatuam grande, a very pretty novelty, unefal for floral decorations; Pteris creticas Wimeetti, very oraamental

large uncut leaven; Adiantum Bellam, usefal in winter ; A. tessellatum, one of the finest of Adiantum ; A. Kerchovei, renembling A. Birkenheadi; A. rhodophyllum; A. tenuiseimum, difforing but little from formosum, and other varieties. A good plant newly pat into the market this year, and aseful for beds and bordert, is Raellia Makoyana; Begonia Dachess of York is also a satisfactory introduction.
Among the Pandanas in MM. Jacob Makoy's houses I noted P. javanicus fol, var., prettily variegated with white; P. Baptisti, very elegaat, foliage velvety with a double yellow line along the mid-rib; P. graminifolius, and P. coneedens. Mach to be recommended is Eucharis Lowi, which is alwaya valued for ite useful qualities. Among the Marantas was M. rosea picta and M. Lonier. Asparagas Sprengeri, much used in Germany for decorating purposes; Rhopsla corcovadense, also uved as an indoor plant; Aluphila Malzinei, an excellent Mexican Fern, atd Asplenium laxam, deserve attention from plant lovern. Vriesia aplendens major is an excellent plant, as is also Nidularium ratilans with ite pretty rose tint; and so is Rhodortachys andina. A number of Dracera lentiginosa were remarkable for the dark colour of the foliage. A new plant for out-door use which seems coming rapidly into favour is Pgrethrum parthenifoliam glancum; with its whitish or glancous foliage, it might be likened to a Gymnogramma growing out-of-doors. Ch. De B.

## A New Horticultural Establishement.

A new horticultaral ettablishment has gradually been eatablished in East Brasels, and is now quite completed, and already contains some thouasind plants of Cattleya and of Cypripedium. It is MM. Linden who have atarted this enterprise, and we think that when it is open to them, plant-lovers will tind much to interest therein. In this, a brief preliminary notice, I will only aay that, bailt on the plan of l'Hurticultare Internationale, thit place is of larger extent, in admirably arranged, and fulfics all requirements for the cultivation of Orchids. MM. Linden will caltivate choicer species of Orchids, and are preparing to raise nome new varieties, For this parpose they are collecting considerable quantitien of Cattleya, Cypripedium, \&ce, that they may make careful selection. Erected in an open aituation, where there is no lack of fresh air, this establishment atarts with every chance of aucceas, and is sure to take a high place among Belgian nurseries. $C h$. de $B$.

## SEEDLING ORCHIDS.

Bersa much interested in the hybridiastion of Orchids, it has always been a wonder to me why so few seedlinge ever came from the millions of needs mown. Years ago I sowed a pod of Cattlega Dowiana $\times$ C. Warscewiczii, and a glorions crop of seedlinga in due time appeured on the basket containing the mother-plant, for it was the nurface of the basket that I considered the best place for weed at well at parent. They dinappeared in a mont extraordinary way. Healthy little embryos went in a day or two, and gradually all went. No one could imagine how they went no fatt, and left so little trace behind. At laet it dawned on me that the barket in which the plante are dipped is the ocean-grave of the zeedling embryo They have no root to hang on by, the plant when dipped makes waver ap the comport, and the backlash carries the drowned seedling away, never again to be neen. The dipping rendered a divastrous death to the fatare hopes of the hybridist; it neede great care not to dip plante too deep that have seedling on them. Seeds themeelven float away by the million, and are no doubt put down as bad. To avoid all this lons, sow seed on prepared poter or pans, and do not let them ever get too dry, or the living need will shrivel. I have to-day exsmined aboat sizty nowinge, and I find invariably that the seed is germinating far better, when the peat on which it is contains a large proportion of earthy matter. Where it is very fibrous indeed, it does not hold enough water for the keeping of the seed plump, and it soon abrivel.

Care must be taken not to have peat too earthy, ce moss too long, or the need will get covered by it This is fatal, especially to Odontoglonum med, which seems to like a hard bare spot to germinath upon. Water very carefally, so as not to flood the seed up the pot, and treat it as a delicate plant, with all the care and attention possible
Some pode contain but very little good reed. I one to-day, L. anceps $\times$ L. Crawshayana, that had but a few fertile seeds to thousands of chaff-cchen, U'ader a atrong lens it is very easy to nee the good and bad weed: one contains veritable moistare andin tranuparent, the other is a silvery-looking akin. If a few more growers would carefally prosecute hybridisation we should soon have good result, even in O lontoglossum, hitherto the crux of the hybridit, and where lies the greatest field for fatare realich To raise hybrid when Nature cannot do it will beth unite Colombia and Mexico, a triumph that is worth trying for. De B. Crawshay.

## SOCIETIES.

## COTTAGERS, ETC., HORTICULTURAL, ST. OSYTH'S.

Joly 25. - I have already noted nom 3 of the fined Roses in the two fine lots of forty-eight bloomi staged by the great growers, Mearra. Benjamin and Frank Cant. Among these were many bloom worthy of those great growers and of the diatrict Bat though liberal prizes were offered in the smb teur classes, the diaplay from these was not astirfactory. The Priory Garden and its products, $n$ conspicuous alike in the show tents and in the garden, prove that most things, inclading Row may be well grown in this district, and it is hoped that the fine object-lesson by the trade will reant in a vigorous effort next year to pull the Rosen of amateur up to something approaching high trade atandarde.
In other sections the St. Osyth show was well arranged, richly furnished with creditable productions. The first section was devoted to cottagers, who had forty-seven classes demion to them. In this section, too it was pleasing to find the Royal Horticultural Society of London offering through $y$ W. Watson the Bronze Banksian Medal of the R. H. 3 to the cottager who wins the largest amount of money in prise an the show day. Section 3 was devoted to childrea, who shome in four clasees. Bection 3 (arnateurs) contained twentrotmo classes devoted to truit, vegetables, and fiowers. section contained classes for a collection of fruits, and a collectiond cut flowers, open to all comers. Section 5 was derobed th home ind ustrics.
Then there were many special prizes offered by the thitic and others. Altogether the schedule of the Society is exw lent and comprehensive, exactly suited to a village coammnity, and other societies could obtain many nints from same were it before them. There seems abuadant room in and around St. Osyth for the improved calture of flowers and window plants. Stocks seem almost the only flowers the are well done outside the Priory Gardens in which goi culture, plenty and beauty every where prevails. D. T.

## THE MIDLAND CARNATION AND PICOTEE. <br> July 31 and August 1.- 1 aplendid Estibition

 Wha held in the Botanical Gardens, Birmingham, the above dates. All the available apace was oceripied bs exhibit of high merit, and if the Sociefy continues to grow an it has done during the pust teme yearn, a larger place of exhibition will becone necensary. Me. G. W. Latham's resources foud taxed toEleven stands of twelve Carnations competod, same virf fine blooms being staged, Mr. R. Sydewham, Birmiigg taking the lat prize with excellent bloons of C.B. Nu Hedderly, P.F. Gordou Lewis, C.B. Master Fred, B. F. . His Rowan, S.F. Guard jman, P.P.B. Sarah Payne, P.E. C. Ward wood, S.B. C. H. Herbert, P.P.B. Fred Philipe, S.B. E. P.P.B. Seedling, and R.F. Rcb Roy; 2nd, Mr. TOMC Loav, with some very good flowers.
There were ten sbands of six Carnations, Mr. C. F. TIIN STAE, Wolverhampton, taking the 1st prize with S.B. B. Imbub grave, P.P.B. Sarah Payne, and W. Skirving, S.Y. G. S.F. Miss C. Grahame, and R.F. Oristagalli ; 2nd, Mr. C. Hebden Bridge.
The best twelve Picotees came from Mr. T. LoRD, flothtite Todmorden, who had refined blooms of H. Red E. Bitle Puil H. Ro. E. Mry. Rogers, H.P.E. Zerlina, H. Bo. E. E. Blam H.P.E. Mr. A. Chancellor, L.P.E. Esther, L. and L. Bo. Heard, H.PE. Muriel, H. Ro. E. Mrs. Sharp, Thome Campanine, L. Ro, R. Mrs. Gead Mr,

With six Picotees, Mr. A. W. Jovrs, Birmingham, took the St prize with the best stand out of nine, having H. Rod E Bruatte, H. Ro, E. Mr. Bu'goss, H.P.E. Amy Robsart L.P E. Euizabe

Yellow grounjs were a great feature, and the blooms very fine, Mr. A. W. Jones taking the lat prize with twelve superb loome, baving Bomulu, Stadtrath Bail. Annie Douglas, Cartinal Wolsey, Almira, Mrs. R. Sydenham, Mrs. Whitbourn Mrs. Douglas, The Dey, Ladas, Mrs. Dranfield, and Janira 2ad, Mr. R. 8 fidenism.
There were ten collections of six blooms, Mr. A. R. Brown being lst with fine examples of Mrs. R. Sydenham, Mrs Donglas, Ladas, Harlequin, Mrs, Gooden, and Mrs. Henwood 2nd, Mr. E. Hill, Bulwell, Florrie Henwood, President Carnot, and Janira being very fine.
Selfo were very bright and effective, Mr. R. Sydenilam tsking the let prize with the best of eight stands, having Miss andrey Campbell, Mephisto, Rudoxia, Corunna, Ruby, TheoAndre, The Pasha, Fire King, Uncle Tom, Annie Lakia, Rob Roy, and Abigal; 2nd, Mr. T. Lorn, who had repy fine Mrs. Roy, and Abigal; 2nd, Mr. T. Lorn, who had
Gaskoin, Bluehing Bride, and Gentle Jackie.
Gaskoin, Bluehing Bride, and Gentle Jackie.
There were ten stands of Self, Mr. A. R. Brown taking the ist prize with Duc d'Orleans, Waterwitch, Uncle Tom, Miss A. Campbell, Mrs. Fred, and Hajee' Scarlet; 2nd, Mr c. F. Thlerstan

There was a maiden class for six Carnations and Picotees, M. W. F. GoodreLlow being 1ath and Mrs. Herbert Emitre 2nd.
These were also classes for blooms dressed as little as possible, though how to exactly hit upon the amount allowed is not tatel. The blooms, which represented all the types, were set p with their own foliage, each in a specimen glass. Some fine blooms were staged, and they certainly had a more atural appearance than the blooms in the previous classes ome of which were over-dressed. Four clases were devoted to these, and ther filled a good space of tabling.
Of single blooms there was an immense array. The leading 8 B.'s were R. Hoularave, Arthur Modhurst, and Master Stanley: C.B.'g, Edward Schofield, Bifleman, and J. 8. Hedderly ; P. and P.B.'s, Fred. Phillipe and Wm. Skirving S.F.'s, Sportoman and Wm. Mellor: P.F.'s George Melville Magpie, and Martin R,wsn; R.F.'s, Mrs. Rowan and Crist: ralli. Of Picotees: H. red E., Brunette and John Smith L. red E, Mra, Gurton and Thomas William: H.P.E. Muriel and Mrs. Openshaw L.P.E. Summerhill, Pride of Leyton and Rlizabeth: H.Ro.E, Mrs. Rogers, Campanine and Edith D'Omhra'n; H.9.E, Mp. 8iarpe; Lt R). or Scar E. Favourite and Nellie. The best white selfs, Mrs. Lee and Mrs Fred. The best yellon. Germaia an 1 Mias A. Campbell. The est pink or rose seedling Ruby and Rob Roy. The bett dark Moncesu. The best sellow groands, Mrs. R. Sydeaham and Mre, Goolea. The beet tancies, Romulas, Cardinal Wolser, and Duche of Purtland.
Border Caraations in buaches, thown in four clasees, wore very iffective, Messrs. Thomson \& Co, and Mr. H. W. W FGU゙ELIN, Teignmouth, taking the leading prizes.
Carnations in puts were represented by admirably grown and bloomed plants from Mesars. B. SyDENHaM and THomson \& Co. The bett six plants of German origin competiog for a special prize givea by Mr. Ernest Benary of Exfurt, came from Mr. R. SyDenilsm, and well represented the celebrated Erfurt strain.
Table Decorations in Carnations made a very fine feature. For a dining table 6 teet by 3 feet, good prizes were offared. Capt. Thewles, Keailworth, was lat, and Mr. W. F. Gunn. 2nd. Shower bouquets, Sprays, and Buttonholes were well shown.
Premier Flowers.-The promier bizarre Carnation was C.B. J. S. Hedderley, from Mr. Br, 8ybenham; premier flike, P.F. Geo. Melville, from Mr. A. R, Browr. The preraier H. edger Picotee, P.E. Mariel; light-elged rei E, Mrs. Gorton, both from Mr. A. W. Jones ; Y.G. Mrs. R. Sydenham, rom Mr A Hew Well Germania from Mr $\mathbf{A}$ Jones ; fancy, Romulus, from Mr. R. SYDENHAM.
Miscellaneous Exhibits were numerous and very fine. Mr. H. J. Jones, Ryecroft Nursery. Lewisham, had a central stand of Begoniss, admimbly arranged. Nezt in order of merit came Mr. W. Brreengead, Sale, with an extensive collection of Rerns; and Messrs. Kelway \& Son, Langport, with Gladioli and hardy flowers. Collections of hardy flowers came also from Mr. J. H. W HITE. Worcester: Messrs. Clibray \& Son, Altrincham; Mr. W. F. Guny, Olton, and Mr. A TELL Teamington Mr, H. FCKFORD, Wem, had a collection of Sur Pers. THowsoy \& Co bunches ollection of 8 weet Peas; Messrs. Themson $*$ Co., bunches Ilford, new Carnations; Mrs. W. SIDENHAM. Tamworth, a Ilford, new Carnations; Mrs. W. SYDEviaM, Tamworth, a ts ble of floral decorations composed of Violas, with standi
of fancy Pansies; and Mewre. EDWARDs \& Sos, Nnttall, Ed fancy Pansies; and Menara. En

## SOUTHAMPTON.

Aceust 3 and 5. -The show held on the above dates wae quita one of the best held by the Soathampton Royal Horticultural Society. Nut only were the aptcimen plants of extra quality, and the groaps arranged for ffect oplendid bat the cut lowers, frait and vegetables were all © qual to or beyond the average merit. The arrangementr, sa nasal here, were of perfect order, and great credit it due to Mr. Fuicge, the Hod Secretary.
Flasts.-For the beat ten eprcimen plants, Mr. CrPEER Chelter ham, whe diatinctly is: his collection wes good
throuphent, and it was well st'Red. M. J. Wilkirs, gre to
Lady Theodera Guest, Inwood Hou:e, Hentridge, Blandford, was a creditable erid.
Mr. Cyrter was again ist for six specimens with a collection similar in point of quality to the larger one ; Mr. Willus, Florist, Winchester Road, Shirley, Southampton, was a close ad, his plants showing moub cultural skilh. Prizes were offered to residents only in Hampahire for six pecimen plante, and Mr. N. Bandford. ge. to Mrs. Haselfoor,
Moor Hill, Bitterne, won lst boncurs with a very butisfactory colloction.
Still another clace was provided, for gardeners only. This clase was for six specimens, and Mr. T. Hall, $g$. to the Preaident, Sir S. Mortigue, Bart., M.P., South Stoaeham House, Southampton, worthily won let prize.
Ferns, in aix exotic varioties, were best shown by Mr. Peel, gr. to Mie TODD, Sidthorpe Lodge, Shirley, Southampton. Fachaias, Begonias, Pelargoniame, and Coleus made a bright display, the principal prize-winners being Mesirs. J. Wricox Blandford), Mitchell, gr. to J. WiLLIS FLEMiv(i, Erq. (Chilworth Manor), and Mr. J. HAL
Groups.-Miscellaneous plants arrangel for ffect in a space of 182 equare feet made a good dixplay, wveral excellent
groups baing set up. Mr. WILK somewhat easily won the premier award with a light arrangement of suitable plants about which there was not a semblance of crowding. Mr E. Cart, gr. to U. A. GILLETT, Eeq.. Fair Oaz Lodge, won lst prize, with a creditable collection of plante evenly disposed.

Fig. 32.- THE PATENT STAMFORD HOR
(sEE P. 162.)

Cut fowers. - These formed a prominent section of the show. Roaes were $\operatorname{sta}$ ged very creditably. Mears. Kermiss, WinLIaMs \& CO., Salisbury, won for both twenty-four and twelve blooms, with even, fsesh, and highly-coloured specimens Mr. Will TATLOB, Hampton, Middlese, was a good 2ad.
In the class for twelve blooms, restricted to gardenere, Mr. J. Weat, Br. to J. Wrasas Es. R., Korthlards, Salisbury, won lst place.

Stove and greenhonse flowers in a dozen trusees were beat shown by Mr. Herbart, gr. to Mrs. Marsinall, Crawley Court.

Herbaceous flowers were excellent.
For tw. ice distinct varieties, Mr. B. IADHAMs, fiorist, Shirley, easily secured the leading award with massive banches of choice kinds. Messrs. Kernes, William \& Co won for both Show and Pompon Dahlias ; and Mr. LadHams way similarly succeseful with Carnations and Picotees.
Table decorations, epergnes, and bouquets, were well repre sented. For the former, Mise Kate Golding won with creditably-arranged table; Mise HobBy, Padnell Road, creditably-arranged table; Mise HobBy, Padnell hoad Mise $\mathrm{B} \cap \mathrm{BBY}$; and the heat-arranged basket of flowers came Mise BOBBY; and the hest-arranged basket of fio
from Mise G. HARPER, Blighmount, Southampton.

Fruit and Vegetables were thoroughly well represented. For 2 collection of six varieties there were seven entries. Mr. H W. Wardi, gr. to the Earl of Radxor, Longford Castle, Salisbury, was an easy lot for a good all-round collection; Mr. Inglefeld, gr. to Sir J. Keter, Tedworth, Maribarough, 2ad. For three buaches of Black Hamburgh Grapes, Mr. J. Sanders
 tinctly ahead of all others: Mr. W. Mitcestur ind.

For three bunches of any other black ruriety, Mr. J. Halc won with fine examples of Madreafeld Court; Mr. gandebs 2nd, with sume variety. Mr. Mitchell had the Sambebs 2nd, With sume Variety. Mr. Mitcerel had the best Muscat or alozandra, Mr, WArD occupying ater, in a position with three tup
Mr. Pope, gr. to Earl of Cartapvox, Highclere Castle Newburs, woe for two buachee of any buck Grapa. The
ningle bunch class was well contested, Mr. Miverafll wiening for black, and Mr. Warn for white. Hardy fruit wa well staged by Mr. Wisir; Melons by Mr. WakD, aud Mr. E. L. Brows. Porlland House, Ealimbury: Peaches by Mr. ©. Hall. gr. to Lady Lovisa Asarvaion, Melchet Court, Hall, gr. to Lady Lovisa Ashruring, Kelchet Court,
Romsey; and Nectarines by Ms. Ingiefield.

For nine distinct varieties of reqetables, Mr. T. WILkims In premier award, closely followed by Mr. Pupte.
In the classes set apart for Mesars. Britun's and wism": prizes, Mr. Pope won both with rool produce, Mr. Whlikirs following. Other classes in this section were well flled.
Misc.llancous,-Mr. B. Lamsams had a remartably fine group of herbscous cut Howers. Messtn. E. Hillifa \& Bon, Winchester, had shrabs in pots, slao Apples, Pearn, and Cherries. as will aba good collection of frut an bunkets.
Mr. W. H. Rocitise, Red Lodge Nursery, Southampton, hed handsome group of ehrube in pote.
Mr. Dovglas, Bookham, Surrey, ahoice collectlon of hi ew Carnations.
Mr. J. Milen, hr. to F. Perxike, Feq., Purtsmood, Bonthampn, tro dozen dishes of hardy fruit

## 8T. NEOT'S HORTICULTORAL

AUGOST 5.-The thirty.firt exbibition of this Sciety was held on the above date, and while horticultare is pre-eminently to the fore, the schedule of prizes includen other subject interesting to country people, ach at honey, farm and market garden produce, poultry, \&c.
Plants.-In common with other societies there are fewer plants staged than formerly, but a lcial grower, Mr. G. Redman, gr. to J. H. GoodgamFs, Esq. Kynesbury, growe some ery good specimens, his six plant. in flower being attractive pecimens of Statice profusa, Bougainvillea glabra, Stephanotis floribunda, Anthurium Scherzerianum, Clerodendron fallax, and Hydrangea hortensis. Mr. Redman had the only group arranged for effect-a very good one.
Some rery good Balsams, much better than are usually seen, were ataged by Mesars. Benman and J. Jounson, St. Iven Tuberous Begonias were remarkably good, Mr. T. Lockie, gr, to A. J. Thormhill, Fiq.. Diddiogton Hall, taking the lst prize, and there were two equal 2nd prizes awarded. The best specimen flowering plant was 8tntice profusa, admirably bloomed, from Mr. T. Lockie.
In the way of foliaged pianta Mr. Redmax had the beat four ctove and greenhouse Ferns, staging fine specimens of Adiantums Williamsii and Collisii, a capital Platyceri um alcicorne, and Polypodium effusum. Coleus were represented by nicelygicwn bushes from Messrs. Last and Rrumas. The beat ornamental foliaged plant was a fine prece of rucca aloffolia, from Mr. Bedman ; the best specimen Fern, a grand piece of Nephrolepis exaltata, from Mr. Lockie. Many plants of e. creditable character were shown by amateurs.
Cut flowers.-Roses, usually a very good feature at this exhibition, were few, mainly owing to a violent hailotorm on Eunday evening. The bett twelve blooms came from Mr. J. Stone, Kr. to Mr. R. A. Cochrane, 8t. Neot'o. Mr. Recpcax had a fine stand of twenty-four busches of stove and greenboase cat flowars; and in the clase for twenty-four bunches of cut hardy herbaceous and bulbous flowers the Rev. W. Crouck, Gamlingay, staged one of the bast collections we have soan for some time past, comprising wo or three very fine and distinct Phioxes, Helianthus solei d'Or, Lilium tigrinum, Eryngium amethystinum, 8 tatio latifolia, a prend bunck of the white Everlating Pea. Alatroe meris urantiacs. Physostegia virginios, \&c, Very cood年hlise for the season were staged: also Stocke, Zinnias, Maricolds, \& The bent twive bunches of hard berbeceous flowers came from Mr. W. Last.
Fiucit. - The best collection of oight dinhes of fruit came from Mr. J. Mreas, The Gardeas, Hinchingbrook Eouse-Peaches Cherries. Figs, Melons, Apricota, kc., all good; Captain Duncombe being 2nd. Good Black Hamburgh Grafee came from Mesars. Moore, st. Neotis. Dessert and culinary Apples, desert and kitchen Plums, Cherries, Currants, \&c., were all good.
Vegetables. -The beat eight dishes came from Mr. T. Lockic ; Mr. Mrers being 2nd, both excelleat for the sesson. Mr. T. Clark. Huntingdon, had sir goor dishes of Potatos; Mr. Myers' six di-hes were only just inferior. Mr. Lockif, had a brace of perfect Royal Windsor Cucumbers. Vegetables geaerally were good throughout. The hard-working Secretary, Mr.W. Ratchelou's, is unwearied in his exertions on behalf of the Society.

NORTEAXPTON HORTICULTURAL. A veust 5 and 6. - The annual exhibition and lase was held on the above dates. That it is popalar exhibition there can be no doubt, and this was clearly seen in the keen competition in the cottapers clases, in which the productions were of the higheat degree of excellence. The large plant clases contained many excellent exhibits, the groups being particularly fine; cat Goweri were aleogood; but fruit, on the whole, was a little below the aversge. The arrangements were ably and efficiently managed by en enthaisatic commitsee and a bard working necretary.
Plants and Groups.-The largest plant class is that for twelve plants in an equal proportion of fluwering and toliage. Mr.J.CTPEEE, Queen's Nusperies, Cheltepham, alowed very
strongly, and won a creditable viotory. His bett examples were Enies obbata puppurea, a grand specimen nearly 5 feet acrose, profusely flowered and well coloured; another of E . Thomponi was evon larger but a littly thin, still a fine plant. Thomp Pilgeimi was well fowered, and was a fine plant; B Jugainrillea glabra and Stephanotis floribunda were alike good; rillea glabra and stephanotis flll coloured and quite fresh. Whits statice protastons were staged in C. Queen V'ictoria Two magnificent Crotons were staged in superbly coloured; and C. Sunset, both being 8 feet across and superbly coloured; whilst in the background was an immense plant of cer circinalis, finely developed, this being flanked on either side by two capital Kentia3. Mir. Finch, gr.
Roy, Corentry, came in a fairly good 2nd. and corering a space of 240 square feet, Mr. CypHee was well and corering a space of ane being most effeotive, and in good lst, the entire arrangement being gracaful specimen of taste. Thix rupicola, wit' long arching leaves. This plant was Phised sufficiently to introduce a mound or undergrowth of Orshidy and other choice flowering and foliage plants, whilat towards each corner, other and smaller morands were grouped with either an elogant Bamboo or a graceful Cocos as a cen to each, these again being surrounded with Orchids, \&c.
Between thiese and nearer the centre, were some welllowered Eumea elegans. No attempt was made to cover the ontire space, the fresh green grass appearing hert and there with an occasional well-flowered Orchid or a richly-coloured foliage plant. Mr. VAUSE, of Leamaington, was 2nd, with a good aroup in which the besteffect was concentrated in the costral part, the outer parts being somewhat weak.
In the smaller group class there was only one exhibit, bat in was deemed one that was worthy of the 1st prize.
Ror cirstove and greenhouse plants, open to the county only, the competition was good, but the exhibits on the whole were not more than satiofactory in quality. Mr. Copson, gr. to Mrs. PuIPPS, Collingtree Grange, was lat, his best exaccples being Achimenes longiflora major and Allamanda Readersoni ; Mr. J. C. Innt, gr. to W. H. Foster, Esq., Spratton Grange, 2 nd . some well-grown Ferns of moderate size were staged, the best eaming trom Mr. J. B. Palmer, Cliftonville: and the next best from Mr. Copsos. Zonal Pelargoniums were shown well, the plants of medium but useful size. Coleus and Fuchsiss were very good, and the table plants also.
Cit P.ewrenz-A splendid box of stove and greenhouse flowers was exhibited by Mr. VaOSE, of Leanaington, comprising sereral good bunches of Ericas, Ixoras, \&c.; the best tabledecorations coming also from the wame exhibitor.
Wortwenty-four single trusess of Roses in variety, Messrs: Thow Phakens ef Sons, Kingsthorpe Nurseriee, Northampton, were 1st, the finest bloums in a very freeh and bright box
 of Billaburgh. Meesre. J.
The Rer. Dri Krwg, Gwyton Rectory, waif list for twelve varieties of Tea-scented Roses, with- ervellent bloums - Marie Van. Houtte and Innocente Pirola being the best; Mears, Thos. Pemines \& Soif followed, Rev. Dr. Kire was again ist for 'tiwelve varieties of any sections in the amatears' class, fhowith an erea box of freab flowers.
For twitve bunches of hardy llowers, Mr. Cole, gr. to Earl Spacen, Althorpe, was capital list, with a well set-up box, the best being Tueca gloriosa and Lilium chalcedonicum; Mr Krichiccer, Courteen Hall, showed wall for the ind prize.
Mrs Xutohtley was lat for twelve bunches of stove or grewalowse flowers, Eucharis Mastersi and Begonis odorata bein : noticenble.
Therbist bouquet came from Missrs. Yarde \& Co.y Northampton, and Messrs. T. Fenalins \&os, the competition being very keen.

Bome capital Cockscombe were shown, and the best were from Mr. J. T. Fossey.
Frutt. -The best collection of vight hinds was staged by Mr. Qilman, gr. to the Eart ot Simbswiver, Iogestre, the exhibit b:ing of first-clas quality, Biakk Haubargh Grapes, Lord Napler Xectarines, Hale's Early Rumehes, and a good Queen Pine were his bent dishes; Mris. Coze, whotollowed, had gond 'Macat of Alexandria Grapee, the etrare hind of Nectarine, and Barrington Peaches.
In atlass for Black Grapes, Mri. C. Invs won the 1st prise with Black Hamburgh Grapes; the bineher were well finithed, and the berries large; Mr. Cupe followed with well. coloured Madretileld Court, berries rather emall.
For White Grapas, Mr. Jorlini, wr. to Viscouat Clifdes. Hol zenby House, was 1st with Muscats, fine in bunch and berry: Mr. Copsor being again 2nid.
Mr. 3. Cole was lst for a dish of Nectarises, showing very fine fruity of Pine apple; Mr. Copsos again followiug. For Pea hos Mr. Miller, \&r. to Sir E. Loyer, Whitleburf Lodge. was 1st. Other kinds of fruit were not shown in great numbers.
Fegttailes.-Mr. S. Cous had the best collection of twelve varieties, showing a remarkable selection; his best dishes were those of Autocrat Pea, Ailsa Craig Oaion, Praguell's Enhbition Beet; and Perfection Tomatos, both Celery and Carrots being alio excellent. Mr, Copsor was a capital 2nd. Mr, s. COLE wea again for nine kinds, ie which the best of these fouad in the larger class again predaminated; Mr. Kxigriviex in this instance being ?nd.
Mucellaneous Exhibit, were stag? by Mesman. Tens. Perrkins \& Sovi, who had tastefully made wreaths and an anchor, the ©nest new kinds of Sweet Peas (excellent), als) cut hardy flowers, 89 well as a group of Yucsa gloriose in flower, with Acers, Bc. Minrs. Jous Permins a Sox had highly coloured trie los Pelargoniumas, a good selection of eut Roses, two backets of the benatiful rariegated Saxifraga sarmentoes, two some grod, lants of Liliua wuratum:

## THE GARDENING IN HYDE PARK.

In come rempects one notices improvements-or, at least, pleasing changen-in the abject used in the beds in this park. It is not always the same, and it is the change made in thia way that alone make toler able the tastelens arrangement of beds which ekirt Park Lane. How delightfal all this might be revidered if laid out in some leas artificial manter and dwarf evergreen shrubs and deciduous flowering one were ased amongut the beds. What a wealth of material ready to hand is lying itte-in nureeries everywhere, which could be well employed in giving interest to the gardening here! There in too lavish a diaplay of colour on the amall area of turf-all gems, and no setting.

Commencing at Stanhope Gate and going north; we have a series of bede which were filled in early anmmer with Pannien, Sweet Williams; Dielytra, Aquilegia, Solomon's Seal, \&c. Some of them are utill in flower, being continuou-vince April and May. Aquilegia with a groundwork of Earl Beaconafield Pansy made a very pretty bed, as did a bed of Solomon's Seal, and a carpet of mixed Pansies. A bed of crimson Stock with a band of Pansies has been flowering for the past two months, and it till looking well.

Some of these early beds have been replaced by Fuchsias and large plant of Pelargoniame, which are now making a good show. These bed are backed up with groups of Palms, Bamboos, and Heliotropen, and have a picturesque look. At South Street gate, to the right and left of it, we come to nice groapt of Fachsias, the varietie uned being Mrs. Marshall, light, and Scarcity, dark.

In the next section of beds we have two planted with some large standard Fucheias, having a groundwork of Polox decusesta, which give promise of looking well at a later date. A bed planted with Roses has done well, but owing to the dry weather ite flowering period waa cut short, and it has been replaced with Erythrina Criata-galli, now coming into flower. Some good beds of Carnationa attract notice, showing their adaptability to thi form of garden embellishment. Amongat the varietie doing well were noted-Danger, s good crimson; Raby Caatle, pale pink; Queen of Beddern, a brighter pink; and the primrose-yellow Germsnia. Alice Ayres, a white with crimson edge, is doing well, bat in not no telling as the varieties just mentioned. Next comes a bed of Canterbury Bells, which have made a good show, and bid fair to make another very soon, being full of bad again; a pleasing effect is prodaced here by an undergrowth of Violas.
A bed of mixed Mimulus has been making a good show, but hat lately been removed and substituted with large plants of the oak-leaved Pelargoniam, having the Canary Creeper and Campanula pyramidalis mixed with them-a very effective asaciation.
Four beds of Ivy-leaved Pelargoniams having a carpet of Viola Blue Bell, with a band of white Lobelia, were remarkable for the pleaning colouring. Two bed of Hamea elegans were novel and attraetive. Humeat were once met with commonly, but gardenert have loat the art of growing the plante [owing to the diaease which affecte it. ED.], out they mut learn it again. Plumbago capentia with Solanum marginatum and Begonias as an undergrowth make a graceful bed planted together. Two mall bed filled with crimmon Stock and Migoonette, of courne always find admirern. Four round beds planted with taberous-rooted Begonias having crimson flowers, and atood about on a carpet of Moneywort, were attractive.

The next series of beds are planted in pairs, consisting of Fachaias, Bagonias, and Pelargoniums. The Fuchsia bed consist of the varietien Mre. Marshall, Empress of Germany, Madame Cornelissen, 3ud Scarcity, and some of them are carpeted with Ten-week Stockw, Begoniat, Violat, and other mallgrowing plants. Some bed of Pelargoniums, having miztaren of blue Cornflowers, Poppien, Golden Hrivet, and Scatice Sawarowii, \&c., ars very effective arrangement. On the left, going from

Mount Street Gate to Grosvenor Gate, there are some bed filled with French varieties of Canns which will make a good show later on. Two bed of Heliotrope, intermixed with Nicotiana affaia, look well. Here, again, we have a bed of Plumbago capensis and Fuchsia Scarcity, with Begonia semper. florent, and a carpet of Alternanthera, which loosed well.

From Gronvenor Gate to the Marble Arch noma of the bedis were filled in early apring with Dielyta and Pansies, and two bed of Doronicam planta. gineum, having mixed Tulip intersperned with the former, were excellent. Two bedr of Sazifraga ambroua (London Pride), with Spanish Iris inter mixed, made a good early thow; the Spanish Iria coming on later gave an additional floral diaplay. Trese beds have since been filled with Fachiu, Dracænas, Grevillean, Ivy-leaved Pelargoniums, \&cn and are again making a fine show. One bed of Petuniar mast not be passed over-it is fowering splendidly-the hot weather is doubtlens farourable to Pettinias flowering so well.

Passing across the park to the dell, we have the uanal imposing and tropical feature imparted by Tree Fernm, Dracrens, Musas, \&c., overhanging the pretty little atream of water at the east end of the Serpentine. A mixed border planted with thing too numerous to mention looks well at the premelt time. Coming on to the flower walk (Kensingtor Gardens), where flower have been continuou aince early spring, commencing with Snowdroph, Hyacinths, Tulips, Narcisaus, Chionodoza, Seillh, Phlox amœena, Wallflowers, Pæjnien, Lilien, Delphiniams, Viulas and Pansies, which latter are atill good, we have a walk prenenting daily frenh feature of beauty, interent, and attractivenem. $\Delta$ word of praise should certainly be given to Mr . W. Browne (the Superintendent) for hir admirable arrangemente this season. J. B.

## Scotland.

## AN EDINBURGH NURSERY.

To the lover of horticultare, who find himelf on holiday in the queenly capital of Scotland, not the least interesting of the many intereating features of Edinburgh is it profasion of magnificent publie gardens and extenaive private nurserien. Among the latter, Beechhill, owned by the well-known frm of John Downie, and aituated about a mile west of the city, on the Coratorphine Road, amply repays the trouble of a visit. The aituation of the Nurtery of itwelf has a pecaliar charm for the eye that can apprecista the beauties of a delightfal landecape in the envirote of a buny city. From the slopes of Beechbill yois might imagine yourself sarveying the ontlines of mome aqueatered acene, far from the turmoil of thousand basy streets, though the heights and apires of the Northern Athen are almost within a stone throw. In front atretches one of the most fertils plaing in Scotland, affording a particularly rice mosaic of cornfield and meadow, and backed by the green alopen of the diatant Pentlands. Oa the rigt lies the village of Corstorphine, with ite vanersb church-spire, and the wooded hill, whone sumaik "Rent and be thantfal," is one of the favoari haunte of the good folk of Ejiaburgh. To the let a glimpse is caught of Arthur's Seat, which you might miatake for the brow of some distant "Bis As I have said, you might be 100 miles removed fos the buay haunt of men, were it not that the 10 cloc gan booming from the Castle rock, acarcely halro th hour's walk away, reminds you that
near environs of "Edinboro' toun.
I bave not come here to reflect or poetise, how ever, and after mpending five minute admiring the prospect, I am conducted into the Begonis-houst there to marvel at the effect produced by the silife cooperation of Nature and man. The houre is between 80 and 90 feet long, and it mas conm some ides of the besuty of the interior when I wry that the long platform on either vide of a mifneat pasaage are covered with
blooms of exqaisite

The contents of the next honse into which I am conducted are less dazzling. It containa a fine collection of healthy Smilax and Hamea elegana. Ita neighbour, the Palm-atove, in filled with many thonands of graceful specimens, ranging in size from 3 inches ap to 12 feet; Gloxinias of the finest atrain, Eacharis, Adinatam caneatum, Arancaria excelan, Dracrens, Asparagus plamosus nanos, Caladiume, Cannas, and other saperior plants have each a house devoted to their culture, in order to supply the large demands of Downie's floral establishment in Princes Street.
The last honse inapected is reaplendent with a blase of double Begonian; nome of the blooms are truly magnifleent. I cannot refrain from mentioning one from a seedling of Downie's own nurtare. It bears the appropriate name of Mra. Downie, and for size, compactness, and the purity of its white coloar, would be difficalt to surpasi. Other apecimens deserving apecial mention are Madame Cecil Godfrey, Lamartine, and La Baronne de St. Didier, One is not aurprised to hear that thene blooms are at present the most popular of flowert with the fauhionables of Princes Street.
A atroll along the walke outride betrays at every atep rome intereating feature. A patch of healthy young Planes attract attention from the fact that they are the offspring of a venerable aire, which is one of the sights of the village of Corstorphine. This relic of a byegone age is the remnant of a ohady avenue that once led ap to the old castle. Both castle and avenue bave disappeared, and left this giant witnees of the old world of a far-off generation. The feature about it is the remarkable colour of the young leaves in early apring, their glittering yellow is so aingular as to atrike the eye of the most indifferent passer-by. The old folks tell a story of a phantom woman dressed in white, with a bloody aword in her hand, who affrights the belated traveller, a tale which recalla a love tragedy preserved by tradition.
Other bedethat tell of fouriehinggrowth and carefal management, and that cateb the oye in pasing, contain collections of Conifers, frait trees, ornamental shrabs, East Lothian Stocke, Antirrhinuma, Pentetemons, Delphiniums, and other herbaceous
flowers. It is flowers. It in anfficient to ayy that the whole is a model of what a plant-rearing garden thould be, and reflects credit on the general management of Mr.
William MacKinnon, Traveller. William MacKinnon. Traveller.

## Forestry.

## felling and planting park timber.

"Br aye atickin' in a trees" was the advice given by the laird of Dambiedyken to his son, and it is mid theme words of Sir Walter Scott led several estate proprietors to go in extensively for tree planting. However this may be, it is probable that the taste for planting has existed, and will exist, among all clases, independently of any ulterior motires than those ingrained in most membera of the human race, from the inmate of a garret with his or her Pelargoniam in a tes-pot, to the wealchy proprietor of a large eatste, with his wood and deer-park. With this taste for planting is amally aseociuted the desire to prenerve what hat already been planted by the owner or his predecestore, a sentiment which is constantly in evidence Wherever trees or shrabs are to be found. We sill know the angainly Arancaria of the auburban ville, Which the occupier thereof regards either as a type, of arboreal beanty, or as a vegetable phenomenon, according as his inclinations run in an artistic or acientific groove. Bat while such incongraities ar apparent to the most casual critic, cases may be constantily met with where the exiatence of a few trees blocks up or obatructis a pictaresque view, the poneibility of which has never been ounspected. Such canes are more common in undrlating than very flat or billy countries, but in all parte of the coantry the fanctions of trees in
the eomposition of the landreape eeldom receive a due amount of attention, although their planting is better attended to than their removal. Many of our most picturenque parke have, no doubt, been touched up by tome able landecape gardener at one time or another, and bear evidence of their skill to this day, for the artistic creation of such men as Repton, "Capability" Brown, Kent, \&c., ', are little more than fully developed even now. Bat while the art of the landscape-gardener bat not altered so far as ite principles go, nor has it advanced to any important degree during the last century, the ideas and productions of its followers are constantly in need of revicion and modification. This arises from the simple fact that trees grow in aize, while their surroundinge retain their original proportions. The seedling of an inch growa in the coarse of a century into a lofty tree, creating a new feature in a landncape which may or may not be the better for it. We often find a site chonen for a manaion on account of the extenaive view of the surrounding country which it commands, and where the immediate vicinity is bleak and bare nothing is more natural than the denire to remedy this defect by planting belta, clumpa and single trees in more or lens clone prozimity to the house. The effect of this work is at firt acarcely pereeptible, but later on, it is frequently found that some interesting feature of the landicape is shat out from the principal point of view. When this occurs before the trees have reached their full aize, the removal of the obstraction is a simple matter; but when, at frequently happent, many years elapse before the view becomes obstracted, a conflict often arises in the mind of the owner as to whether a well-shaped tree or clump of trees, or the view behind it or them, shall be sacrificed. To the landscape gardener or impartisl observer this question resolves itself into simply deciding whether the tree or the prospect behind in the greater feature in Vhew before him. "A Primrone by the river's brim, a yellow Primrose is to him, and it is nothing more;" but the owner nees things in a different light. Familiarity does not alwaye breed contempt, and the chiet attractions of a home lie in the faviliar objects by which it is sarrounded. Every tree, building, or hedgerow is necesaary to complete a picture which is always present to the native mind, and the removal of one of them is like parting with an old friend, or the anapping of a link which connecte the old with the new. To the stranger, things appear as they are, devoid of all asaociation, and every combination of lawn, trees, water, and eky, forms a picture, good or bad, as the case may be, and the landecape artiet walks through a park in much the wame way as a painter walke through a picture-gallery. These two independent points of view are naually brought into opposition when outaide opinion is conalted renpecting the improvement or alteration of any old and historic manaion or park which has been in the hands of toe owner's family for several generations. When a property changes hands, the new owner invariably sets about alterations and improvements, which the old proprietor would regard as atterly apoiling the place, but in most cases true tanto will content itself with as few radical changes an possible, and aroid any alterations which tend to destroy the general character of the apot. One of the mont ensential attribates of those who plant or fell for effect is the power of anticipating the reault of their work when fully completed. This is the more easy to do in the case of felling than in planting. as the fanction of the former is to remove exioting defecta, while that of the latter is rather to provide new features. The removal of trees may be desirable for stveral reacons, but apart from those canes in which they act as obatructions to the view, from a definite standpoint, the most monstrous instances are foond in the case of belte, margins of woods, and dense masess of trees which give the landscape a heary and somewhat monotonous appearance.
The belt is an element of most park scenery, and is uevally provided with the intention of hiding the bountary line, or disgaising the real limit of the park. This it often fails to do, owing to ith parrowness,
uniform width, or unbroken continuity. A narrow bolt is quite as effective in ita early lifo as a brond one, but as the trees grow ap, their lower branches die off or become thin in foliage, and wo find a parforated and imperfect acreen, the identity of which is only too appareat. By rarying the width, to that some places are dense and impenetrable to the eyo, and leaving a few gape in auitable places, it becomes almont impossible to detect the bonndary line at a reasonable distance, and relief is farnished to an otherwise long and unbroken surface of foliage. A common fault in a belt ie ita atraight or compatively atraight outline, often produced by following too closely the fence it is intended to hide. This can also be remedied by rarging the width, to that some part: project, and othert recede from the general line. The same treatment is necessary in the case of margins of woods, but where this has been neglected in planting, the aze muet be employed to break the outline where necessary. By catting sharply into the wood in one or two places, so that the outline becomes prominently but not too frequently broken, a variation in light and whade is obtained which greatly improven ita appearance.

A better effect in produced if the remaining portions are thinned, so that individanl trees atand out here and there from the main masn, and thas obscare the exact boundary line between wood and grass. This, of course, muat be done while the trees are atill young, otherwise the unfurnisbed condition of the lower part of the trunks gives them an unsightly appearance when isolated, and the sudden exposare may also sffect their health. In breaking a dense mase of trees anch as a large clump, the anme principles apply an in the former case. Instead of leaving single trees, however, it is better to lenve them in twos or threes if the lower branches have been killed off by crowding, which is better for the health of the trees, and also does away with a good deal of the unnightly appearance which inolated trees with bare stems present. As many of the rearginal trees should be retained as possible, as these will be well furniohed, and hide thone atanding behind to a great extent.
The manner in which planting should be carried out in a park depend greatly upon the conformation of the groand. Where the latter is of an undalating character, the differences of level may be apparently increased by planting the topa of alopes and hillocke, and leaving the low ground comparstively bare. Oa flat groand, recoarne mast be had to groupe and combinations in order to farnish variety, and thick planting uauslly gives a better effect than wide atretches of bare turf with nothing to attract the attention or form a zufficient background to the view. On anch groand fow finer effecte are obtained than by following the type of the natural forest, with its alternating glade, thicket, and characteristic group, and in which the acene is conatantly changing. Most of our finest parks are simply the remains of primeval forents, which at firat were reserved an chases or aporting grounde, and later on enclowed and atocked with deer. This asyle of acesery, however, can only be artificially obtained in parke of large extent, or in which the head of deer or cattle is kept within due limits. Close grazing improves the pastarage, no doubt, but dentroys the smaller planta and bushen which constitate a characteristic feature of forest acenery. This lack of amall ehrubs, Forns, \&cc., gives a prim and neat appearance to a park which is not altogether diepleasing, but is apt to destroy the perfectily nataral aspect which many consider a park ought to poseses. The jadicious use of the ha-ha or sank fence, and the planting of B ackthorn, Holly, \&sc., waich are secure from the attacks of cattie, might do mach in bresking the even planes of award below and the broweing line above.
The we of the clump in park acenery has often resalte in producing a bad effect. This is nanally dae to its being planted with circalar outline; and when, as is ofsen the case, it is treated throaghout an a plantation, it is entirely out of keeping with the surrounding ground. In our opinion, where more than half-i-dozen trices are winted in
one place the clumpshould never possess an entirely convex outline. Creacenta, triangles, and oblongs, \&c., are all preferable to the circle, providing the sides are not too etraight and regular; and a V Y, or atar-ahape, are all well adapted for providing a broken, irregalar outline, with alternating projections and recenses. Many of these objectionable circular clumps were probably planted with the intention of gaining the mont ground with the least length of fencing, and after the removal of the latter, giving the clump its final shape. Bat as this would naturally be out of the question antil many years after planting, it is not sarprising to find this part of the work neglected in many inatances where the planter has not arrvived the completion of his tank, and his anccenors have not entered into the spirit of his ideas. At the same time, the diafigurement of a picturenque park by these formal clampe of young Fir or Larch seems hardly jaatifiable uader any circumatances. Where young trees mant be planted for after-effect, and to replace deathn, a more appropriate way of doing it might marely be found, and the principles of atrict economy (so seldom observed in bond-fide plantations) alightly departed from when occsaion requires. By giving the clamp ite proper aize and shape from the first, the branches of marginal trees are allowed to develop, and the effect at all stages of growth is greatly improved.
Generally speaking, planting individual trees in the park does not prove a ancces. A single tree may be either an overgrown bush or an arboreal giant, but it is only as the latter that it in much admired. On poor soila, or where at all exposed, a really good apecimen tree is rarely seen, and the majority of ivolated deciduona trees are short boled with " manhroom" heads. In zach casen, a crown of foliage formed from two or three stems is ueually more admired than the formal looking individual. Too many double-atemmed crownt munt, of courre, be avoided, and the existance of any well-shaped tree, however amall, is always welcome. Combinatione of different opecies, sach an Scots Pine and Oak, Beech, Elm, \&ce, often give a pleasing effect, and a fow Thorns, Hollies, \&c., help to break the browaing line on flat groand. The chief object aimed at, whether in felling or planting, should be the providing of juut that amount of variety which prevente monotony but does not deatroy character. Abrapt changes, or a series of similar repatitions are always andesirable, the one attracting attention to their artificial nature, and the other proving far more monotonous than a constant, but charneteristic type of acenery. A. C. Forbes.

## Vartorum.

The Advance of Plant Life, -Whan the remendous volcanic explosion of August, 1883, occurred in the Straita of Sanda, half of the island of Krukatoa wat blown awsy and every veatige of life was destroyed on the remaining half. The ground was buried ander hot ashes and buraing pamicetone, varying in depth from 3 feet to neariv 200 feet. No vegetable marm could possibly have survived the catastrophe. Yet when Dr. Treab explored Krakatoa only three years after the eraption, he found varions apecies of plants flourishing there. It was ahown that they could not have been carried there by human agency, becaune men had not risited the devartated illand. The character of the new plants was ruch as to prove that they could not have been derived from the former vegetation of Krakatoa, even If any living remains of that vegetation could have exieted in the burned aud buried soil. The neareat land on which any nlante grew wat the island of Siberie。 Samatra in 20 miles and Java 21 miles from Krakatos. Yet a dozen kinds of Ferns and severs apecies of lowering plante and grames were discovered by Dr. Treab floarishing on the shores and in the mountsinous interior. That some of these forms of vegotation had been carried there by the ocean was indicated by the fact that neede of littoral planta
were found acattered on the shore. As to the other planta, the hirtory of their appearance apon the island neems to have been as followa: First, a thin film of a simple form of vegetable life, derived from floating germa, in the atmorphere, covered the pumicestone, and, through chemical action, brought its ansface into a condition fitted for the nouriahment of Ferns and later of flowering plants. The seeds of thene were brought by the wind and birds, and, as soon as the soil was capable of supporting them, they took root, and, bathed in the equatorial anahine, began the work of clothing the barren island anew. Renewed attention has recently been called to the reappearance of vegetation on Krakatoa in connection with the general sabject of the origin of the plants that inhabitiolands. Nature show herself entirely capable of conveying the germe of plant-life for long distances by meann of the ocean and the atmorphere, aided by the birds. When man comes to her assintance the work goen on apace. Of eighty apecien of plants inhabiting the Laccadive Islands-which are aimply the tope of a group of submerged mountain peaks in the Arabian Sea, half of whose inhabitants have at timea been awept off by storm waven-it is believed that fifty-nix have been introduced by man, eleven by the sea, two by the winds, and two by birds. Among the apecies not introduced by man is one of the finest trees of the islands, the Coco-Palm. There is nothing more impreasive in modern science than the story of what has been learned of the gradual conquest of the earth by plants-for a real conquest it has been. Christian Age, July 10.

## The Weather.

The term "acoumulated temperaturs" indicatea the aggregate amount, as well as the duration, of degrees of temperature above or below $42^{\circ}$ Fahr. for the period named : and this combined result is expreased in Dey-degrees-a "Day-degrea" signifying $1^{\circ}$ continued for iwenty-four hours, or any other number

The districte indicated by number in the firat collumn are the following:-
1, Scotland, F.; 2, England, N.Eroducing Districts-
4, Midland Connties; 5, England, ineluding London,
Princzoal Grazing, Ge, Districts- A . Scotland W.
Kngiaed, N.W. 8, Kngland, S.W.; 9, Iralaud, N.
10. Iroland, S.: Whannel Inlands.

THEPAST WREK
Tin following summary record of the weather throughout the British Ielands for the week onding Auguet 3, is furniehed from the Meteorological Office :

The wather was mostly fair and dry durine the early part of the weel, the only exception being on July 28 , when hesvy rain fell ower the eastern and woxthern counties. After the middle of the period, however, unsetthed rainy condition spreal gradually over the United Kingdom from the weet ward, and on August 2 smart thunderstorme ocecrred in many parts of England.

The temperature was below the mean in all districte, th deficit amounting in most cases to between $2^{\circ}$ and $3^{\circ}$, but in 'England, E.' to $4^{\circ}$. Highest raadings, which occurad various times during the week, were below $70^{\circ}$ in moot of th western and northern districts, and very little above that point in any other parts of the kingdom. Lowest reading were also registered on varying dates, and were low time of year; in 'England, $\boldsymbol{E}_{3}$.' the thermometer fell to and in 'Scotland, N. and W. and England, S.W.' to $38^{\circ}$. In the 'Channel Islands,' however, it did not go below $53^{\circ}$

The rainfall exceeded the mean in 'England, E. and s. and the Chaunel Islands, as well as in Ireland, N.,' bat shom a deficiency in all other districts. In 'England, Nor, ad N.W.' the fall amounted to only half the normal.

The bright sunshine was considerably less than the mom over the United Kingdom generally, but was slightly in ex of the normal in 'Scotland, E. and England, N.W.' The m centage of the possible duration ranged from ' 89 in ' Fng m , N.W.,' and 28 in 'England, E. and the Channel Islands,' 15 in 'England, N.E.,' and 14 in 'Ireland.

## MARKET8

COVENT GARDEN, August 8.
Wo cannot accept any responsibility for the subjoind reports. They are farnished to us regularly over Chursday, by the kindness of several of the prineip alesmen, who revise the list, and who are reaponsibit for the quotations. It must be remembered that the quotations do not represent the prices on any particalk day, but only the general averages for the weel proediug the date of our report. The prices depend apou the quality of the samples, the supply in the market, and the demand; and they may fluctuate, not only from day th day, but often several times in one dav. ED. 1

London Averages: August 7.-Hebrons, 80s. to 90s.; Soowdrope, 80s. to 100s.: Rarly Regents, 65s. to 75s.: Early Rose, 60s. to 70s.; Puritans, 60s. to 70s.; Kidneys, 60s, to Obs. per ton.

## CORN

Averages. - Official statement of the average prices of Britimh Com, imperial measure ( qr .), for the week ending August 3, and for the corresponding period last your: -1895 : Whent, 24s. 2d.; Barley, 18s. 2d.; Oats, 13s, 9d. 1894:

## HAY.

Averages. - The following are the averages of the prices at the principal metropolitan markets during the past week:Claver, prime, 90s. to 110s.; do. inforior, 50s. to 80 s. ; hay, best, 60 s. to 95 s. ; do ${ }_{2}$ inferior, 36 s . to 60 s ; ; mixture, 70s. to 92s.6d.; and atraw, 20s. to 38s. per lond.

## Vegetables.

## NEW KIDNEY BEAN DWARF PARISIEN.

This is a dwarf French variety distributed by Menars. Vilmorin \& Co. of Paris last apring, and it is said by them that it han sprung ap among the Paris market gardeners, and although it has become known but recently, ite culture is spreading very rapidly in the vicinity of Paris. I have a few lines of it at my seed grounds at Bedfont, where it has done well and pleasen me greatly. It is of dwarf and compact growth, very early, and highly productive, the poda long, soon mataring, dark green in colour, atreaked with black linea, and baving tested it for table, I can pronounce it all that can be deaired. The fact that the beane are darkly atriped need not prejudice any one againt it; it is characteristic of come older varietien, and the colour entirely diesppears in the process of cooking. I think it mant prove a very excellent foreing variety, an it commences to bear no early. We are indebted to Mesart. Vilmorin \& Co. for averal good thinge in the way of vegetable: not lenat among them being the Dwarf Parisien French Bean, R. $D_{\text {。 }}$

ENQUIRY.
"He that guestroneth much shall harn mench."-BaCOT.
D. W. C. M." would be glad if some of our correapondent would inform him what would be the bett chinga to grow on land irrigated with eewage.

- Owing to the large increase in our oirculation, 108 ar reluctantly under the necessity of goind to press some hours lindly aid us by sending their communioations as early in the roek as possible. Communications should reach us not later than Wedneadany.
*onding plants or fruits to be named, or asking guestions demanding time and ressarch for their solution, or asing questions to obtaln as annwer to thair onquivies ind, must not mppeca speohmens should be good omes, caremully pocked and mumbered. and not more than siac should be sent at one time. Leaves only, or Torists vamities cannot, as a rils, be named.
Address of the Gardenirs' Royal Benevolent Institution: Inquirer. No. 50, Parliament Street, Whitehall, W.C.
Books: Asparagus. A truatworthy manual is one entitled Asparagus Culture, by Barnes and Robinnon. Price 18. $8 \mathrm{~d} .$, post-free, of D. W. Morgan, 1, Little Coliege St. Westminater, London, S.W.Propagation and Management of Fruit, Forest Trees, Confres, \&c.: W. H. B. The following would be of use:-Fruit Farming for Profit, by G. Bunyard, published by Frederick Bunyard, 29, Week Street, Maidstone; Cultivated Plants, hy E. W. Burbidge, to be bought of D. W. Morgan, 1 Little College Street, Wentminater, S.W. : and The Art of Grafting and Budding, by Charles Baltot, pablished by W. Robinson, 37, Southampton Straet, Covent Garden. The Forester, by J. Brown, 6th edition, by John Nisbet, published by W. Blackwood \& Sonn, Edinburgh and London, will tell you all about the management of forest trees, \&c., in the nursery.
Carnation Propagation: R. M. P. You will find several methods described on p. 41, July 13. The steme should be cut half through, just below a joint at a point where the growth it fairly matured, but not woody.
Cocrscombs: $R . M, P$. The plant is an annual, and should be thrown away after flowering, if seed be not wanted.
Dracesnas: $\boldsymbol{A}, \boldsymbol{M}, P$. The stem thould be half cut througb just bolow a node, and then slit upwards for an inch or two, the slit being kept alightly open with a thin wedge. Mons may then be boand round the atem at that place, or a flower-pot cut in half vertically may be made to clasp the atem, being fixed to some stakes stuck into the soil, and fastened together with twine or wire. The pot may be filled with peaty moil, or peat and ephagnammose. The soil or mows should be kept moderately moist. Whensufficiently rooted, separate the rooted portion and treat it as an independent plant.
Rabwige on Nectarins Terms and Dahlias: E. B. G. and B. D. Theae insects (Forficala auricularis) may be caught in amall pote halfflled with hay, \&c.; in lobster-clawt, or, better till, in tuben made out of brown paper, pieces of the ateme of Hemlock, Elder, and Broad Beane, one end being plagged. These should be cut into lengthe of about 9 inches. In the caee of Dablias, Carnations, \&c., hang the sube on the atake that mapporta the plant, the open end downwarde. In the morning, take down the tubes, remove the plag, and blow the earwiga into a vensel of hot water, replace the plug, and hang it again on the stake. In the case of fruit trees on walls, the tabes may be tucked under the shoots and branches.
Fertilisation of Orchids: F. L. G. The Hayue, John Marray, Albemarle Street, London. A few thillinga.
Fovar: T. J. H. The fungi you nend are true Munhroome.
Fungus Disrasks of Tomatos: Solanum. Bat little good would renult from putting in your inquiry concerning thewe two well-known maladies. As a preventive meana, use the Bordeaux Mixturea formula for making it was given in a recent isne-not waiting till the disesse has declared itelf. It will not harm either the fruit or the leaves, and it will keep the plant healthy. Take care not to use it after the fraits begin to colour.
Labye: W. Cann. None wat found in the box.
Licies: F. de L. The Liliez you mention might all be left in the ground if anficiently protected. Your plants of L. auratam are probably attacked by the fungus which is eo destructive to Lilien.

Mushroom orowivg on Glass without Manuaz: W. H. P. See Gardeners' Chromicle, Augat 19. 1893, p. 214. We have no farther information.
Nambs of Frutt: J. W. S. Keawick Codlin,-A. F. Pear Early Roustelet; Apple next week.
Namns or Plants: Correspondents not answered in this isnus are requested to coniult the next number. $-B . P$. We do not undertake to name floriata varieties. Send your Carnatione to a large grower -A. F. 1, Capreseas, perhaps semperviren: 2, Libocedrue decarren: 3, Liquidambar atyraciflus: 4. Pinue Laricio var. ; 5 and 6, next week. -F.C. S. Spirsal Lindleyana, and one of the American Oaks. -W. T., Leiovetor. 1, Sedum ; 2, Anchaen italica; 3, 4, and 5, Erinas ivchaidea-J.C. 1, Viola cornuta, white variety; 2 , Geran um pratense ; 3, Melilotua; 4. Sedum rupeatre; 5, Linaria Cymbalaria; detached lanaen, without a number, Alchemille valgaris.J. W. 3, Thaya plicata; 4, Capresaus nutkaenaie; 5 , Rhas Cotinus. It is too risky to attempt to name the other acraps.-H. H. Coologyne speciona, Cattleya Eldorado. The little "Angrecam-like plant" is Trichocentram albo-parpareum.-J. S., Montrose. 1, Lastrea filix-mas; 2, Cyrtomium caryotideum; 3, Platyloma rotundifolium ; 4, Polyatichum angulare depauperatum; 2 and 3 are not British.-W.J. R. The rose-coloured flower is Laelio-Cattleya $\times$ elegans, commonly known as Lsolia elegans Turneri. The light one, LatioCattleya $\times$ Schilleriana. Both are natural hybrida, occasionally imported with Lalia parpurata. D. S. \& Son. Capressus Lawnoniana var, - C. Lincoln. Asclepias syriaca.
Small Fruits prom Nethand: T. Coomber. Uncommonly fine fraite of red-fraited Carrants, Cherry-red, and La Fertile; Ogden'a Black and White Datch Carrants; Induatry Gooseberries, and Superlative Raspberries. We have seldom seen finer, and the more remarkable from the fact that no artificial watering was performed.
Sfotted Paches: J. A. The apote are not cauned by any fangus growth. Cannot auggeat the canse.
Tomato Fruits not Colouring Properlz: H. Leb. There is no disease present in the fruit sent for examination, which in not in any way the worne for eating. $G . M$.
Tomatos: Challenger. The constitaente of atable and farmyard manure are, with the exception of the urine, too slow in their action to anit the shortlived Tomato plant; something more concentrated and readily arailable is required, and your plante are languishing for lack of it. Dang is particularly wanting in one important constituent cf the plant, viz., potsah. You muat clear way the topdressing of dang without much root-distarbance, affording alight top-dreseing of rather adhenive loam instead, and over this atrew guano, or a manare conaisting of nitrate of eoda or aulphate of ammonia, together with potash and phosphoric acid. If you ase manares rich in nitrogen and potash, but without the phosporic acid, the ripening of the crop will be retarded. The amount of manare afforded need not exceed 200 , to the equare yard, whether afforded in a dry or liquid atate; and it will not be required more frequently, at least until the foliage and crop have incresed, than once week. Ae againut the mildew, ane the Bordeanx Mixture; see answer in this page under the heading "Fungu" Diseasen of Tomatos."
Worms on Lawhs: W. E. R. Watering the turf with clear lime-water will bring them to the arface, when they can be gatbered up. This proceediag will reduce their numbera, but we cannot i vagine a lawa in good condition without worme, is they render it dryer by their barrowinga, besides boing the means of bringing the subsoil to the top, and thas helping to manure the turf.

Comhumications Reorived. - H. Noble, -A. C. F.-E. B.O. Thomas.-M. C.-T. Singleton, Curraghmore, next week; kindly send the promisert note on Cabbages.-W. H. A. Harrison Weir,-A. D.-W. H. Gardeners and others Wanting Stitations. 26 words, including name and address, 18. 6d., and 6d. for overy additional line (about nine words) or part of a line. These Advertisements must be prepaid. This scale does not apply to announcements of Vacant Situations, which are charged at the ordinary scale.
Births, Deaths, and Marriages, 5s. each insertion.
Notios to Advertisers. - In many instances Remittances in Payment of Repeat Advertisements are received without name, address, or anything beyond the postmark on envelope by which to identify the sender; this in all cases causes a very great deal of trouble, and frequently the sender cannot be identified at all. Advertisers are requested when Remitting to give their Names and Addresses, and also a Reference to the Advertisements which they wish repeated.
Position.-Advertisers are specially requested to note, that under no circumstances whatever can any particular position be guaranteed for advertisements occupying less space than an entire column.
Pobtal Orders.-To Advertisers, Subscribers, and Others.-It is very important in remitting by Postal Order that it should be filled in payable at GREAT QUEEN STREET, London, W.C., to A. G. Mirtiv, as, unless the number of a Postal Order is known, and it has been made payable at a particular office, and to a particular person, it is impossible to prevent any person into whose hands it may fall from negotiating it.
N.B.-The best and safest means of Remitting is by POST-OFFICE MONEY ORDER.
Adverticements for the current week must reach the Office by first post, Thursday morning.
all Advertiaemonts abould be madreased to the

BOTANY AND GARDENING AT harvard university.
$\mathrm{E}^{\text {VERYoNE interested in Botany and Horti- }}$ calture must have heard of the famous room in the Botanioal Museum at Harvard University, where the glass flowers are preserved. These models, whioh have been mannfactared in Germany by a man and his son, named Blasohka, are composed almost entirely of glass. The oolour is very largely in the glass itself, although some is placed on after the flowers are made. Where possible, the entire plant is reproduoed life-size; in other oases a branoh or a leaf and the flower cluster. The beanty and accuracy of these models are beyoud belief, and in some oases it is difficalt to distiuguish between the models and living specimens, when they are placed side by side. Quite recentls an Amerioan contemporary gave a short review of the botanical work at Harvard, from which it may be interesting to extract a few details. In 1842 Ass Gray was chosen Professor of Botany at Harvard University, and he soon set to work to improve the Botanio Garden. Ass Gray, it was anid, did more than anyone else to introduce the laboratory method in botanioal teaching. With him the stady of Nature mesnt oontact with Nature, and not what someone else had written about that contact. In 1873 Dr. Gray renigned his profeseorship, and one of his two assistants, George Linooln Goodale, was sppointed in his stead. The other, William Gibson Farlow, a few years later took oharge of the work in oryptogamio botany.

At the present time the herbarium of phane. rogams is looated in the building at the Botanic Garden. A curator and two assistants are engaged upon the study of collections which are constantly being acquired. The Botanic Garden consists of 7 acres of ground tastefully laid out into beds. In these beds there are plants of 1500 native species, 1300 foreign species, and 400 varieties. In the greenhouses there are under cultivation about 2400 species and varieties. The arboretum is at Jamaica Plain, about 7 miles from Cambridge. It oovers about 230 acres. By an arrangement with the city of Boston, this has been made a part of the metropolitan park system. The plan is to oultivate every speoies of tree and shrab which is oapable of withstanding the severity of a New England winter. How well the Direotor has suoceeded is attested by the fact that the Harvard or Arnold Arboretum, as it is called, is universally recognised as the finest in the world. The Arnold Arboretum has become one of the most charming places for certain studies of a general nature within reach of the public of Boston.

The Botanical Museum at Harvard consists of a collection of economio plants containing practically all the prodacts used by man. It is interesting to note that New York will soon be in possession of a botenic garden of the first
order. The subseription pre-requisite to the issue of manicipal bonds has now been oompleted, and it now only remains for the city to carry out its part of the agreement, by raising 500,000 dols. for building parposes, and by providing 250 acres of land in Bronx Park or other saitable place. It is hoped that other cities will soon follow the example of New York by enriohing their park systems with an educational aid of the greatest value. Mr. G. L. Goodale, of Harvard University, in an article contributed the other day to Science, put very clearly the uses of botanic gardens. Formerly, they were largely used for the oultivation of medioinal plants and for the reception of species from distant lands. Now new phases of plant relations are being displayed in the larger botanio gardens. Geographioal questions are asked and answered by skilful groupings of species. The bearing of olimate on the struoture, habit, and possibilities of plants is made prominent in an interesting fashion.

In fact there are numerous stimulating sights in a botanic garden if one only takes the trouble to look for them. We so often regard our American cousins as absorbed in the business of making dollars, that it is refreshing to find that they do not forget those higher pleasures which appeal to the intellect. The effect of the numerous Universities is beginning to be felt, and many young men are throwing themselves into some stady instead of entering business and bowing down before the almighty dollar. It has been well said that as a means of mental discipline, as a souroe of knowledge becoming more useful each year, and as a stady leading us closer and oloser to the just appreciation of Nature and her laws, Botany is unrivalled. H. C. F.

## New or Noteworthy Plants.

## CATTLEYA FOWLERI $\times$ **

This is a very beautifal hybrid out of Cattleya Leopoldi, fertilised by the pollen of Cattleya Hardyana. The new plant has a rather slender habit. The bulbe are slightly compressed, with only a trace of ribs when young, the elder one being aomewhat, but not even deeply farrowed. The raceme of the two first flowering specimens bore two flowers, but it is to be hoped the plants will become more vigorous, and then the number of the flowers will undoubtedly increase. The flowers are in size very similar to thone of Cattleya Hardyana, and from its father the plant has received the aplendid labellum. The colour of the sepals and the larger and more tender petals are deep mauve-purple, whilot the middle lobe of it shown the most intense violetpurple. This new hybrid was raised by Mr. Maynard in the entablishment of Menrw. Sander \& $\mathrm{CO}_{\mathrm{o}}$, at St. Albans. It is named in honour of G. Garney Fowler, Enq., Glebelands, Soath Woodford, Eveex, and wan shown at the Royal Horticnltaral Society on Tuenday last.

## VARIETIES OF STRAWBERRIES and new varieties for forcing.

Trose who force the Strawberry in quantity and early, are always on the lookoat for new varieties which have the property of atting well and are naturally early fruiters. My reader will not aup-

[^11]pone that I underrate the value of any variety not noticed in this note, for the Strawberry varies so much in different soils, and the variety that in a favourite with some gardeners is of small value to othera. Take, for instance, Vicomtesse Héricart de Thary, a popular forcing variety; some persons object to it as being too small, and prefer a larger-fruited variety as having a better appearance, good flavour in so many cases being reckoned only of secondary value. The introduction of novelties and the favouring of old varieties of poor quality have to some extent caused the decline in public estimation of good forcers, viz, Black Prince, King of the Earlies, and others of mall size noted for their good Alavour. To show the interest gardeners take in this matter, it may be stated that three new varieties have been certificated this season, all of which were noted for heavy bearing, size, and general good appearance. The raising of new early varietien does not neem until recently to have kept pace with the demand, and numbers of the standard varieties have been in gardens for a long time. Mr. Laxton's variety Noble, brought out in 1887, was a great gain ae an early fruit out of doors and for forcing. It is one of the most valuable varieties ever sent out, on account of its habit, which is vigorous, heavy cropping, and large fruit. I admit it has been condemned on acconnt of its lack of flavoar, bat atill it is one of the beat early fraits ever raised, and we may, on that account, overlook the defect. The well known Keen's Seedling, a variety raised in this district an long ago as 1821, is a grand forcing Stramberry, but there are aparions varieties of it about. The original Keen's in a dwarf free-fruiting plant, and it map atill be classed as one of our best forcers, and I force 1000 plants of it every year, having, as I believe, the true variety. The finest flavoured Strawberry in Myatt's British Queen, raised in 1840, and it is even now one of the best for late forcing, although I am fain to admit that in Laxton'n "Latest of All" we have itn auperior as regarda cropping, nize, and quality; and though I cannot nay that it in good for foreing purposes, it is so as the latest cropper in the open. I was very pleased with it when forced, the quality of the fruit being all that one could wish, the only drawback being that a few of its fruits failed to ripen at the point, having therefore the ame peculiarity as British Queen, one of its parents.
To come to what may be termed the latest addition to the forcera, and one that has made rapid advances in growers' estimation in a short time, Royal Sovereign, which, I think, will be a standard variety in gardens for a long time to corae. In this variety there are size, quality, and great cropping capacity-three ensential qualities of a forcing fruit. As an earnest of my appreciation of it, I may atate that on July 29 we potted up a thonsand plants. There are Strawberries with larger fruitn than thin one, viz., Auguste Nicaise, which has no equal in cropping and flavour. Even when hard forced, it does not lack alavour as others do. Ont-of-doors in our porous soil it was very fine this year, and only three weeke later than Noble, which is one of its parenta. It has got the wonderfal vigour of the latter with the flavour of King of the Earlien-that is, a briak Pine-favour. It is excellent for early forcing, setting freely, the fraits well above the foliage, not low down among the leaf-ntalkn. As a frait for sending long distances, it is one of the beat, the pulp being firm in textare, well covered with needs. Its colour is a bright acarlet, making a choice frait for early apring.
Another new variety, and one which nhould be noted on account of its excellence as a forcer, is Stevens' Wonder, a variety which has been figared and described in these pages, noted for its wonderful cropping qualities early in the meanon. This I am only able to describe from seeing it in frait, not having grown it, but I am going to. try it for very early fruiting, and I have some planta well-rooted in the fruiting pots.
For mid-neason forcing, the new Gunton Park in very good. It is one of the trio raised by Mr. Allan, of Ganton Park, and noted for their fine flavour, The fruita are large, dark crimoon in colour, of a
briak, pleasant flavour, and a good forcer for the seamon named.

There are others, such am Competitor, a fine fruit, with firm flesh, and though not recommended generally for forcing, I have found it to be good; not, perhapy, saitable for hard forcing.
This year two othera noted for their aize have come to the front, Leader and Monarch; the first is a grand froit, of good quality, but the plant cannot be recommended for hard forcing. Monarch is equally fine, with Pine-flavour, and it promises well; and though I have not yet grown it, it should not bs left out of a list of new varieties.
With regard to the forcing qualities of any varnety, much depend on caltural treatment, and whether the forcing is early or not, on the means for forcing, renalts obtained being different with different growern. I will admit that I have a partiality for some of the old varieties, and so far my best early has been Vicomtesse, which is excellent as a firt early, being very productive, free-setting, and of the beat flavour. But one cannot force both old and new in quantity, and when the newer ones have bsen tested, nome of the older kinds are allowed to drop. Vicomtense H. de Thary (Garibaldi) has been nearly fifty years in gardens, so it has atood the test of time; and after trying Royal Sovereign for three yeare, we are growing less Vicomtesue, the new one having aize, in which the older variety is lacking. My next selection is La Grosse Suciée, a very fine Strawberry of the Keen's Seedling type, not a good traveller, but prolific, and of good quality; indeed, an regards crop, it may be clamed as the best of the older forcing varieties. It beara a quantity of evensized fruit, and soon tarns in after setting. Many gardeners look upon this as being superior to all othert. It does well in mont soils, but I find it does not like too mach exposure in winter, the leaves soon gettivg crippled. Prenident and Sir C. Napier are too well known to need anything being said about them. The firat is liable to mildew, but it deserven attention, and thin pest may readily be checked.
I am aware many gardeners are not in a ponition to grow many varietien, neither do I advise it, a he new onen in any case will only be grown aparingly at first, and one can readily have Strawberries from February till June with a variety for each month, and my selection would be Vicomteme or Royal Sovereign, followed by La Grosse Sucité, or elise the true Keen's Seedling, President, and Sir Charter Napier. It is not advieable to have great numbers of late Strawberries in pots in a season like the one we have just passed through, as fruit in the open can be had early in Jane. Again, British Queen does not thrive everywhere, and Keen's Seedling is apt to come barren. Some varieties do not thrive in certain soils, and in such the novelties should be tried. So far I have not known Noble to fail, and fruits ripened in a well-ventilated house are very apperior. Hard forcing is often eolely at fault. A fow worde as to culture at thim season. The plants should now be in the fraiting-pots, and those who care to purchase mall-rooted, potted-up plants, will be in ${ }^{8}$ better position if they get them early. To obtain runners in quantity for next neason, I am planting now, at $2 \frac{1}{4}$ feet apart between the rown, and hall that distance in the row, in deeply-worked, wellmanured land, a row of Lettuce or late Colemort being planted between the Strawberries, groand being acarce. Thene are cut by March. When growth commencer, the flower-spikes are kept pinched of a they appear, and early runner-formation oncouraged, the ranners being fit to pot ap macb earlier thand when the plants are allowed to frait. A'ter tho runners are taken, every other plant is cut out with a hoe, nome more nutriment afforded, and forked in, and the beda made neat for the antuma. The plant frait grandly the following seasoo, then being deatroyed, 8 I 2 m a great advocate for young plants. In potting, avoid excess of manure, and use good loam, a aprinkling of bone-meal, or apent Muehroom manure. Firm potting, a hard coal alit bottom to atand the pote on, and plenty of sun, are essential points. The crown may be thinned whes growth is robast, and the roote should be protected
in winter. The best winter protection in afforded by cold frames, the plants being bedded in cocoa-natfibre or coal-anes. G. Wythes.

## DISA GRANDIFLORA, ETC., AT <br> - "JOLDW YNDS."

A pleasantly ituated garden is Joldwynds, the renidence of Lady Bowman, neatling on the south nide of a hill near the pretty village of Holmbary St. Mary, about seven miles from Dorking. The visitor on entering the groand will not fail, if he be an arboriculturist, to admire the fine specimen Bamboon
minently, were large beds of brilliant-coloured Cannar. The white and pink Malope (Malva) grandifiora is planted thickly on each nide of a long walk; also vigorout plants of the dark-blue-flowered Primula resembling Alice Wilson, which at the present time is a carce plant. Benide these there were large mases of Crinum Moorei, whose large pink and white corymb of flowers have a atately appearance.

## The Orchids.

In the plant-atove a robust specimen of Dendrobiam Dalhousieanum was noted remarkable for the size and abatance of its growths, which are many-
specimen of Maxillaria venuti, with over thirty flower-spikes; besiden a strong plant of Mormoden pardinum unicolor, with two atrong epike of its lemon-yellow flowers. In a cooler house, some fine pecimens of Madevallia Schlimii and Odontoglossum cordatum were noted, also in bloom Corlogyne occellata, Anguloa Clowesii, Dendrobiam Jamenianum, Lycaste Skinneri, and Madevallia periaseria. The cool-growing Pleione humilif, planted in thallow pans and hang close to the roof, appear to be suited with their position. In a moint bady corner of the house a healthy batch of Pinguicula caudata wan observed. Pasting along into a Peach-house is a

Fig. 33.-abundinaria nitida in the bamboo garden at few. (see p. 186.)
(not the least affected by the severe froste of last winter), the masaive Gunneras, several fine plants of Veronica Andernoni, which at the time of my visit Were full of flower, and the large bede and manees of Rhododendron plants. Having aecured the gaidance of Mr. F. Cornith, the head gardener, a stroll was taken round the very beatiful flower garden, whence \& view is obtained over a lovely country, the view extending almost to the Englinh Channel, and only divided from it by a range of the Sussex bills.

Of rare, or at least, uncommon plants, two fine buabe of Desfontainia spinona were noted; the gay and beautiful Tropaolum apecioum, entwining itself around Fir and Holly treen in great luxariance. Fine clump of Iria grow thiclly around amall lake, and in full bloom amonget other wat I. Douglanii. Not far diotant, and standing out pro-
nome of them meararing more than 7 feet in length, the young nteme now growing freely, indicate that they will eventually reach an far. A plant of D. Dearei wat in bloom, and growing well; D. chryeanthum will be a pretty sight a few weeks hence; D. thyrniffornm, D. densiforum, D. superbient, D. formonum and $D$. heterocarpum are doing well. These plante are hang from the roof, where they get plenty of sunshinc. The plants of Coologyne cristata, Phaius, Pleioner, and the deciduon Calanthes give good promise of a fine diaplay of bloom in their season. Suspended from the roof in the intermediatehouse some well-bloomed plants of Epidendrum vitellinum majus, and a nice healthy apecimen of Epidendrum Parkinoonianam, with eleven of it weet-mcented flowern were remarked. Standing apon the atage in the mame houne wan a compact
remarkable apecimen of Iris Robinooniana in the beat of health, but Mr. Cornith hae not jet nacceeded in flowering the plant.
Another mall houne is almost entirely devoted to the cultivation of Streptocarpus, of which at the present time there in a large quantity of young seedlinge in bloom, many of them of aterling merit.
Seldom is that beantiful terrestrial Orchid, Disa grandilora, seen so near to perfection under cultivation athere. At the present time there are over a haodred spike in full bloom, a sight that ip, we dare to ny , unique in this country. Tte loxariance of the growth, and the large atrong flower-ppike, how that the condition are very farourable. It may be atated that Mr. Cornish success with thi plant is not temporary, it being now many yeara aince he received hia firat few
plants at the Joldwynds, and it has been rapidly increased until at the present time the plants may be counted by the hundred. I have aeen the Disas for several years paat noted how well they are being grown here, and I hope the saccens attending their cultivation will long continue. Succese may in great meneure be attributed to a cool evenly-balanced atmonphere, ahade from atrong sunshine, wellventilated house facing south, and the temperatare of which in the winter frequently falling to $45^{\circ}$. The compost in which the Disas are grown connista of good black fibroun peat, and chopped live of gagnum-monn, with the addition of a small quantity of coarse silver-and.
A nice healtay specimen of the rare Gerbera Jamesoni, also South African, grows and flowers annually ander aimilar treatment to that afforded to the Diass. W. H. W.

## PRESERVING FRUIT.

I Hate read your article, p. 92, on thit popular aubject with much interest, and as lectarer on technical edacation I find few or no antjects more fraitfal of saggentive quentions. Neither does the British practice of fruit preserving as thas illastrated and elucidated differ very widely from the American as aet forth by Miss Parloe in the Gardonera' Chronicle of Anguast 3, and through other sources. As many doabtful and even faulty methode of fruit preserving, however, still prevail, you have rendered an important service to our rural indnatries by giving Mins Parloe's lacil lectare the wide pablicity of your columns. The prizes now so generally given for jamo, jellies, preserves, picklea, bottled and candied fruit, at cottagern' and other shows, exhibit at once the virtuen and merits of our present modes of preserving frait. The chief point wanting in many of these exhibites is some ware and certain object-lenson or sandard of merit to which to appear or compare the local exhibita. Not a few of the latter are dreary failures in colour-quality keeping quantitien. With the exception of Raspberriea, it would often be difflcult or imposible to tell at aight what fruit the preserves are made of the whole are also an a rule aeriounly over-sugared and over-cooked.
The pace of improvement might be greatly quickened as well as improved were an object-lemon exhibited at village or other shows in the form of ample jara or bottles of preserves, pickled or canned fruits and vegetables from such makers as Crous \& Blackwell, Chivers \& Sons, and others. Almost every housewife prides hareelf on her jellies, her jamp, picklen, green and preserved fruits. Nevertheleas, it is comparatively rare that these come ap to trade atandards of excelleney; and could thill be generally reached, the rural districte would be the richer in consequence.

As I note the honoured name of Mr. J. J. Willis, Harpenden, ander Mies Parloe's lectare, I presume that will be acceptod as aatisfactory authority of the coundness of the chemistry involved in the theory and practice of fruit preserving proponnded by Mise Parloe. One of the moet prevalent notions is, that fruit can hardly be over-cooked. The longer it is boiled in the augar, the longer and sounder it will keep, has almost paosed into an axiom among housewives and housekeeperi. Boiling expels the watery juices, makea jelly and jam more thick and denne. The more dense the more sugar and wolid matter, and the longer the eweeta will keep. Yee, but pectine, which forme the bsais of vegetable jellies, and gives to the juices of the fruita the property of gelatinising, may be boiled down into common gam or atarch by excese of cooking. Hence there is a tide in the affairs of jelly-making which leads on to fortane, that is, long, soand, and sweet-keeping, and that is when the property of gelatinising is at its atrongest, which will probsbly be found to be after a smart boil of a quarter-of-an-hour or twenty minutes. Will Mr. Wilis confer another favour to the many he hae already bestowed uponer caltivatora by laying dowa a time meaoure for the development
of the maximam properties of the gelatinising of frait in the process of preserving them? Practically most of ue are familiar enongh with the aimple test $0^{\circ}$ setting our jams and jellies on plates to wee if they are done. Bat acientific time formulas, so as to ensure sound keeping, without any risk of boiling fruit down towardn decomponition, would be very valuable. Mr. Willis will excuse me for asking for farther information about the use of lemon-jaice to keep fruit white after paring.
In regard to an-cooked Strawberries (p. 93), after many yeara experience of growing and preserving there fruita, my advice would be emphatically, do not follow Mis Parloe in this. Of course, the lecturer is writing on American munshine. With our watery uns, I can conceive of no more likely proceas to fill Strawberry jam with fungoid germe that would haten it into worthlennens and shear rottenness, although it has been previoualy fortified with a pound of augar to a pound of berrien, and boiled for ten minutes. Unless Mr. Willis has something to asy in explanation of the following paragraph, I hope no English jam makers will be tempted to try Mise Parloe's sunbath on this aide of the Atlantic.

Thin, however, is almont the only paragraph in this very urfal lecture that may not be read, marked, learned, and inwardly digeated with pleasure and profit on this side of the water: "San-cooked Straw-berrien.-Use ripe and the finest fruits; put them in the preserving kettle with a pound of augar to one pound of berries, firtit a layer of frait, then a layer of agar, and so on. Do not have the mixtare more than 6 inchen deep; place on the fire, and watch. When the preserve begins to boil, shim carefally, and nimmer for ten minutes. Now pour the frait into meat platters, and place in the sun. After an exposure to the sun for twenty-four hoars put ap in jars or tumblera, and cover. It may be said the aun does not shine for twenty-four hours, but the fruit may be placed on tables by the windows in a sunny room, and let it remain there for meveral days or until it has had ite fall sanbath." I repeat, do not. D. T. Fish, Leoturer on Technical Education.

## Orchid Notes and Gleanings.

## CATTLEYA VELUTINA.

This is one of the prettiest of its clase, and still uncommon in gardens. It was first flowered by Joseph Broome, Etq., now of Sanny Hill, Llandudno, who then caltivated hir Orchida at Didabary, Manchester. It was supposed by Reichenbach to be a natural hybrid between C . bicolor and C gattata, but there appears to be little to support that theory. A very fine example of it comes from H. Brittan Evans, Esq., Pembroke Road, Clifton. The sepala and petale are Indian yellow, apotted with cheatnutred. The bate of the lip beneath the column is rich gellow, with come parple lines running into the white nide lobes. The blade of the lip is white, with delicate rose veining. All the segmenta curl backwarde when the flower is mature, which gives it a striking appearance; they are almo delicately fragrant.

## Cattlifa granulosa.

Several remarkable varieties showing extraordinary variation have been sent daring the lat few days. The ahowier is C. granulons gigantea, sent for the second time by Mr. F.W. Moore, Royal Botanic Gardens, Glasnevin, Dablia. The large wax-like flowers have the sepals and petals of a lemon- gellow colour, the former with many, and the latter with a few bright parple spota. The front lobe of the lip is amethyst-purple, with a white fimbriation at the edge, and the side lobes are of a yellow colour on the inside and white outaids. The flower is more than 6 inches wide, mesauring acrows the petals, which have a width of $1 \frac{1}{2}$ inch. The eecond, named C . granulowa Banneri, ia from Mr. Johu Edwards, gr. to G. Banner, Etq., Sherwood, Sefton Park, Liverpool. It is an extraordinary variety, with fowers which, in a Caraation, would be called flaked. The
lower aepala have the inner halves of a pale green hae, and the oater ones parple. The upper sepal is purple with a greenish band up the centre, and the petals have similar markinga to the upper nepal, with the addition of a margin of a yellowish tint, The lip is yellow at the base, with a lilac blade atreaked with parple.
The other remarkable forms flowered with Menn, F. Sander \& Co. at St. Albanu, viz, C. granulom Dabuynonii, with clear yellow inspotted sepals and petale and richly-coloared lip; C. g. princepa, which in size most nearly approaches the C. g. gigantem, with the sepals and petals almost wholly of a rich vinous parple; and C. g. Dijanceana, which a botanist would regard as the most interesting of them all, as its mall flowers seem to indicate tho atarting-point of the species. Placing it and $\mathrm{C} . \mathrm{g}_{\mathrm{o}}$ gigantea, they are difficult to reconcile as the name species, but the other three mupply every link in the chain connecting them, J. $O^{\prime} B$.

## THE GLASNEVIN BOTANIC GARDENS.

On the occasion of a recent visit to Dablia I found time to visit the Botanic Gardens of the Iridh metropolis. The equatic-house was alone worth a visit, so well is it filled with Nympheas, many of which were in flower, including the following apecies and varietien, viz., N. Marliacea, N. n. roeea, N. D. carnea, N. Laydekeri ronea, and N. odorata alba.
The Victoria Regia tank in another house contained a specimen of this apecies with some leasa 3 to 4 feet across. In the same tank were plants of Nelumbiums and Nympbæas in great variety and perfect health. In the four semi-circular tanka here were more of these plants, the following being in bloom, viz, Nympbæa atellata, N. A. parvifolia, No o Berlin variety, N. gigantea, N. gracilis. N. blande, N. fava, N. dentata, N. Lotus rosea, N. L. Ortgieaiana, and the large Tulip-like Nelumbinm apecionum roseum.
The Orchid-houses contained more than oste hundred species and varieties in bloom. All of these plants were in aplendid condition-not an unhealthy one amongat them; and the general cleanlinems and the tasteful arrangement of the plante bespoke the care paid to their caltivation by the Carator, Mr. F. W. Moore.

## FRUIT AT GLEWSTON COURT.

The cultivation of fruit is so thoroughly well dowe at this place as to merit a few noten in the pagen of the Gardeners' Chronicle. Fruit it grown in grent quantities for market, and the whole concern is coll ducted on atrict commercial principlen, based upon and coupled with sound, practical experience; in short, it is one of those rare placen where the enterpriaing capitalist has made the anccessful experiment of fruit farming on suitable land very mach more atiafactory financially than the old played-oat syatem of corn growing and ordinary farming.

Mr. Lee Campbell, the proprietor, and Mr Wright, his gardener, are each as enthunisatic al they are clever; moreover, they are just as rondy and eager to impart information to any interested persons who choose to call. Sach an object lessod, and auch a fund of atefal knowledge available, it invaluable. It should help to colve a portion of the agricultural depression, give employment to worketh aupply better fruit to the conumer, at well at bel to check the quantity of foreign imports, which drai the money from home induatries.

Apple and Plum growing is a great anceses, bul Pears are failure. The plantation consiets about 10 acres, and contains about 6000 trees, apple they were planted about twelve yeart ago. Appl trees atand at 9 feet, and Plums at 8 feet apart. and trees are now about 9 to 10 feet in heigar, seet bathen occapy the whole ground between the thed Every tree in a perfect mpecimen, so well hare thyile been managed. There were about 600 Ecklintile Seedling in one block, and the crop on them if snormone one, ae every branch from the atem of the
tree to the extramity is a cordon of healthy fruit, and highly-coloured for the early part of the aeason. The thinnings from the tree were sent to the jammakers, welling at 68 , per cwt . in the middle of July, the beat-placed frrits being allowed to remain. Peangood' Nonsucb, Golden Spire, Cox' Orange Pippin, American Mother, and many other varietien
were evidently benefited by these operations. Other orchard are found on the farm, but nothing that can compare with this one in the quality of the froit.
Grapes are largely grown ander glass, and the Vines are marvels of high caltivation. Three years ago when I saw the huge crop of Muscat of Alexandria in one of the houses, and the enormons crop

Fig. 34.-arundinaria smont. (ste P. 186.)
are amongat those caltivated. Probably a miatake Wha made in planting too many varietien.

The woil-a very thin layer-is aituated on the old red andatone, and gently slopes toward the valley of the Wye with a S.S E. aspect. Plums, too, are enormoully cropped, Victoris being a great favourite, giving prefitable and remanerative cropm. Daring the late drought two steam-engines were emplosed to diatribate water, a good roaking of the land being aforded (about 1,000,000 gallons), bevides a drening of muriate of potach and aperphophate; the trees
of Black Alicante in another, I predicted that auch a crop would never again be seen on thewe Vinet, as it looked like killing the goose which laid the golden egg.

Imagine my great antonishment the other day when I called to find that the crop wal much heavier than before, decidedly better, the banches long, with heavy shoulder; berrien very large, and taking ou a bright amber colour, no signe of thanking, bat the foliage rich dark green, very luxariant and gross; evidently there was p'ant-food of the right
character within reach of the roots. Doubtless, some of these banchen will give a good account of themelves on some exhibition boarde at a later date, and show what can be tecomplished when ncience and practice go hand in hand. At all evente, the crops and results are worth going 100 miles to see, and they would teach weightier lessons than some of the technical education lectures that we are expecting so much from in the future. It it the capitalint with enterprise as well ae the worker that is wanted. William Crump, Madresfield.

## Foreign Correspondenge.

## FOOD REQUIREMENTS OF THE CHRYSAN-

 THEMUM.Tes above aubject was referred to by a correspondent in these pages on June 23, and continued Jaly 7 . 14, and 21, 1894, but an it is of great intereat to cultivators, and as it has not been possible to get experimental evidence much before this time, it may be just the proper time to return to it now.

Has anyone acted on the advice given, and with what resulte? I had expected to hear something more about it during the Chryanthemum season, but so far, nothing hat appeared. Can it be that nobody has tried the artificial manures recommended, or have triali in all cases ended in failurea, and are the reaults therefore withheld?

Being myself a cultivator of some 1500 to 1600 plants, mostly for cat flowers, and having only a light and poor natural soil for potting, I gave the question considerable attention, ite appearance being only a hort time before the final potting. Now, reliable and complete analysen of plants as that of Chryanthemums, quoted at p. 778, Gardeners' Chronicle, vol. xv., are of the greatest intereat and value to cultivators, bat, of course, they do not give exact figurew. We have got a complete analyaia of the oil we are going to une at the amme time, and as thin is in most caver difficult to get, always take a long time, and moreover it rather expenaive, it will not often be at command, bat then the plant-analynis only given approximate figures, and serves at a banis for experimente. As such I considered it, and having in my mind earlier failure by uning artificial manures in potting soil, I wat on my guard.
The soil uned for the final potting consisted of two-parts rather light and poor bat fibry turf, twoparta compont from a well-decomposed rabbinh heap derived montly from the houses, cant-away plants, old potting soil, weeds, a little ashen and charcoal (I nee firewood at fuel), \&c., and one-part masure (from horses and cows mixed). This compont, well mixed and in good condition, I still considered
 ( 6 to 8 incb), and decided to add nome artificial fertilizers.

Juet at that time, Mr. Willis' paper appeared (rol. xv, p. 778), bat for the akke of convenience I used my own mixture, having the following ingrediente at hand.
3 parts Kainit (12 per cent. potash)
3 . Basic slag (16 to 17 per cent. phosploric acid).
1 "Sulphate of ammonia ( 20 per cent, nitrogen).
1 " Phoophate of potash (28 per cent. potash, 38 per cent. phosphoric acid).
This mixture given the principal ingrediente in the following proportion:-

| Fotadh. |  |  | In Mixtare |  | In $\mathrm{AnL}_{10}$ |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  | .** | ** | ** | 1) |  |
| Phosphari |  | ** | -* | 17 | 10 |
| Soda | ** | * | - | 12 | 10 |
| Chlorine | $\ldots$ |  |  | 8 | 3 |
| Magresia | ** | -00 | -* | 16 | 10 |
| Nitrogen | ... | ** | ... | 4 | - |

beaiden this, there in afficient lime and iron in the basic ulag and sulpharic acid in the kainit. Convidering that I had a good supply of nitrogen in the atable manure, and that my anl is rether rich in potanh (reating on and originating from rock rich in potab), I thought the mixture should be a good one.
The rate in which I used it was one part of the
mixtare to about 400 parts of soil, this being considerable less than recommended by Mr. Willis, his prescription being one part of a similar manare to 250 parts of soil ( $\frac{1}{4}$ ounce to 4 lb .). Mr. W. Dyke recommends (p. 74) ten times as mach (75 ounces to 120 lb .), and still wants to supplement it later on with top-dressings. I shoald like to know with what reanit auch a quantity can be aned. The manure was well incorporated with the soil by turning it neveral time daring the fortnight it wan lying before being ased.

Daring the firat half of Jaly, part of the plants were shifted into this soil, the other part being planted out in the open ground. Daring the next two monthe, I was not satisfied with the look of them at all. They made but little progress, the leaves were amall and of a rather yellowish-green colour, still the plante were not really unhealthy, and they filled the pots well with healthy roots, but they lacked the dark-green colour and robutnens of leaf and branches which plants in the open ground possessed. At the time they were hoased ( 24 to 25 September), they were about 1 foot shorter than anael, and did not look promising at all.
But from that moment to the present time, October, 1894, they have done mach better than expected. They commenced to grow at once (for this the warmer climate may in part account), showed bude well, and they have been flowering the whole of this month quite as well as any previous year, and I think they are nomewhat earlier than usual, though I have only planted-out planta to compare with ; these were lifted some days earlier with gooa balls, and planted in an old Cacamber bed in front of the reme hoase in which the plants in pots occapy the middle. These planted-out planta got a serious check somehow (they had a few degreen of front one night, but the plants in pota had the same and one night more without any injary), cauaing the firat bude to remain undeveloped, and up to date, we have not cut a single flower from thewe, having cut about half the crop from the plants in pots, sorts the same, but they promise a rich and welcome late crop of small flowers.
The conclations I draw from this experiment, and from some earlier ones in the ame direction with other pianta, is, that artificial manares (especially kainit and basic alag), are rather dangerons substances to ane in potting soil, that I only just encaped failure when uning the above mixture in proportion of 1 to 400 , that the compost suits plants much better after mome month than at first, showing that it is advisable to have ach arbatances mixed with and well incorporated in the noil at least mome monthe before uaing it for poting. But the good crop of flowerv from rather miserable plants also show that, at last, it was the right thing. Farther, my experience confirm rather than otherwise, the general statement that manure rich in potanh and phoophoric acid promoten fertility rather than growth, and tend to make flowering and fraiting earliar.
It is all very well to know that artificial manuren, as the above, cannot with advantage be mixed with *oil that is to be ased at once, bat it would be very interesting to know why. It is not precisely injurious to the roots, at lentt I could not, by frequent and clone examination, detect any trace of injary. The only explanation I can suggent in, that by uaing there concentrated mineral altats we are sterilizing the noil, depriving it for a time of all that animal or vegetable life which otherwise decomposea, preparing and sweetening the soil, and making it more fitted for plant growth. I wish some bacteriologist could see his way to solve this problem, for to apeculate, speak, or write about it is not of mach use. I believe that in rezard to harmfolness, there is a great difference between artificial manares of animal and those of mineral origin, these lat being much the more daggeronn. This would aleo account for the many related and trustworthy casen in which much greater quantitien than the above have been applied with the best resulta. As examples of asfe manures, I shall only mention bonea for phozphoric acid, natural guano for nitrogen, and aohes (vege-
table) for potash. Bat mineral manures may also be safe if applied at the right time, and they are generally mach cheaper than the othera.
This event is a good answer to the question about theory and practice, and shortly pat it if, that theory has here, without any caution being uned, given a very dangerous advice, and your mach blamed non-theoretical, but very practical gardeners, have one and all-at least it seems so to meescaped a serioun failure by not taking any notice of the advice given, preferring to atick to old tried methods antil the new ideas have been put to the test. This is always asfe, and perhaps it is the best way to go. We gardener cannot all be masters of chemistry or other ciences relating to horticulture, but what we require are trustworthy middlemen, and these you have got in every branch of acience-in this connection only to mention Sir John Lawes and Sir Henry Gilbert. But I am again entering on this intricate question, and it is not my theme on this occation.
I cannot close thene remarks on Chrymanthemams without mentioning that it in not with unmixed pleasare I alwaya closely follow every Chryanthemum event in England from beginning to end; it is interesting to search for new varieties, and very gratifying to see almost all those procured one year appearing again in moat prize-winning stands the following season. But the pleasure is mixed. I am envious because I never anw a Chrysanthemum exhibition or an exhibition flower; we have not got exhibitions get, and I do not think it would pay to grow anch flower here for the cat flower trade. "Don't apeak about Chryanathemums, then," I hear my more fortanate Eaglish colleagaes exclaim. Still I, too, am glad to find many adrocates of our mode of culture in Eagland, and I always find great pleasure and profit in a house filled with handreds of 3 to 5 feet plants in 6 to 8 inch pote, carrying some ten to twenty flowers, each measuring 3 to 5 inches in diameter, and in almoat all the varieties that are to be found at your exhibitions. If $I$ am surprised at anything concerning Caryanthemam caltare in Eagland, it in the small number of varietiea recommended for cutting parpones. I find that the varietien C. Davies, M. G. Gruaerwald, Madame Ed. Rey, Col. W. B. Smith, Condor, Florence Davies, Gloire du Rocher, Jeanne Delaux, Marie Hoate, Miss Watwon, William Seward, Viviand Morel, W. H. Lincoln, Boqquet den Damen, F. Marrouch, Madame C. Audigaier, Mra. J. Wright, and other good exhibition sorts pay me an well as thone much recommended, and much better than do the incarved, pompon, and anemone classes. M. P. Andersen, Jönköping, Sweden.

## OUR FRUIT TRADE.

The Colonial and foreign fruit trade is growing into vast proportions, and in all fruiterers' shops, and in those of most respectable greengrocert also, at any time of the year may be found lancious fruita from lands far removed from this bay corner of the globe. No sooner is the Cape season over than in comes fruit from the Antipoder, from the Pacific bordera, and sunny lande and islands.
To-day good Oranges are keing retailed in London atreete at the rate of foar a penny !-not dried-ap rubbibh, but toothsome apheres of sweetness. As to the Cape nupplies, much has still to be learnt by thowe engaged in the trade. Some of the fruit nent to market are fine apecimens, and reward the aender; mont of the remainder ought never to have been placed here on asle. Good G:apes, Pearn, Apples, \&c, are certain to find a ready and profitable ale here, and juat when they are wanted. The Australavian fruits now helping as to bridge over the term daring which Eaglish Applen are prictically non-existent, are in excellent coadition, though they have to go to the wall in face of the grand collection of oft fruit now making beantifal the stand in every market, and in all retailers' shopm. of Tamanian Applem, it is plessant to be told by the highent authority that, "taking the seavon as a whole, the prices reached were very fair, and the
quality of the froit was generally better than that of the previous season. The general condition of the fruit on landing was also better than anal." Xear by year it may be noticed our friends at Hobart are themselves learning the lessons which experiencs teaches best. It is worth noting that the ship caral from the Mersey to Manchester is having some in fluence on the frait trade of the district, and it in contended that the cost of distribution is lowered by carry. ing fruit direct to the wharf in Manchenter. Bat be that as it may, all we have to notice is the fact that competition between Liverpool and Manchenter max lead to enlarged sapplies from all quarters of the globe, to the benefit of the consumers generally. In this connection it is interesting to observe that during the season juat closing the North of England Fruit Brokers' Association has sold upwards of 220,000 packages, made up of fruits of all kinds, from all frait-producing countries-there not being any kind of frait imported into Liverpool which have not been seen at market in Manchester.
Tue great bulk of the trade done at Mancheter has hitherto been in Valencia Oranges; but nem fields of aupply, we are told, are being formed in Italy, Sicily, Smyrna, Litbon, and Seville; and efforts are now being made to procure trade in Canadian Apples ; and so, after all, it may come to pass that all the year round we chall have a mupply of fresh fruits from whence to draw comfort and health. E.C.

## Belgium.

CHAMBRE SYNDICALE DES HORTICUL. TEURS BELGES.
The last monthly meeting of this association wa remarkable for the number and excellence of the exhibis. Certificates of Merit were awarded to M. Em. de Cock for Anthariam Scherzerianam wrir Adriani, apathe aturdy, habit fine, coloaring excellent; to M. L. De Smet-Davivier (par acclamation) for Nerine Fothergilli; the plant bore meven foral racemes, and was in a pot decorated with Adiantam, The effect was beantiful; the trases of bright cinnamon-red flower were very effective among : mass of pale Odontogloanames. A certificate mu aloo awarded to M. Emile de Cock for Grisebachis compacta nana, very dwarf, sturdy and vigorocts, very diastinct; to MM. Alsberghe and Van Oost for twenty pots of taberous Begonias, and 120 cat flowers of an excellent atrain; the peduncles firm, flowers erect, and of colours as varied as ditinct; to M. Bedinghaun for Agave Tronbetzkogana, a fing example of a specien becoming very rare; to $\frac{1}{}$ Françoie Desbois for Spirsea Anthony Waterer; to the same exbibitor and also to M. Dallière for Physalis Francheti, both well known in Eng. land; aleo to the same exhibitor for Aristolochis tricaudata, a aturdy free-flowering plant, with very singalar flowere and carions in coloaring, enpecially remarkable for their very long tailo. M. Deabois also obtained a certificate for Daphne Laureols atro-purpurea, remarkable for the peculiar coloring of the leaves, which are dark purple merging into bleck; MM. D. sbois and Pynaert obtained cefo tificates for Eaphorbia Fournieri, a plant which looks an if ita pretty green leaves were growing of a Cactas; M. Szewezick with tuberous Begonias, cal flowers, in every way admirable. Other certificaten were amarded to M. Jules Hye (par acclamation) for a Cattleya Rex, a aplendid flower of this fine planth and showing the value of the apecies; to the namis exhibitor for Laxlio-Cattleya Proserpine (L, pumis $\times$ C. velatina) also par acclanation; this fine Orchid resembles C. velutias in habit, ahd C. pumils in coloaring; to M. Joseph Alsberge (à lunaniminit) for taberous Begonias, last year's seedlinga, vigorows well-bloomed, the flowers erect and atardy.
Certificaten for good calcivation and flowering were allotted to M. L. De Smet-Davivier for Adiantum macrophyllum albo atriatum, a charming plant whereon the rous-red of the young folinge is very effective among the adult fronde, which aro atreaked with white; to the eame exhibitor for

Fig. 35.-phyllostachis vibidi gtaucescens. (set p. 186.)

Fig. 36.-phyllestacty: Qulidi. (see p. 186.)

Aralia monatroos, a fine apecimen with twentsfive glony and healthy leaves, certificate ewarded it bunanimite; to M. Kayk (nlso à l'unanimite) for Earya latifolia variegata, a epecimen of conaiderable vigoar, and very bealthy. Cortificaten were also awarded a follow: to M. Cb. Spae for Rondeletia apeciona, growing in a fae tran about 18 inches acron, and well covared with pretty flowern of bright-red colour, with orange centres; to M. Bedinghau for Sollya heterophylla, a pretty globebaped plant covered with handred of mall chinahiue, bell-shaped Gowers ; to M. Wycksert for Lycaste Dappei, a well-bloomed specimen; and to M. Szewezick for Geanerias perfecta robasta alba and latea in pots, and bearing quantities of charming flowers, and also for Selaginella Emneliana, a plant measaring more than 18 inches acros, very well grown, and very healtby. Ch. De B.

## SCOTLAND.

## DISA GRANDIFLORA.

Edinborgr.-Every year as the flowering seacon of theae plant come round, we are reminded of the great beauty of these Cape Orchide, and the amount of admiration expressed af the firat night by the visitorn, bears testimony to the popularity of this species when well grown. In a large number of establishment where collection of Orchids are grown this one is omitted, oftentimes on account of failure in its cultivation, the reason of failure being difficult to account for-different degreen of hamidity of the atmonphere, water, and other causen being brought forward as causes. But even in districts where it in known to ancceed well it is not by any mean commonly seen, but restricted to a few establishments. Here it growa with little more attention than that given to ordinary greenhouse plante, among which they are grown. The compont used is about three parts of roughly-broken peat and one of good fibry loam, with lumpe of andatone and charcoal about the size of Walnuts to keep the soil from becoming nour, owing to the large quantitien of water required. Pans are used for potting, our largent apecimen being about 18 inches in diameter, and nearly a foot deep, to allow of a large amount of drainage. In this compost the growthe are atrong, and the foliage firm and large, the atem: bearing in some cases five flowerw, from 3 to 4 inchell acrow. The plants require but little rest, the nucceeding year's growth generally appearing soon after they have finished flowering. Jant now for convenience our apecimen are occupying a place in the succulenthouse, where they are ataged apon'a bed of sphagnum, and enjoy fall expomure to the an and air, and receive copions mupplien of water. The colour of the flowers is dark, and the smbatance good. R. L. Harrow, Royal Botanic Garden, Edinburgh.

## The Week's Work.

## THE EARDY FRUIT GARDEN

By W. Pope, Gardener, Highclere Casthe, Newbury.
PINCHING LATE GROWTH8 ON FRUIT TREES - The heavy rains have generally resulted in an abundance of lateral and ablateral growth on most of the fruit trees, especially on tho which are lightly cropped with frait. Such growthe should be shortened back to one leaf, the exceptions being the shoots of 2 or 3 inche in length, which show a plamp terminal bud, and these need not be shortened. a the bnd will probably prove to be a bloom-bad: brt where meh boote on wall or espalier-trees atand out farther from the base than is devirable, they must be removed with the reat.

APRICOTB, 8TOPPING, ETC.-Continue to top the foreright thoots, and remove overgrown spurs, old and bare branchen, where such can be pared, training in joung wood thinly, so that perfect ripening in entared.

PEACHES AND NECTARINES, PINCHING AND TRAINING-AnY grose foreright bhoots on these treen hould be removed, all ablateral growtha chortened back to one leaf, and any shoot which are likely to make too vigorous and long a growth may have the point removed. Train in the young shoota thinly, and take care to allow the fruite full
exponare to light and air by fastening back or removing any of the obatructive leaver and ahoots. The bet remedy for a too luxuriant growth is lifting the treen in the early autumn months before the leaves begin to fall; this, if carefally carried out, will not fail to hasten the ripening of the wood, and other conditions being favourable, enaure a crop of fruit the following season. Where these kinds of fruit trees are grown in dry situations or ander broad glass copinge good wateringe at the root muat be afforded ss required, frequantly syringing the trees to keep red-apider in check.

Cherrieg on walls, and pyramide.-Chertie: making a secondary growth mast be kept closely stopped, sach foreright and surplus shoots as may have been allowed to grow, being now shortened to three or four leaven. If the black aphis be remarked, drene the trees with quasia solution or other geod insecticide without delay. See that all whoots for extending the trees are fastened securely, uing as fow ties for the purpose as are consiatent with asfety. Treen on walls that are healthy and atrong and yet refuse to set a crop of fruit although flowering profuagly, whould have a good dressing of chalk or old mortar rubbibh worked into the arface soil and about the roots early in the antamn, and in the apring when in flower. Afford them \& thorough watering followed by a malch. Pyramids and bushes that are making a lot of strong wood ahould be lifted early in September, and the check thus given them will be almost sure to result in speedy fraitfulness.
bueh or pyramid apples.-Pgramid and buin trees should be gone over, and sarplus growth shortened to three or four leaves, taking note of varieties that fruit at the points of the thoota, namely, Corninh Gillillower, Irish Peach, \&cc., which only need the removal of long, gross, or crowded noots. Where summer pruning has been carried out, new growth will be again pushing, and this ahould be pinched back to one leaf. Take advantage of fruit on unnamed or wrongly- ramed trees to determine the variety, and label such securely.

## THIE FLOWER GARDEES.

By Ratcer WADDs, Gardener, Birdeall Garden, York.
humea elegang.-Planta from reed nown in M3y or Jane will now be large enough to prick off into mall pots filled with light, rich, loamy soil. After watering them, place them in a cool, shaded pit or house till well entablithed, and afterwarde afford them abundance of light and air, and a further ahift into 6-inch pota in late September.

THE FLOWER BED8 will need constant attention in the matter of tidiness, and where the plants are too much crowded it will do them good to thin out the shoote nomewhat, so as to admit the air amongot them, farouring the ripening of the wood and preventing lous of leaf. The flowers should be removed from Corantium tomentam; young edgings that are to remain for the winter should be pegged down clowely.
vages and baskets.-Plants in vages and baskete should have daily attention, so as to keep the planta in a presentable condition. Do not rely on the rainfall for moistening the aoil in these receptacier, as it has very little effect, the dense foliage throwing much of it off the soil. Afford the vases one or two thorough watering in a week, according to the ntate of the weather. If the soil is very firm and hard, it should be probed with a pointed atick or piece of iron.

ANNUAL SUNFLOWERS shoald be ataked before they get blown over. A very effective bed of flowers We have seen this reason consiated of tall aingle and double Sunflowers sown in rows about 2 feet apart, then tall double and single annual Poppies sown broadcant over the bed with Shirleg Poppien and various-coloured Nastartium round the edge.
VIOLETS. - In dry localities and light woils, Violetm have suffered mach from the ravagea of redapider, and it will be advisable to remove the leaven that are the most infeated, and to syringe the plants frequently with clean water, top-dreas the beds with nome rich woil, and afford weak liquid manure once a week. Where Violeta are planted on a border on the north side of a wall they are healthy and strong, and the varieties New York and Marie Locine are lowering freely. Some gardeners cat off the runnert of Violets, but 1 let them remain, and ours are pulled to pieces in the spring, and they are not trimmed a/terwards whether grown for flowering in
the winter in framen or oatoide.

PINKB AND CARNATIONS that were atruck in
Jaly will now be ready for potting or planting in
beds, and the sooner this is done after they are rooted the better will be the results, there then
being ample time for them to get established before being ample time for them to get established before
the winter begias. For wintering Curnations and the winter begias. For a 3 inch pot is large enough. In potting, put a few crocks only in the bottom, and a bit of fertilining moss at the bottom over them, and as a potting soil use tarfy loam. Place the plants in a frame, and shade from bright sunshine for one week. When planted out, Caraations should hava deeply dug well-manured groand. Pinks may be planted at 12 inches apart in beds of four rows each; Carnations at 15 or 18 inches.
chrysanthemuma. - Beds of Madame Desgranges and other early autumn-flowering varieties should have liquid manure liberally affurded, and
the plants in the bede do not make a close mass, the plants that are at the aides and therefore exposed to the wind, shonld be secured to stakes. Mach staking in not required, as they look better when growing unrentrained. Large-flowering varieties planted against walls or fences, should have the lateral shoot removed and the bads selected as soon as it is possible to do no. The secaring of these to the fence, \&s., should have careful attention. as the shoots are readily broken by the wind. It is a mistake to tie the shoots close up to the point, it being better to leave 6 or 8 inches from the end loose.

THE KITCHEN GARDEN
By Joier Lambert, Gardenor, Powis Cante, Weishpool.
CELERY.-In most places the earliest and first planted Celery will be fit for being earthed up. The plants should first have all the shortest outside leaves pulled off, and this operation will reveal the hitherto concealed shoota round the atalk, which sinould also be removed. Having done this, gather up the leaf-stalk! firmly and pat a bast tie round them; afford a light dressing of salt and dry soot, and if the weather in dry a good watering, and wait till the plants are quite dry outside before earthing them up. A mall earthing-up will suffice on this occasion.
pOTATOS.-Early varietien geverally will be the better for being lifted, inclading those which have been planted for furnishing planting nets. Change of land is always good for the Potato; and where moderate quantities of sets are purchased, it is generally found necessary the first year to grow them entirely for sets. Potatos intended for sete should be carefully dug up, not braised in any way, and thoroughly dried before they are stored. Before storing lay them thinly in an open ahed exponed to the sun. The Potato store ahould be cool and dey, and quite front-proof.

TOMATO8.-The moiat weather will have cansed much growth of shoots, which mast be entirely removed, and the leadere stopped, the time being not any too long for the ripening of all the fraits now set. It will be as well, in the case of a very robuat foliage, to cut it in half, so as to expone the fruit to the ann. Thin kind of lightening of the leaf-growth should be cautionsly carried oat, or the planta will be injared and greatly checked. I do not remember to have seen Tomatos looking more promining than this year. Water at the roots will not be required unless it be by those which are growing in pote planged in the ground. Keep those well recured to staken that are growing in the open quarter.

PARSLEY.-Continue to tranaplant any young seedlings that are large enough to bandle, and make another aowing. Lot the linea be well thinned out, an operation that is often neglected. Where cold pita can be apared, Parsley may ba pricked out, or Parnley-seed sown in them.

## FRUITS UNDER GLABS

By Riciard Parket, Gardener, Goodwood. Chichester THE POTTING OF gTRAWBEGRY PLANTS.-The potting of the plants required for forcing should be done without delay, and the removal of chowe which have been standing in a shady place since they were potted should be attended to, standing them on a coal-ash bottom in a part of the garden that has exposare to the an all day long. This is a matter of importance, as by their remaining in the made the pots might become water-logged. If the space at command in not sufficient to allow of the pota being stood on a floor of coal-ashen, they may be arranged in a double or ningle row at the sides of the garden patha, if precaution be taken to place
slates or boards for the pots to stand upon. Alwayn afford plenty of room between the planti, wo that the foliage may be properly developed. Strawberry plants shoald not be potted directly after heary rain, as the soil in the pots is then in a saturated condition, and the ramming which is necesary would turn it into a kind of puddle, which when once it is dry might prevent the water pasaing freely through it afterwards. Neither should the potting. soil be too moist, or the result will be the same. If, when water is afforded, it does not pass quickly through the soil of any of the recently-potted plantif always turn the plants out of the pota, and replem them less firmly.

POT VINEs - If the Vines have been gradallly hardened off by affording them plenty of sir, they will now be in a condition for atanding outo of doors in a sunny and sheltered ponition, to thorougbly mature. The pota containing the Vines should be elevated on other pots or on brickbats, \&c., and onl? eaough water should be afforded them to keep the soil fairly moist. Grape-vines that were plasted early in the year, and which bore fruit in May, thonld have the ahoots ahortened to three or four of the principal leaves, in order that the bads may bo matared by anlight and heat. The border mutt not be allowed to become dry, as the roote of them Vines are still in an active condition, and suatenance is very necessary in the later stages of growth.
mid season vines. - When the crop in consumed, all superfluous shoots should be remored as with pot-vinen, so as to give the principal learea fall exposure. Oatside borders that were hesily mulched during the hot weather, will be benefited ioy removing some of the mulch, and lightly digging the remainder into the border. Be carefal not to touch the job if the border is in a wet rate from recent rain.

## PLANTS UNDER GLAS8.

By W. H. Smith, Gardener, West Dean Park, Chichestru.
Winter-flowerina begoniab.-Thene varioul species will require liberal watering at the roote, and occasional applications of liquid manure, motr of them being benefited thereby whilot making gromith. If the late-atruck Begonias are allowed to remsain in the large 60 's they were potted into at firat, they yinl make plants of good size, very asefal for farnibling the dining-table or filling mall vaseen. For the decoration of roome there is nothing which surpate B. Gloire de Sceaux and Gloire de Lorrsine. have had them indoors for aix weeke at a time, asi the plants flowered nearly as well in the rooms sil the atove.

DOUBLE-FLOWERED BEGONIAB.-These platit are eastly propagated at this season if short flowerless shoots be selected. These should have the bottom leaves cat off, the shoots being cut equare across at a joint. Insert them in numbers from five to six in large 60 -pots in light sandy soil ; plece noder hand-lighta, and they will soon make tuben The tabers should be allowed to remain in the pote till the spring. A light dewing should b afforded the cuttings on sunny dayw.

CELOBIAS shoald be potted on at once, afforditer moderate abifts; atand the plants in a light poonin in the atove, and syringe them frequently. Whe the pots are filled with rootn, remove them to cooler and drier place.

VIOLETS FOR GROWING IN FRAMES. - Them plants should be kept clean and the land siinil regularly with the hoe, affording them a top-dramided of dry fresh woot. Remove runners as soon ardin red and should the planta become infested with spider, as they will in light land, thoroughly them by syringing with soap-uudm containing shodi 2 (z. of flowers-of-salphur to the gallon. This be done on two or three nights in the artits taking eare to get beneath the leaver with the out rill

Bouvardias. - Those which are the mator require bat little attention except in and looing the
atopping the growth of the thoots and ground occasionally. Bouvardias cultivated in Tee will require attention in regard to re-potting. this nection close in cold framen after re-pottion uni again well-rooted, when the lights may be withas Bouvardias in potes should be syringed twice aboul and have the shoots regularly stopped unil six weeks before they are required to flower.
BERPIED BOLANUMS IN POT8 will require 8 mel atimalant to growth now that the berries are gromind apace, for this parpose Clay's Fertiliser aprition over the surface of the soil is as good \& masi can be used.

Fig. 37.- pelllostachys nigra. (sre p. 186.)

Fig. 38.-arundinaria japonica = bambusa metael of gardens. (ale p. 186.)

## THE ORCHID HOUSES.

By W. H. Whicr, Orchid Grower, Burford, Dorking.
MILTONIA VEXILLARIA.-Plante of this charming -pecie will now be found in a anfficiently adranced atate of growth to admit of their being repotted; but before this operation is began, it will be advisable to make sure that the plants are free from the little yellow thrip which conceal themelves right down in the interior of the young growth. It is not eavy to eradicate them with a brush or aponge, and being 0 minate many of them escape detection, and much mischief is done before they are detected. The bent method of destroying these insects, and one that taken up the least amonnt of time, in to dip or wah the growth in ome afe insecticide, and afterward rinme them in tepid eoft water. For this parpone I nee nicotine-soap, at the rate of 20 . to 1 gall. of warm water; or, in a mixture, the new XL All liquid insecticide, both of which are effective deatroyer. Atter uaing either preparation I would advise carefal ahading for a few days. M. vexillaria is a plant that forms namerous fibrous roote, which panh their way junt over and under the sarface of the comport; and the plant should, therefore, have larger apace afforded for the root to ramble in than is generally allowed. The pots or pans boald be filled to about three quartere of their depth with clean crock, upon which should be placed a layer of aphagnum-moss: the plante should be well elevated above the rim of the poti, \&cc., as by so doing a greater amonat of surface is afforded the roots to ramble in. Carefully spread the old living roots over the drainage, and work in amonget them a compoat conaisting of clean ephagnum-mose with a small quantity of fibrout peat, and a fair aprinkling of crocke broken mall. Unhealthy plants and thone having but few roots hould have all the decayed part removed, and be thoroughly cleaned in every part, and repotted into pots or pan much smaller than those they have hitherto occupied. After repotting the plante, afford water very sparingly, and use a fine rose watering-can when applying it, just enough being given to entice the sphagnammons to grow. When the new growths commence to freely make roots, and they lay hold of the sides of the pot, water may be gradually increased in quantity. The temperature of the cool-house will nuit them until the nighta become chilly, when they should be removed to the intermediate-house, choosing a position in it whers air is freely admitted at all timen. The late nummer-flowering varietien, M. v. rubella and M. จ. aperba, are in some collections in full bloom, or they are just pasing that stage; thene will not require potting before the beginaing of September, and for the present they should be kept with the older apecien in the Odonto-glomam-house. The beautiful and distinct hybrid M. Bleaiana and ite variety nobilior, which wa obtained by crossing M. vexillaria and M. Roezlii, in now in fall growth. It succeeds best throughout the year in the intermediate-house, where abundant light without wan can be afforded.

THE COOL-HOUSE, -There are several plants in this division which will require to be repotted or surfaced, the more important being the varieties of Maxillarias, which are amongat the mont eanily caltivated of Orchid acceeding well with the Andean Odontoglosanme at all seasont. Such epecies as M. Sanderiana, M. Ameniana, and M. venusta, should be grown in teak-wood baskets, as the flowers frequently appear in a downward direction. Maxillaria Tarneri, M. fucata, M. grandifora, M. Lehmannii, M. lepidota, M. tenaifolia, M. luteo-alba, and M. picta grow well in an ordinary flower-pot or shallow pan, and they should be firmly potted in a compost consiating of three parts of aphagnum-mose to one of peat, mixed with a moderate quantity of mall crock-sherds. Plants of the new Cochliods Noetzlians, Menompinidium sanguineum, M, valcanicum, and many mallgrowing apecies of Oncidiume, may aluo be repotted at noon af growth re-commences. A charming plant now in bloom it the laright orange-searlet Lwlia monophylla. The plant doe beat when hang ap to the roof in a damp shaded part of the intermediatehouse. After the flowers fade, place the planta in the cool-houe to remain there till cold weather set in, when they mast be returned to their former place. Unlike the majority of Lelias, this L. monophylle should be kept fairly moist at the root at all timen. To tho who are fortunate to bave this Lelia in bloom I would advine them to utilime, if pomible, the pollen of each flower for hybriding purposes, at no doubt something diatinct an regarda colour may be obtained from it, which would form a welcome addition to our collection.

## EDITORIAL NOTICES.

Advertisemente should be sent to the PUBLISHER.
Ilustrations.-The Editor will thankfully receive and select photographe or drawings, suitable for reproduction in these pages, of gardens, or of remarkable plants, flowers, trees, tc.; but he cannot be responsibis for loss or injury.
Letters for Publication. - All communications intended for publication, as well as specimens and plants for naming. should be addressed to the Editor, 41, Wellington Strset, Covent Garden, London. Communications should be WRITTEN ON ONE SIDE ONLT OF THE PAPER, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kent as a guacrantee of good faith. The Editor does not underkapl to paurantee of good jaith. Te to teturn unused comake to pay for any contributions, or to return unused com munications or illustrations, unless by special arrangement

Origin of the Cineraria.

In regard to this subject, we have been favoured with the following communication from the Director of the Royal Gardens, Kew:-"I do not propose to pursue this subject any further. My conclusions, and the grounds upon which they are based, are sufficiently stated elsewhere, and those who are interested in the subjeot may attach what weight to them they think proper. It was never, as far as I am concerned, more than a detail in a general argument.
"There are, however, two points in the article published in your columns for July 27, upon which I should like to make some remark.
"1. It is stated that it was 'a matter of current opinion,' [at that partionlar time], that the Cineraria cruenta cultivated at Kew 'was the wild original of the garden Cineraria.' I do not think that this is the case. The 'ourrent opinion,' as far as I know, was that of the late Mr. Thomas Moore, who regarded the garden Cineraris as of hybrid origin, a view which I myselt commanicated, on his authority, to Mr. Darwin. I re-introduced the wild plant from the Canaries, and it was the observation of the fact that, flowers apart, there was no material morphologioal difference between the wild and the cultivated plant, whioh led the Kew ataff not to re-ventilate the carrent opinion but to revise it.
"2. No practical horticulturist would deny the posaibility of raising hybrids between Cineraria cruenta and other species. We know something about hybrids at Kew, and do not engage in experiments withont a definite objeot in view. The occurrence of actaal hybrids of Cineraria has nothing to do with the matter. If the garden Cineraria is of hybrid origin, the problem to be faced is how is the elimination of all trace of any
but Cineraria cruenta parentage from the vegetative organs to be accounted for? Our solution has the merit of simplioity-there was no other parent.
"It is stated in the article that'seedling plants of Cineraris cruenta differ markedly in appearance from those of a garden Cineraria. It would be interesting to see a record of accurate observations of this. W. T. Thiselton Dyer."

Mr. Freeman Mitford's paper
Hardy
Bamboos. at the Royal Horticultural Society on Tuesday last proved one of the best and most interesting lectures that have been read before the Society. He had a grand subject and a novel one, and he handled it with the ease and knowledge begotten of enthusiasm and experience. It was by no means a compilation or a paper " made to order" or to fit an occasion. It is a matter for regret that it was not illustrated, either by speoimens or by drawings. The Society, as too frequently happens in such cases, missed an opportanity. Nevertheless, when Mr. Freeman Mitford's paper comes to be read in full in the Jounal of the Society, there is no doubt it will give a great impetus to the culture of these graceful and singular plants, and the Bamboo-garden at Kew already furnishes an excellent object-lesson open to the community at large.
We are apt to associate Bamboos with something itropioal, and dimensions too gigantic for an ordinary English garden. Mr. Mitrord's paper will do much to correct this imperfect judgment. Big Bamboos there are, and many of them far too gigantic and much too tender ever to find a place in British gardens, bat Mr. Mitford gave a list of between forty and fifty species and varieties, all of which are of suitable size, some dwarf, and adapted for carpeting the ground beneath trees, and all more or less hardy. Indeed, after a winter which has in many parts of our islands destroyed even the common Gorse, Mr. Mitford is able to say that not one of the species entirely failed. Nothing worse than a severe check has occurred, a check resulting in the formation of a sheaf of small canes, but richly provided with laxuriant foliage.
Mr. Mitford gave some excellent advice as to the necessity for not planting out the Bamboos till they have recovered from the effects of their removal from their native countries or gardens where they have been grown. When received, the roots should be soaked in water for twelve hours, and then potted. They should then be placed in cool-house, and but little water given at first. In February the buds begin to swell, in March the leaves appear. Water should then be afforded freely. In May the pot-plants may be hardened off, and at the end of the month they may be planted out in their permanent quarters, which should be duly sheltered from their deadly enemy-wind. In handling the plants the greatest care should be taken not to injure the roots, nor the points of the shoots, which are very brittle. They should not be trodden in, but the roots well watered-in so as to enable them to get firm hold of the soil without risk of breakage. The soil should previously have been well double-dug. By preference it should be a rich loam, and the plants mulched with cow-manure. Wire netting may be provided to ward off the attacks of rabbits or pheasants. A little fern or bracken thrown over the stools in winter might be advisable. We need not follow Mr. Mitfond in his enumeration of the species, but refer the reader to Mr. Bean's classification of hardy Bamboos, given in our volume
for 1894 (March), where the species cultivated at Kew and elsewhere are enumerated and described, with illustrative cuts, some of which we now reproduce as opportune to the occasion. Arandinaria nitida, fig. 33 , one of the loveliest and hardiest, to quote Mr. Mitford, was formerly called A. khasyana, under the erroneousimpression that it was a native of the Khasya mountains, a hot steamy region not likely to afford many plants hardy enough to withstand our climate. The species, it appears, is really a native of the Chinese province of Szchuen, a very different climatal region.

This instance, among many more, shows the great advantage that accrues from the association of Botanical research and practioal caltivation. The culture of those plants, as in the oase of Orchids, will lead to an immense advance in our knowledge of the plants, and to the gradual establishment of a correot nomenclature, and at the same time the information gleaned as to the native countries of the plants will afford most useful hints to the cultivator.
Incidentally, we may mention a ourious $00-$ relation alluded to, with becoming cantion, by Mr. Mrtford, and that is the circumstance that all, or almost all, the species known to be hardy have the smaller veins in the leaves arranged in small but conspiouous squares, the venation being, as it is oalled, tessellate. Mr. Mitford's paper was instructive and saggestive to a high degree, but as it will doubtless be printed in full in the Journal of the Society, we need now only counsel those of our readers interested in the sabjeot to look forward to a future issue of the Journal. In the meanwhile we may refer them to Mr. Bean's Monograph already alluded to, and to Mr. Mitford's own commanioations to the Garden, and to our own columns.

At the conclusion of the leoture, some remarks were made by the chairman, Sir ALexandir Arbuthnot, and by Sir John Leewelin. Dr. Mastras mentioned that A. japonica, better known as B. Metake, Hort., thrives well in one of the densest and most insalubrious London suburbs, and even ander the shade of nome old Lime trees, where little or nothing can be induoed to grow.

Mr. Barron's Retirement. - We are requented to give pablicity to the following commanication:"In connection with the retirement of Mr. A. F. Babron from hit office of Superintendent of the Royal Horticultaral Society's garden at Chiswick, we understand that the Council have remolved to make him an allowance which is practically a retiring penaion of $£ 180$ a year. J. W

Gardeners' Royal Benevolent institu-TION.-On Wednenday lat, through the kindness of A. Mordan, Euq., a garden party was held in tho grounds of Stone House, Reigate, for the benefit of the Gardenern' Royal Benevolent Inetitution. The weather being exceedingly fine, the ground were viaited by over 1000 personn. Amongst thow preaent were Lady Jenning and party, Mra. Simpon and family, the Minses Baxter, Mr. and Mrs. Mordant Mrs. Lawder Eaton, Min Mordan, Mr. R. E. Wath Mr. Davidson, \&c. In the evening, the ground were beautifully lighted by fairy lampe and Chises lanterne, especially the verandah, which was ver! effectively illuminated. The whole of the ground and greenhouses were thrown open for the inapection of the visitore, many of whom were heard to semery on the almirable way in which the gronada wert kept by the head gardener (Mr. G. Steer), who, il should be mentioned, ably carried out the groer arrangements for the gathering. Dancing By carried on in the evening with much vigouf. this effort, the funde of the Inatitution will be best fited by more than $£ 12$.

Arundinaria Simoni.-Mr. Prinwill, of Probas, obligingly sends un flowers of the variegated form of this species. A. Fortunei is also in bloom in his garden.

A Nurberyman as J.P.-Mr.Garlies Mitchelle, nurseryman, Stranraer, has been appointed a J.P. for the county of Wigtownshire. He has acted as chairman of the parochial board for twenty-five years, chairman of the School Board of the Burgh, chairman of the governora of the High School, and chairman of the Parish Conncil. For forty years he has conducted an extensive wholesale and retail nursery buaineas, and may be said to be the father of the nursery trade in Scotland. Daring a busy life Mr. Mitchell has collected one of, if not quite the largest, libraries in the south of Scotland. The finest editions and copies of hintory, poetry, science, politics, and general literatare, ancient and modern, many rare and curious works, numerons collections of beautifully illuatrated and rare works of the finest apecimens of the bent artiste, only to be found in a few hands.

Missouri botanical garden.-A copy of the sixth Annual Report has reached us. The garden, it will be remembered, was founded at St. Louis, in accordance with the will of the late Mr. Shaw, a merchant of English extraction, and the friend of Engelmank, Asa Gray, and other botaniets of his time. Prof. Tralease is now the Difector. Among other regalations is one for the taition and training of garden papils. Two have completed their carricalum of four yeare, and received appointmente as Caratorn of Botanic Gardenn. The anbjects taught have all direct reference to gardening, and are taught practically. The whole of the first year is devoted to manual labour, and half of each day through the remainder of the course. The acientific papers in the prenent volume include monographs or esaays on N. American Sagittarias by J. G. Sxiti ; on Leitneris floribunda, by Dr. Trevease; on the disemination of Yucea, by H. J. Webser; on the Mound flora of Atchimon County, Missouri, \&c.

Experimental plant Physiology.-Mr. D. T. Macdoteal has translated the little manual of Physiology prepared by Dr. Waller Oels. It consiste of directions for the performance by the pupil of more than a handred experiments by meana of which the principal phenomena of nutrition, geotropism, growth, movements, pollination, \&c., are illustrated. The papil is not merely to sit and take notes of a lecture, nor to read a book, but to work out for himself as far as circumstances permit the details of physiology. Such a course of training woald be of immenee value to young gardeners, and in these days of county laboratories is not altogether unattainable. Lectarers will find this little volume very usefal. It may be had from Morats \& Wrison, Minneapolis, or from Williavs \& Norgate, Henrietta Street, Covent Garden, W.C.

Petit Atlaa de poche des Championons Comestibles et Veneneux" (Eatable and Poisonous Fungi), par Paul Donrér (Paris, Libraire des Sciences Natarellen, Pauc Klisckssicik, 52, Rue den Ecoles). This little hand or pocket volume is the third of a seriez devoted to natural history, and intended to sccompany a collector in his walks as well as to be ureful for reference in the atudy. The book before us contains description by which many of the commoner fangi may be recognived one from the other. Some brief information concerning microben and microncopic fangi which are more or leas intimately connected with certain diseasen, are aleo mentioned. There are thirty-aix coloured figure of fangi ineluded in this work, contributed by M. Hesas Giulet. The zection relating to the micro-fungi is too brief to be of mach service. The other portion of the volume may be commended to the notice of beginners. The figurem are good, but contain no details
conceraing the aporea.

Flowers in Seabon.- We have received from the nurwery of Measrm. Lanivg \& Mave received from flowern of varieties of the Carnation, cut from plants
in the open ground, which are everything that thoue who admire this fragrant flower could wish, although that not eanily pleased permon, the Carnation fancier, would, we imagine, not think they were all up to show form. Of eapecial good quality were Dandas, scarlet ; Mra. Reynold Hole, orange-fawn; Uriah Pike, dark carnation-red; William Wood, deep rose; Ketton Rose, and Dachenn of Fife, old ronepink in both canes; and Paul Engelheart.

Proposed Park for Hampstead. - We learn from the Journal of Horticulture that a movement has been started by a number of influential residents in Hampatead to secure the entate of the late General Fraser as a park and recreation ground. The proposed park is situated by Finchley Road and Weat End Lane, and has an area of 13 acres. The grounds are finely laid out, and abound with flower-beds and winding paths.

The Tomato Trade.-According to the West Kent Advertiser of July 27, Mr. Jonn WOOD, of Crockenhill, has been sending away nightly to the London and morthern markets between 300 and 400 peck of the fineat kinds of Tomatos.

Stock-taking: July.-The holiday laat week interfered with the pablication of the Trade and Navigation Returns for the past month, so as to prevent the isune of our aummary antil to-day. The following is our asual excerpt from the "summary" table of Importa for the month of Joly:-

| Imporis. | 1894. | 1895. | Difference. |
| :---: | :---: | :---: | :---: |
| Total value of imports | $\stackrel{\stackrel{£}{8}}{31,835,553}$ | $\underset{35,128,142}{\mathscr{E}}$ | $\begin{gathered} \text { L } \\ +3,292,589 \end{gathered}$ |
| $\begin{aligned} & \text { (A.) Articles of food } \\ & \text { and drink - duty } \\ & \text { free ... ... ... } \end{aligned}$ | 12,267,448 | 13,050,26 2 | +782,814 |
| (B.) Articles of food and drink-dutiable | 2,028,190 | 1,965,098 | -57,097 |
| Rsw materials for textile mannfac tures.... | 2,772,042 | 3,530,191 | +758,149 |
| Raw materials for sundry industries and manufactures ... | 4,063,688 | 4,829,385 | + 7055,717 |
| (A.) Miscellaneous articles ... ... | 1,076,218 | 1,103,739 | +27.521 |
| (B.) Parcel Post ... | 49,602 | 78,664 | +30,062 |

This shows a satisfactory state of things, as compared with laat year, though it should not be forgotten that there was one more working day in the past month than in the wame term last year. Animals, food and drink, textile materialn, timber, oren of copper, \&c., all show an increase - Wheat being in exces by over three - quartera of a million sterling. Rasoia showing a heavy increase, and America a heavy decrease, bat sending an increaued sappiy of Cotton. "Manufactured articlen" are an increaned quantity, chiefly in ailk and cotton goods. Altogether, with a total import of $£ 35,128,142$ there in thown a gain of $£ 3,292,589$-or rather better than 10 per cent. The annexed figures se to the importa of fruitr, \&c., are, as unual, very intereating:-

| Imporis. | 1894. | 1895. | Difference. |
| :---: | :---: | :---: | :---: |
| Eraits, raw :- |  |  |  |
| Apples env .wbueh. | 55,283 | 57.988 | $+2,600$ |
| Cherries | 90,47 | 60,047 | -33,870 |
| Plume | 105,184 | 59,010 | -108,094 |
| Pears | 154,082 | 33.903 | -117.176 |
| Grapes | 6,500 | 45,238 | +38.738 |
| Unenameratpd | 301,771 | 342,194 | -40,423 |
| Onions | 283,283 | 387.042 | +81,656 |
| Potatos .a* we. cwt. | 570,773 | 503, 882 | , 65 |
| Vegetablee, гaw, uneuumerated ove o. value | $158.178$ | $\stackrel{\perp}{204,059}$ | $\begin{gathered} e \\ +47,887 \end{gathered}$ |

Thene figures and the record an to imports convince us that time and circumstance are not inopportune in which to recall attention to the matter of light railway as emisently saited to the requirements of market gardeners and others. When railway chargen were exciting so much attention in this column, we drew attention to the advinability of making cheap lines of commanication between field, orchard, and
marketr, extending the area over which the producer could spread his wares-to his own profit a well as to that of the consumer. It would appear that our Consular and other officials on the Continent were solicited by the commercial directorate of the Board of Trade to farnish such details as they could lay hands on bearing apon the subject; this was done, and the resalting reports were hand ed to the committee inquiring into the canses of the depression in a gricalture. Now that the com. mittee have overhauled the aupply of information, the reports have been pablished, and we now learn that in the little kingd om of Belgium there are seventyfive lines, extending over 836 milen, six belonging to private companies, the remainder to the National Society of Local Railways. It is interesting to learn that their dividend have been steadily increaning. Agricultural products have benefited by the eatablishment of the lines of communication, the mont remarkable feature being the culture of Beetroot, which has received a very noticeable impetas ; and has in its turn given rise to the establishment of many sugar factories. In Prussia the light railways are thirty-seven in number, extending to some 480 miles ; the German Government anys of them that in general they appear to be well adapted to the development and improvement of agricultare, forestry, and their accessories, particularly to opening up new markets, and facilitating the carriage to and fro of manure and raw produce over a considerable area of country. Surely, enough has been given hare to prove the case for the abject under notice. In the matter of

## Exports.

An excellent report has to be made ; not in any article has a decrease to be noted-the column is is blank In the month of Jaly the exporta footed up $£ 20,559,486$, being an increase of $£ 2,160,950$ orer July, 1894. More than that, there is an increasa to note in the seven months' comparison of $£ 1,394,991$. Nearly $£ 800,000$ of the month's increase is due to American businens alone; and if the currency diffcalties over there can be settled, there is no reanon why a return of confidence all over the Union should not till further awell the tide of trade enterprise. There is no necessity to specify increases with an all-round rise, and there can be little doabt that home trade generally will expand, and handreds of thourand be qualified to judge of the purchaing powers of money!
"Journal of the Kew Guild."-We have already alladed to the recent pablication of the number for May, 1895, and may now give some indication of its contents. It opens with a portrait and brief memoir of Sir William Hoorke, the firt Director. What he did, how great was his courtely, and how potent his aid to young gardeners and atudents, is held in grateful remembrance by the older generation, and it is well that the new comern should be made acquainted with the facta aleo. The main purpoae of the guild, that of linking the Kew gardenern of the past with those of the present, seems to have been well accomplinhed, and no doabt the circulation of the present number will still farther promote that co-operation and good fellowahip which are so denirable. The items of Kew newa have mostly been pablished aiready in the gardening papern, but it is very uneful to have them collected in so convenient a form. The notes from far of members in all quarteri of the globe are mont interesting, and conatitute a feature which we would fain hope may be mach extended. Some notices of old Kewites who have paseed away will be of intereat to many who atill hold their memory dear. There are some omintions which will probably be made good in subsequent issuen. The list of old Kew rem will prove very werviceable. We congratulate the promotern on the progresu of the guild, and mot heartily wish it all attainable succens.

Cattleya Mossie, Linden's ChampionWe owe to the kindnera of M. Lucien Lindes the receipt of a fine illostration of a bearififal form of C. labiata var. Mossim, called Linden's Champiofs The bold undalate petals, the lip with a crimon
blotch edged with a white frill, and the throat straked with gold and parple, confer an air of great diatinction on this plant. It in one of many varieties, more than forty of which have been deemed worthy of being aeparately named.

The British Pteridological Society.-The annual meeting of this Society took place at Kendal,
them a splendid conflient form of Lastrea mone tana found by Mr. Whitwell, which ander auccessfal culture had far sarpansed the expectations of its discoverer, since when found it was merely caudate. A paper on "Fern Raproduction," by Mr. Cearles T. Droery, F.L.S., formed the basis of an animated discussion, dealing as it did with all the latest diacoveries in this direction, some of which were quite new to the

Fig. 40.-phyllestachos hathisaçd. (see p 186.)

Fig. 41.-bambusa tessellata. (sme p. 186.)
on Monday, Auguet 5, Bank Holiday, and notwithstanding the unpromining weather conditions, was very well attended. A number of very interesting new finda;"were exhibited by Mr. R. Lloyd Prarger, of Belfast, who read a most intereating paper relating to them and to the Irinh hunting-grounds from which they had emanated, and in which so many clove parallela have been found by him, and Mr. W. H. Pericips of name city, to nome of the rarent English forms. Mr. Sminims alwo thowed a number of finde, mong
members generally. A number of new members were enrolled, and the Society is in a flouriahing condition, and deservedly so, since, thank to the effort of a coterio of true Fern lovert, mainly revident in the locality, a contre has been formed to which, once a jear at least, the aincere admirers of our British Fern may gravitate, exhibit their find, exchange views, and in a practical fanhion determine by the general experience of the members, the rexed quention of nomevclature.

On the Tuesday, an ususl, a Fern-hunting expedition was organised to Clawthorpe Fells, where Mr. Whatwell, the keen-eyed secretary, dincovered a batch of attenuate Lastrea montana on the limestone formation, thus not merely bagging a good thing, but at the same time exploding the generally accepted theory that this pecie abhor lime, a fallacy the writer also diacovered last year on the limeatone at Carnforth, where the pecie grown abundantly and rankly in the very pockets of the outcrop.

Cornell University.-The following it the programme of the couree of Horticulture given at this Univernity:-

1. Evolution of Cultivated Plants.-Fall, i.e., autamn. Three days week. A dicussion of the carrent hypotheses of organic evolation as applied to the modification of plants, particularly of thone in cultivation. Open to students in all cournes who have taken courses 1 and 2 in Botany. Lecturen. Profestor Bailey.
[2 Landscape Gardening. -- Fall. Two day a week. A consideration of the priaciples of athetice an applied to natural scenery, with a critique of garden art. Given to students in agricultare, architecture, and otherm. Lecturem. Profensor Bailey.]

This coarse will not be given in 1895-6.
3. The Literature of Horticulture.-Fall. One day a week. A seminary in the literature of the cultivation of plante in various parts of the world, with reviews of periodical literature. Profesmor Barley and Mr. Lodeman.
4. Greenhouse Construction and Management. Fall. Two hours; one hour of lectures, and one of laboratory work once a week, by appointment. Profenor Bailey and Mr. Lodeman.
5. The Botany of Cultivated Plants. - Winter. Seminary course of one hour, by appointment. Profemar Bailey.
6. Pomology. - Winter. Three daya a week. Lectures and other class exercisen upon the cultivation of fruita. Profesmor Batcer and Mr. Lodrmans.
7. Propagation of Plants.-Winter. Two hours, by appointment, A practical lsboratory course in the multiplication of plante - grafting, budding, making cuttings, pollination, \&c. Mr. Lomman.
8. Olerisulture, or Vegetable Gardening. Spring. Two days a week. Lectures. Profenior Barnzy and Mr. Lodeman.
9. Bloricu'ture -Spring. Three hours. Lectares. Two days a week. One hour of laboratory work by appointment. Profesior Bailey and Mr. Lodmian.
10. The Theory and Practice of Spraying Plants. Spring. One hoar coarwe. Lecture and demonstrations. By appointment. Mr. Lodexan.
11. Handicraft.-Practical work in the forcing houses and gardens, with familiar talk. Throughout the year. One to three hoarp, by appointment. Profenior Bailey and Mr. Lodrman.
12. Investigation Incident to Previous Courses. For graduate and advanced atudente. Throughout the year. Hours by appointment. Prof. Barlex.

Apple Culture.-Professor Bailey sum up a report on the orchards of New York State, by the terse direction"Till,

## GIANT CACTI AT KEW.

Some interesting addition have recently been made to the collection of Cacti caltivated at Kew, a consignment of big pecimens having been obtained from Arizona with the assiatance of Prof. J. W. Toumey, of the University of that Siate. The illustration (Gg. 39. p. 187), represents the most atriking of the apecimem, which are arranged in a group in the middle of houre No.5. The two tallent stems are of Cereus giganters, the most colossal of all Cacti, a it sometimes attains a height of 60 ft . In 1890 a fioe stem of this apecies ras obtained for Kew from California, its beight being 15 feet, and it weight nearly half a ton. It flowered in 1891, and a figure of it was pablished in the Botanical Magazine, t. 7222 . The new stems of this Cereas are 9 feet higb, and each weighs about 4 cwt . The two large specimens arranged in the corners of the group are fine examples of Echinocactus Wislizeni, each weighing 4 cwt , and measuring 6 feet in height, sad 3 by 2 feet in diameter. The deep ridges are clothed with tufts of stout pines, of which the central one is 3 inches long, hooked at the tip, and hard and rigid as bone. There are maller apecimens at K 9 w which, although they have been in the collection ten year, have not grown an inch in height, from which it may be reasoned that these large examples are probably hundred of year old. Flowers are only developed on large plants; they are about 2 inches long and wide, and are ancceeded by cone-shaped fruit 3 inches long, filled with mall black Onionlike seeds. The jaice of the stems is said to serve as a a ubutitute for water when the latter is ncarce, and inatances have been known among the white trappern, where the lives of men have been aaved by this'plant. The atema are also used by the Indians as boilers, the fleshy inaide being scooped out, and the tough akin is filled with vegetables and water, and placed on the fire. As there in a plentifal appply of etam in the denert regions where this is practised, the Indiana do not trouble to carry thin
"boiler "about with them, but make a fresh one at each atage of their journeyinga.
A atill larger apecie than this is E. Vinnaga, of which a very fine example was obtained for Kew years ago. Shortly after its arrival, it was described and figured by Sir William Hooker in the Illustrated London News. It was 9 feet high, and a yard in diameter, it weight being aboat a ton. It lived only a year or two, very large stems of Cacti being evidently bad to tranaport and re-establish, even in gardens near where they grow wild.
Opuntis arboreacens, the Elk-horn Cactus, in represented in the group by two pecimens, one on each aide of the elegant Sedge-like Reatio aubverticillatus in the centre. This Cactus grows to a height of about 30 feet, branches freely, the main branches bearing numeroas cylindrical branchlets, remarkable for their oblong tuberclen and tuft of long needlelike spinem, each enclosed in a loose thin strawcoloured sheath. The skeletons of this Opantia, as seen in the deaert place where it in wild, have a ungular and startling appearance, being quite devoid of leaven, tpines, sad flesh, the white ligneous layerw forming a hollow eylinder perforated with mesh-like holes. Then skeletons are said to stand many yearn. There are example in the museum at Kew, and aluo apeciment of walking-atick made from the stems of this species. Opantis fulgida, another arborescent specie with numerou branchen and drooping cylindrical red-tinged branchlett, bearing short opines, il represented by two fine precimens.

Other intereating precien ineluded in this group are mall atems of the new Cereus Pringlei, a near ally of C. giganteas, and Opuntia arbuncula, with ulender twiggy branches, not more than half an inch in diameter, bearing thin tharp spines an inch long.

The large boulder-like object in front of the picture in an exceptionally fine apecimen of Hottentot's Bread, Tentudinaria elephantipen, which wat imported from Natal for the Colonial and Indian Exhibition, and afterward came to $\mathrm{K} \cdot \mathrm{ow}^{\mathrm{w}}$. The col-
lection of Cacti now at Kew is richer in upecies than it ever was, and considering the large size of t'e hones in which they are grown they are in good health. John Smith recorde that in 1839 a number of plants of Cereas senilis were introdaced by a trader and sold at six guineas each. What a different tory Mr . Sander of St . Albans can tell, for he sent twents nice plants of this same Cactas to the anction rooms last week, and could not get a bid for one of them; they were afterwarda bought to be dittributed from Kew at the absard price of 28 . each. A dezen plante of the recently-certifcated Echinocactus anreas were bought at the same price. The newly- formed Cactas Society may in time work ap an interest in Cacti smong Eaglish horticalturits-they are certainly ord of favour now. W. W.

## KEW NOTES.

Deodar Stbuci by Lightning at Kew.-Oje of the finest Deodars at Kgw, between the Palm-house and the temperate-house, was struck by lightning on Saturday evening last. The trunk is riven into large fragments, showing that the diaruptive force must have been enormons.

## Begonias at Kew.

After the heavy atorm of Saturday last, and the drenching showers which have occarred since, it is pleasing to notice that the beanty of the amall beds of Tuberous Begonias near the Show-house, No. 4, is not at all impaired. Oae bed consists of Taberous Begonias of mized colours, pink and white predominating. This is a very beantifal bed. Equally good are the beds of B. semperflorens rosea, B. Crimson Gem, and B. Wosthiana.

## Hunnemannia fumabiffolia.

This is one of the gayent plante in the Kew rockery just now. It is an Eschacholzia-like plant, but growing to 18 inchen or 2 feet in height, with glaucous very deeply divided leaves, and large capshaped canary-yellow flowers. It is a native of Mexico. In a wheltered situation it would form a fine plant for a bed, bat as we learn from Mr. Irvine, it is not quite robust enough to atand fall exponare to wind and rain.

## Solanom Wendlandi.

It is very remarkable how slow is the diffation in gardeas of fine plante when they do not happen to be sent out by the trade. For several years now the magnificent creeper above named has been grown at Kew, both in the Succulent-house and in the Water-Lily house. Thousands upon thousands must have admired its ample paniclen of large bluikh-violet flowers, which remain in beanty for many weeks, and yet we cannot call to mind ever having een it in a private entablishment. It was figured in our column. September 16, 1893, bat the flowers are often larger than those there hown.

## Home Correspondenoe.

DUKE OF YORK TOMATO.-I grew a few plants of this novelty last year, and have grown some this year. It is a handeme, brilliant-coloured frait, and if it have a fault, it is that it grows too large. I do not know another variety which produce such an even lot of fruit. $R . P$. Brotherston.

TABLE DECORATIONS WITH CUT FLOWER8, ETC.-Mr. F. W. Seale's atrictares in your last issue, with reference to the floral arrangement of dinner tables, seem to me very just. It often happen that insufficient room is left for the dearert and candelabra; thewe should be the firat consideration-sthe floral decorations ought to be quite sabordiaste. Most of the dinner-table arrangements I have meen at shown would drive the lady of the house and the batler to depair. The beat jadgen of table foral decorations are ladien, with a butler as assistant.
T. M. Bulkeley-Owen.

Mr. F. W. Seale's remarks on the jadging of table decoration at flower thows in the Gardeners' Chronicle of August 10, P. 160, are to
the point, and I hope that the suhject will be well threshed out, as there is, to my mind, no part of horticultural exhibitions so unsatisfactorily judged as table decorations. Over and over again, I have seen prizes awarded to clumsy overcrowded arrangements which had nothing to recommend them bat the quality of the flowers used, while taste and pleasing arrangements were passed over. I am quito ready to believe that the jadges in these casen wibl to be just, but I agree with Mr. Seale when he vara "they are totally unfit to jadge where taate and refuement are required," and I do think that in justice to all exhibitors, tbe greatest care should be taken to select judges who have proved themselves capable of judging of the qualifications. If we are to attain a high standard of excellence in thit beartiful work, the silful and artiatic decorator mut not be driven out of the competition. $F_{0}$ Potter, St. Clere Gardens, Kemsing, Sevenoaks.

TOMATO8. - Tomato-growing in the North. appear to be greatly on the increase, not in marketgardens only, but in many private establishmenta, The fruits are used as freely as any other culinary vegetable, and many of the working.clanses now value them as a usefal and palatable food-adjuncto The price of the frait from this cause is well maintained, and is not likely to auffer mach for some time to come, the foreign supplies, in northern town at least, not having increased proportionately to the demand. I have noticed that in the markets fineo looking fruit command a very high price compared with irregular fruit of amaller size. A good bright colour is readily noticed by parchasers. In gardent generally there are varietie which find favour, and grown year after year, caltivators making their own selections, and by sach means the quality is improved. Austen's Eclipse and Thomson' Excelnior have atood the teat as well as most in Scottion gardens, but among numerout triala given of varieties, Frogmore Selected takes a prominent position It did well in this garden for early supplien, that is, from the and of April onward, and it is now in good condition as a late fruiter. The earlient fruits were ob:ained by we from Acquisition, a free-bearing variety of sturdy habit, good for pot-culture. Pro eident Garfield is very large; bat it is coarse in the flesh, and not of handeome shape. In cool-houres, where Peaches, Figy, \&cc, are grown, I obtain ine crop of Tomato from plants which are potted in rich soil, and allowed to root through the pots jato fine loam. The pot are 7 -inch, with holes in bottom made large enough to allow the roots to get outside, and half planged. Few laterals ase formed, the cluaters of frait are close, and they are large and firm. M. T., Carron, Stirlingshire.

8lugs descending (see Gardeners' Chronicla, August 10, p. 160).-The following correspondence will, I think, be interesting, especially as Darwin' letter is characteristic of his modesty, courtesy, and patient attention to detail: -

Chas. Darmin, Eqq, Fir s., \&c.
Sir,-I have observed that the small white slug has acquired the power of desceading head foremost by means al a thread of slime from branch or leaf of the Vines in a hion house here. One that I showed to a medical friend lowered itself from the moist end of a stick to a depth of 1 foot, and upon the leaf which was used to entice it being remored, the slug turned in the air and climbed up the thread of slime. It appears to have the power of exuding the slime and of twisto ing it into a thread as it descends. I shall be happy to forward one of these slugs if the subject be of sufficient interest to you. I am, Sir. Yours, \&ce, W. Ro, Sept 6, 1891."

Down, Beckenham, Sept. 7, 1861.
Dear Sir,-I thank you for your kindness in having written to me. My memory is not so good as it was. but am nearly sure that I have read of aluge descending in the man ner described, but not of their having ascended. I amm $\$ 0$ much occupied with another subject that I will not aceept your oblig ing offer of zending mee living specimens. It is just possible that the alvg may be a foreign species introdaced with plants in your hot-house. I think that it would be wort while for you to repeat carefully your observations, with measure ments of height of ascent and descent, and then cend an account (saying that you were not sure whether the fact tvas known) to Nature pablished by Macmillan \& Co., Strand -With my thanks, I remain, dear sir, yours faithfully,

Ce. Darmin.
I found on further experiment and observation that the small white alugs, meanuring from 1 to $\frac{1}{3}$ isch in length, descended more than 3 feet from the Vines in preference to crawling down their youg tems, but that they could only ascend a few incherly in a moist and warm vinery, when by repeately touching their heads they were compelled to climid up their own bodies to the thread by which they bio been deacending. The death of Mr. Darwin term I nated my interest in the matter for a time,
have not hitherto pablished the resalt of my observations. The mall white slag may be found in many gardens, and is, I think, a native of this country. W. R., Streatham Hill.

In reply to De B. Crawwhay, Eiq. (vee Gardeners' Chronicle, Auguat 10), I am awaice that it is an expedient olugs often adopt when circumstances require it. I have seen them in the act many a time, especially amongat corn-stacks at harrest-time. For instance, the last load of Wheat taken up after the dew has settled on the straw late in the evening may remain on the waggon all night, and should the atabble be somewhat grasay, and aluga abundant, many of them would be located at the butt-end of the sheaver; this end would be placed outward on the waggon or on the stack, and in either case would soon get dry. The slugs which happen to be there find the sarrounding ancongenial, and at once deacend to the ground by means of a line made of alime. What a troable the es slimy crestures cause to the growers of Orchids I well know, for they can with their alime make a pathway over almost any firm surface, aa well as deacend through apace, in wearch of a dainty morsel off an Orchid, or a hiding-place. E. Blandford, Moor Hill, Westend, Southampton.

## In reference to Mr. De B. Crawthay's atate-

 ment in your last issue regarding sluga descending on plants by a line of slime, may I be alluwed to mention the fact that I have seen aluge descend that way on two different occasion, once at the Moat Narseries, East Grinstead, and once at Holmwood Park, Dorking. At the first-mentioned place, the slug deacended on to a Primula, and in the other on to a Cineraria. The alugs descended from 3 to 4 feet to get at thene plants. Foreman, Holme Grange Gardens, Wokingham, Berks.gluas And wormb.-In your laat isuae I notice $\mathrm{Mr}_{\text {r }}$ Crawshay has an article on sluga descending by their own slime. I believe that I was the first to draw attention to this fact in your own paper, as Mr. Crawshay sayn no notice was taken at the time. I see aloo a note on worms in lawns. I have no wormcasta here. I have been conversant with gardens for many years ( $I$ shall be on September 10 next, eighty years of age), both in England and the Continent. At my latt residence, Broomfield, near Chelmoford, and apparently somewhat similar soil, the roller had to be frequently cleaned. I attribute this to an earth slug which lives undergrornd. I saw one dug ap out of a flower-bed in the lawn with a small worm in itn mouth. Dig where my men will, it it very rare to find a worm here. I should like to know if any one of your numerous readers have ever seen an earth alug, or have a garden lawn free from worm-casts. The slugs are largish, white in colour, and have horna. Robert Warner.

CARNATIONB. - I was much interested in reading the account at p. 138 of the Bookham Carnations, where, if anywhere, they are certain to be aeen in good form. Readern in general will be pleased to know that they are equally aatisfactory when grown along with the maltitude of other things that every day engrose the attention of the ordinary gardener, and that they are al well fitted for ont-of-door calture as for growing in pets. Though all the sorts named in the report in question are meritorions in a high degree, there are some of cach outatanding merit that one can hardly conceive of a garden in which mweet Carnations find no honoured place, or being long without tome of them. In my opinion the mont charming of all is that named George Cruikhank. This variety ha not one bad quality, unless it be its too persistent habit of fowering. On that account I had the greatest difficulty lat year in getting any atock of it, almont every growth pindling and forming flowering atem: which yielded till late in autuma flowers of the higheat quality. No doubt hr. Donglas will remember examples I forwarded him lant October being as tine as one could expect two month earlier. The Dey, which is not mentioned in your report, is almost an attractive; as Hamow flower it ia, perhapa, better, Mre. Eric Hambro, again, I should nay, il the ideal white for how purposes; it is far superior to Nipheton, and the plant of trong and vigorous growth. I like Sadek very much, but when bloomed under glaan, it lacks the rich glowing tint that the flower asumes when planted in the open garden. The plant in of perfect upright habit, with the floweri atanding boldy up. Braw Lasi I have not jet grown. With regard to Cowslip I have not found it late in flowering. I honld term it a mid-reanon mort, not nearly
so late as Germania, nor yet so early an Harlequin. open. This, with Harlequin, is an indiapensable garden plant. The latter is wonderfully attractive, and the plant vigorous though dwarf of habit, and very floriferous. Henry Irving has alao given much satiofaction. It is the darkent of all crimson worts, and the bloom of exquisite shape and quite distiact in form from all others. Of the new yellow Carnation, the beat of all for the open border is undoabtedly Corannas it is by far the most free-blooming of all Carnations. It also possessen the merit of being one of the earliest to flower; and though in some respecta inferior to Germania, it is of greater value as a garden plant. Miss A. Campbell is almo wonderfally fine, and some will no doabt give it the preference. Dake of Orleans, with the dietinct hint of gold in its exormous blooms, in perhaps best saited for indoor caltare. R. P. Brotherston, T,

## SOcieties.

## ROYAL HORTICOLTURAL.

Avaust 13.-The meeting of the Society at the Drill Hall, Jamea Street, Weatminster, on Tuesday last, was the occasion of an interesting and beatiful display of hardy flowert in season, including large quantities of Dahlias, Liliea, Gladiolun, Gaillardiar, \&c., and of Orchids. A variety of fruit made its appearance; and we were glad to notice an absence of thone enormons trade exhibits so common in recent years, and which aerve no nsefal pablic parpose.

## Floral Committee.

Present: W. Marahall, Euq, in the chair; and Measra. J. Fraser, J. Laing, C. T. Druery, H. B. May, H. Herbst, R. Dean, G. Stevens, J. H. Fitt, R. B. Lowe, C. J. Salter, W. Bain, C. Blick, H. J. Jonen, J. D. Pawle, C. E. Soea, J. Walker, J. T. Bennett Poë, H. Turner, and H. H. D'Ombrain.
From the famous. Fern nursery in Dyson's Lane, Upper
 Ferns that was rich in varieties of Pteris, Asplenium, Adian
tum, Nephrolepis, Davallia, Platycerrum, Acrostichum, \&c of Pteris we remarked P. cretica Wimsettii, P. serrulata gloriosa, and $P$. Beaurita argentea. Of Adiantams, 4. cuneatum variegatum. A. plumosum, and many others. the fine-looking Nephrolepis davallioides furcans, Aaplenium Baptisti, and another much resembling it, but unnamed; A. marginatum, with bold fronds of a light green tint; Onychium auratum, Platycerium stemmaria, P. grande, and P. Willincki, Actiniopteris radiata, a singular-looking and P. Willincki, Actiniopteris risiata, a gingular-looking Sporodocarpum glauca, Adiantopeis radiata and A. dolabriforme. Polypodium trioides, \&c. (Gold Flora Medal).
A few varieties of Gaillardias in considerable numbers were shown by Messrs. Kelwhy \& Sows, Langport, Somersetshire. These flowers had chiefly rays coloured crimson as regards the basal part, with more or less of yellow at the tips. The crimson and yellow varieties were Vivian Grey, Vauqueline Gloire, and John Kelway; Gold-dust was of a very bright tint of Gloire, and John Kelway; Gold-dast was of a very bright tint of
yellow. They aleo showed fruiting sprays of Rabus phoaicoyellow. Chey aloo showed fruitimk sprays
Mesars. Cripps a Sox, Tumbridge Wolla, showed Apparagua Sprengeri, which the committee wiahed to see again; and Daphne laureola, with purple foliage. A Clove Carnation of the true colour and scent, came from Mrs. TUDWAY, 17. Lower Berkeley Street. The habit of the plant is good, but the flower was, as seen, too small. A new Viola, W. Haig. a beautiful royal blue-col oured variety, came from M bertson, Rothesay, N.B.
Mesars. R.WALLace \& Co., St. John's Street, Colchester, exbibited a collection of bulbous flowers, including the follow ing: Tigridia grandiflora lilacea, a very handsome variety, of
a lilacy-rose colour; T. g. aurea, quite as pretty in its way as the other; Montbretias aurea and Etorle de Feu; Hemerocallis aurantiaca major, a fine large flowered variety; Lilium Henryii, L. Lowii, L. Batemaniæ, L. auratum platyphyllum; some varieties of Gladiolus Lemoinei, much improved in colour and size of flower and spikes. Altogether an interesting as well as brilliant group of plants (Silver Banksian Medal).
W. Robisson, Eeq., Rust Grinstead, showed hardy Water Lilies, and leaves of great vigour and size (Bronme Banksian Medal).
Mesers. J. V"eitch \& Soss, Royal Exotic Nursery, Chelsea, exhibited Begonia acerifolia, a foliage variety, with velvety leaves of a bronzy colour, spenkled with a silvery colour, the main ribs of the leal being of a light tint of green. The leat is palmate, with deep rugged indentations on the edge. B. Burkei is a vigorous grower, the leaf green, with deep indentations, and leaf-stalk splashed with red colour. B. decora is a dwarf-habited variety, with dark-brownish leaves, and veins and ribs of a light-green tint; a pretty variety, eren should and mbs of a light-green tint; a pre
Thos. Ware, Hale Farm, Tottenham, showed a collection of flowers of bulbous and herbaceous perennial planta, extremely varied as regarded the species and varieties (Silver Banksian Medal).

Mr. R. B. Lowe, gr. to Earl Brownlow, Aahridme Park,
Berkhamsted, exhibited the seldom flowered Brumarigin Berkhamsted, exhibited the seldom flowered Brunsrigis
Josephinit, a south African bulb, with a flower-stalk 2 to 3 feet high, and a corymb of small scarlet flowers, which as feet appear at the ext-emitios of radiating pediclo-s 1 foot long, and numbered in this exumple sizteen, are very whde apart. The plant received a First-class Certificate. We heard that Mr. Lown's succes was due to leaving the bull undisturbed for nine years, and affording it no water during the season of rest, that is, for a period of six months.
The Sweet Pea, Cupid, was again shown by Mr. Bukiere, Philadelphia, U.S.A. Mr. Jas. Douglas, floriat, Elenside Great Bookham, showed Carnation Britannia, a fairly full pale-ynllow variety.
Mr. MoArthun, nurseryman, Maida Vale, showed Ariseema fimbriatum and Eucharis Gortoni, the latter, a starry-flowered form, had been grown and bloomed in an ordinary rreenhouse. From the mame exhibitor there came a quantity of dwarf Bamboos and Lilies, including Lo auratum and varietie of Lopeciosum and L, elegans; these were arranged together, bloom and the capabilities of the variety whilst quite young
to produce good heads of flowers, were shown by Messrs. B. S.
Williams \& Son, Holloway, N. Messrs. P. Barr \&e Sons, King Street, Covent Garden, showed an extensive collection of cut flowers of hardy plants, L. Milleri (bright blue flowers); Chelone, Heliopsis, Tritoms Rudbeckia, Eaothera, Agapanthus, and Bocconia cordata. The collection bespole the great resources of the firm in this direc collection bespoke the great res
tion (Bronze Banlrsian Medal).
tion (Bronze Banksian Medal).
Messrs. J. Laimg \& Sons, Stanstead Park Nurseries, Forest Hill, S.E., showed largely of Codiæums (Croton), having small, well-coloured examples of the more novel varietiesMadame A. Bleu, Golden Ring, Memphis, Gordoni, Flambeau, Lady Hillingdon, and superbus. The Streptocarpus shown consisted of the varieties Baron Chandon, with violet segments and throat, with purplestripes running down the latter; Oxonian has a deep violet ground colour; the othere were less distinct although pretty enough. They showed aloo three varieties in white, yellow and crimson, of bedding Antirrhinums (Silver Banksian Merial)
B. Ricketts, Esq.. Caen Wood Towera (gr., Mr. Burt),
showed Lilium auratum Burtii, a variety with a crimson band showed Lilium auratum Burtii, a variety with a crimson band on each segment, We doubt the propristy of attaching a Latin name to a mere garden variety.
From Sir Thevor Liwrence's garden, Burford Lodge (gro, Mr. Bain), came some stems and leaves of Setaria alopecurioides, furnished whth greenish-brown plumes. The leaves are of considerable length, and a width of $1 \frac{1}{4}$ inches. Mont coloured flowers; M. Etoile de Feu, Anthurium Maris, with coloured flowers; M. Etoile de Feu, Anthurium Maris, with a large white apathe, having a pink-coloured spadix and large
leaf; besides these wa a quantity of different species and reaf; beside these was a quantity of different species and in one vesel. A. Silver Flora Medal was awanded for the above-named cut flowers, \&c
Mrs. Crawford, Gatton, Reigate (gr., Mr. Slogrove), showed a fine large flowering variety of Lobelia cardinalis, named Orawfordiense, another example of an improper Latin varietal name.
A. B. Freeman-Mitrord, Batoford Park, Moreton-in-theMarsh, showed the graceful Bamboo, Dendrocalamus mombranaceus, receiving an Award of Merit.
Messrs. G. BuNYARD \& Co., Old Nurseriew, Maidstone. howed Sorbus Aucuparia, with yellow and red fruits, and a eeping variety of the last-named (Award of Merit).
A Fuchsia with yellow variegated foliage and good natura pyramidal habit, came from Mr. WITTY, Nunhead Cemetery. S.E.

Mr. W. H. BeLCHAMBER, Rose Cottage, South Park, Reigate, of artistic character, but some also showing what to avoid.

## DAELAS.

This was the first cccasion on which Dahlias put in appearance, and already new forms of the Cactus type are challenging attention, Messrs, J. Cheal \& Sons, Lowfield Nurseries, Crawley, had Arthur Cheal, vivid red, shaded with darker tint towards the centre, a fine and showy variety, singularly bright in colour (Award of Merit); Mrs. Gordon Sloane, brilliant orange-salmon, very pleasing and promising; Mrs. Wilson Noble, crimson, bright in tint, and good Cactus type Mrs. Broughton-Stirling, bright reddish cerise, very promising; and Mrs. Montefiore, bright scarlet. Evidently Mesars. Cheal \& Sons have a good strain of seedlinge of this type. Mr. J. W 4 LKER, nurneryman, Thame, had a large callection of highlydoveloped ohow tarieties, very fine indeed for 20 early in the Rawlinge, Mrs. J. Greaves, yellow self, Mies Browning as a Rawlingo, Mra. J. Greavem, y yellow melf, Mies Browning, as a pure in this variety; John Walker, the finent white self: Misa Cannell, J. C. Reid, Royal Queen, Joseph Green, R. J. Rawlinge, also a fine yellow self, and Maud Fellowes. Alvo a number of blooms of Cactus and decorative varieties, chief among the former being Delicata, Mre. Douglas, Kathleen Pictor, Countess of Radnor, and Mrs. Peart. Mr.S. Mortimer, Swise Nursery, Farnham, Surrey, Btaced nixty booms of Cactus Dahlias chiefy, in almont every case a row of three blooms of one variety; and among them the following were seen in very fine character, Lady Penzance, Apollo, Delicata, Bertha Mawley, and May Pictor, bat all wers very good. In a large groep of cut hardy flowers, Mr. T. S. WARE bad bunches of Pompon and other Dahlias, aod a new Cactus variety bearing the name of Mrs. E. Becl, bright pale orangered, with tubular flonets, a fine form of the true Cactus

## Gladrolas.

These flowers were represented by a very fine collection of ten dozen spikes from Messrs. Kelway \& Sox, The Nurseries, Langport-to two of whech, Earl of Cadogan (the individual flowers very large, the coo our rose flated with maroon on the potal edges), and Don José (purple flaked with dark), A wards of Merit were made. This last greatly resembles a variety named of Merit were made. This last greatly resembles a variety named Which they received a Certificate of Merit under this name. It is a little curious that two spikes should have been shown in London as at Taunton. Other fine new varieties were Lord George Hamilton. Robert Morrow, Dule of Devonshire (pale scarlet, with a white throat). Col. Welby, and C. T. Ritchie. From Burford Lodge, D rking, the residence of Sir Trevor LAWRENCE, Mr. W. Bain brought a collection of new varieties, English. French, and $A$ merican novelties, and chief among them Mrs. Beecher (American), a large, rosy-scarlet variety, with a
white and parple throat (Award of Merit); and Dr. Sellen white and purple throat (Award of Merit); and Dr. Sellen appeared to represent a strain of fine English varieties crossed with the best of the Lemoine type.

## Chryalifthemums.

The flozal surprise of the day were the fine new forms of hybrid annual Chrysanthemuma, all single-flowered, exhibited by Mr. HENRY Brownhill, seedsman, Sale, and obtained by croseing C, coronarium on to C. carinatum. All the flowers shown, and there were several bunches of each, were cut from plants propagated by means of cuttings, in the same way that the double varieties of C. coronariuma are propagated by the
market growers for market purposes. A wards of Merit were market growers for market purposes. Awards of Merit were yellow, with a golden disc, broed, flat florets, the flowers
large, add of fine shape; Princess May, white, with deep large, aod of fine shape; Princess May, white, with deep
yellow ring round an orange disc, florets broad, and of fine shape; elegans, pare white, with \& yellow ring round a dark dise; ard Chieftain, large bright yellow, with dark disc-very
fine. Duke of York, a deep yellow self, also very fine, failed to obtain an Award. These new forms promise to be invaluable for cutting and decorative purposes.

## Orchid Committee.

Pretent: F. W. Burbidge, Esq., M.A., in the chair; and Meaure. Ja. O'Brien (Secretary), A. H, Smee, W. Cobb, J. Douglas, T. W. Bind, E. Hill, J. Gabrie), C. Pilcher, W. H. White, H. Ballantine, H. M. Pollett, De B. Crawabay, T. B. Haywood, Dro M. T. Matere, F.R S.; and Dr. F. K äjzlin of Berlin. The meeting was a most interesting one, and it was marked by the presence of an unusual number of renlly good new hybrid Orchids. Foremost amongst these stood the handsome
Cattleya $\times$ Fowleri (Leopoldi $\times$ Hardyana) shown by J. Cattleya $\times$ Fowleri (Leopoldi $\times$ Hardyana) shown by Jo
Gurave Fowler, Esq.. Glebelands. South Woodford, and raised by Messrs, F. Sander \& Co.. Sto. Albans. The plant bore an inflorescence of two large flowers of firm texture, in colour
of a clear rosy-lilac, except the broadly-expanded, crimped front lobe of tha labellum, which was of a rich crimsonpurple, the tipe of the side lobes, which were white, bearing
a blotch of the same colour. The plant received a First-clasg Certificate.
Equally good an interesting in its way was Cattieya $\times$ Eros (Walkeriana of, Mos ixie) shown by Measrs. J. VEITCH \& Soss, Chelsea, which also secured a First-class Certificate. iana, and flowers equal in size to Cattleya Mos,iæ, and of the same warm rose hue; the labellum, which had the open form of C. Wallerisna, being crimson in colour and velvety in texture.
Another fine bybrid was Cypripediuma Massaianuma nuperbum (Rothschildianue $\times$ superbiens), shown by THos. STatter, Ebq., Stand Hall, Whitefield, Manchester (gr., Mr.
R. Johnson). In form it resmbles C $\times$ Morganim, but the flowers have broader segments than that variety. The upper sepal was white with a greenish tinge and some purple lines; the petals ivory-white spotted with purple, and the labellum brownish-rose (First-clase Certificate). The same cross was shown by Messrs. F Sander e.Co.. and Baron Sir H. Schroder. J. T. Holmes, $\mathbf{R} \mathrm{cq}$., Beechen Cliff, Bath, showed the first absolutely pure white form of Dandrobium Phalænopsis, which the Committee decided to name D. Phalænopeis var, hololeuca, that already certificated as D. P. alba, haviag pink lines on the lip. This cbarming variety received a First-class
 remarkable alike for their rarity and pood culture. One of the most interestiog was Polycycais Lehmanni, with a spray of very remarkable and pretty flowers. The repals an I petals are reflered, aud in colour yel'owish-white epotted with purple. The side lobes of the lip. which has a remarlikble structure, ate curled back bepeath the slender gr jen, parpletipped column; the broader froat lobe being white, spotted with parple, and covered with long, elender haip-lite protuberances (Botanical Cortificate). In the same group were searlet flowers scarlet flowers (Award of Merit); the pretty yellow. and-checs-
iste coloured Maxillaria fucata, with sixteen flowers (Award of Merit): three fine forms of Pha'renopsis Esmeralda, LeelioCattleya $\times$ Ezoniensis, A èrides Lawrencee rar. Sanderiana, Dendrobium longicorna (Botanioal Certificate); Calanthe matalensis, Vanda Hookeri, Polystachya odorata (Botanical Certificate); the resy singular hyb-idCypripedium $\times$ Sanderiselligerum, and the noblest plant of saceolabium coe'este yet seow, and which bore fifteen flower spilke9 (Caltural Cormmenनiation). The gronp was awarled a Silite: Baylrsian Medal.

In the group staged by J. Gurney Fowler, Esq., Glebelands, South Woodford (gr., Mr. J. Davis), were also remarked some fine spacimens. A grand plant of a noble form of together ccerulea, named Fowleri, with four spikes, bearing together Certificate, the fine old plant not yet having previously been so honoured. Leelio-Cattleya $\times$ elegans was also shown with ten flowers on a spike; and Zygopetalum rostratum, Angree
cum Scottianum, Catasetum Bungerothii, Cattleya superba splendene, Cypripedium superbum, Damidoft var., and others, were also well represented, the group secaring a Silver Banlsian Medal.
Remarkable for the fine quality of the plants and for Hisic arrangement, was a fire group by T. B. Huywson $\mathrm{Harr}_{\text {. }}$. Woodhatch Lodge. Reigate (gr., Mr. J. Salter). The group was divided into three sestions, each with a large and graceful Cocos Wedelliana in the centre. The middle and extreme ends consisted of Miltonia vexillaria and MaidenOdontoglossum Harryanum (Silver Flora Medal).
Baron Sir H. Schroder, The Dell, Egham (gr., Mr. H. Ballantine), showed a group of cut blooms of choice Orchids, including Cattleya Hardyana, Clark's variety; Mormodes lusatum ebarneum, Sobralia Lowii, Vanda insignis, V. tricolor insignis, V. Roxburghii, Rhyncastylis gutcata, Aërides nobile, A. Sanderianum, Cypripedium Stonei platytænium, and a remarkable form of Odontoglossum ramosissimum, with a densely branched spike of white flowers having purple blotches
Medal)
Mesgrs. F. SAMDER \& Co.staged an effective group, consisting mainly of many forms of Dendrobiam Phalrenopsis Schroderianum. With them ware the beautiful Odontoglosaum Wattianum, with cream-white violet-spotted labelium (First-class Certificate): Cattleya Leopoldi, Sander's var.,
one remarkajle beanty (Award of Merit); Calanthe Sanderiana, C. Laucheana, Cattleya $\times$ Kienastiana, C. $\times$ Prince of Wales, Leelio-Cattleya $\times$ elegans prasiata; the handoome . $\times$ Massaianum superbum; C. $\times$ vexillarium, $\mathbf{C} . \times$ enan thum superbum. Cattleya aurea, Catasetum fimbriatum, Radriguezia secunda, Miitonia vexillaria rubescens, Cirropetalum picturatum (Silver Banksian Medal).
petalum picturatum (Silver Banksian Medal). (gr., Mr. T. W
C. InGRAM, Esq., Elstead House, Godelming Bond), showed Leelio-Cattleya $\times$ Elstead Gem (C. bicolor $\times$ L. Eanthuma), a pretty hybrid, with yellow sepals and petals, and lip of the rich crimson-purple seen in $\mathbf{O}$. bicolor, whose influence in its form was also distinctly traceable (Award of Merit): Cypripedium $\times$ album (leucorrhodum $\times$ Schlimii), and Lexlia $X$ striata, a supposed hybrid, but whose flowers were not fully developed. E。 H. Woodsilu, Esq.. St. Nicholas House, Scarborough (ge., Mr. Hughes), showed a fine form of Vanse, Scarborough (gr., Mr. Hughes), showed a fine form of Sov, Cheltenham, sent Cypripedium $\times$ pendulum (Argus Moensii $\times$ philippinense), an elegant and distinct hybrid. Admiral R. P. Cator, Hazelwood, King's Langley (gr., Mr. G. Day), showad Eris stellata, with fine spikes (Botanical Certificate). Messrs. B. S. Williams \& Sox, Victoria and Paradise Nurseries, Upper Holloway, staged a pretty group of Cypripediums, the moat striking being $\mathrm{C} . \times \mathrm{G}$. H. Rogers (insigne violaceo-punctatum $\times \mathrm{C}$. superbiens), the ground colour of whose flowers was ivory-white, with markings of rose and purple: with it were C. $\times$ Morganix, C. $\times$ orphanum, C. $\times$ vexillarium supertum, c. $\times$ Ashburtonire expansum, $\mathrm{O}, \times$ Harrisianum superbum, C . tonsum, . 3 , cenanthum, C. Wallaertianum, \&e. T. STatter, superbum with eight flowers on a spike. F. Hardy, Esq., Tynterfield, Ashton-on-Mersey (gr., Mr. T. Stafford), sent Cattleya $\times$ Brymeriana and Leelia crisps. F. W. Moone, E.q. Glasnevin, Dublin, sent Cattleya glandulosa giganPaterson), showed wasieties of Cypripedium Godefroyæ and Zggozetaluma stapelioides. Mesors. HUGE Low \& Co. staged an effective group of Orehids, including Catasetum purum, Cyenaches chlorochilon, Cypripedium Parishii, C. Charlesworthii, Cattleya Eldorado Wallisii, Saccolabium cee'este, \&sc. R. Bronman-White, Esq., Arddarroch, Garelochead (gro, Mr. G. Roberts), sent a largs form of Odontoglossum Pescatoret, and three singular varieties of 0 . crispam, one with a broad line on each eegment being very remarkable.

## Fruit Committee.

Present: P. C. Crawley, E*q, in the chair ; the Rav. W. Wilke, Meara. T. F. Rivert, G. Banyard, J. Saltmarah, J. Cheal, A. Deav, J. Willard. J. A. Lang. J. Hudson, G Wythes, W. Balderson, G. H. Sixe, G. Raynolds. G. Noiman, R Fife, A. F. Pearson, and A. F. Barron, Secretary.
Earl Percy. Syon Houze, Brentford (gr., Mr. G. Wythes), sent Melons Excelsior, which gave both white and gcarletfleshed fruits, James Ranking, and Middlesex Eero, green-flesh. The latter was so good ag to receive an A ward of Merit unanimous'y. The parents are Hero of Ioleworth and Sion Honse. The Messrs. Rothscuild, Gunnersbury House (gr., Mr. J. Hudson), sent Melons Scarlet Hero of Lockinge, and Sutton Scarlet. both very handsome. Mesprs. G. Bunyarn \& Yons, Maidstone had Apple White Transpareat, fruits large, conical, white, and very handsome. This was tested and fornd to be so excellent overs for dessert purposes, that an Award of Merit was made. Mis Hexpenson, Oatlandy Park (gr., Mr. T. Taylor), sent very fine Princess of Wales Peaches, richly coloured (Cultural Commendation). Mr. E. J. Pbestox, Kelvey Parly, Beclenham (gro, Mr. Webster),
had very fine samples of Red Carrant Versailles, and hate growths of Raspberries carrying a heavy crop of fruit (Vote of
Thanks). Mesers. Laxton Brotaers, Bedford, showed Laxton's No. 1 Seedling Apple, from Early Julian and Yr Gladstone. Mr. F. Cleaver, Leamington Spa, sent a greenid seedling Apple Cleaver's Favourite. Mrs. Robb, Rutland Gata had bunches of Crategus speciosa and of Pyrus divaricata in fruit, the latter having both yellow and red varieties.
From A. Waterhouse, Esq.., Yattenden Court, Nembary, me seedling Peach Epicure. Mr. W A YTON, Hereford, had a bas of Victoria Plums, and one of Gladstone Apples, each holding about 20 lb . of fruit, to show how much better it is to pact fruit in this way, the boxes being cheap and non-returable The Plums were first-rate, being neatly packed in layers, bat the Apples had been broken open in transit, and thus wew not seen as they should have been (Vote of Thanks).
Mr. J. Bargo, Highgate, sent a plant of Longpod Bean us Four varieties of Dwarf French Beans,
Four varieties of Dwarf French Beans, grown at Chiswieh, and awarded three marls there recently, viz., Longfellow, Verts, had the AWard of Merit confirmed, as also had Lettrew not now exhibited, but each awarded three marks at the sani time, and mentioned in the Gardeners' Chronicle, p. 136.
A. First-class Certificate, recommended by the committee which met at Chiswick on July 26, was awarded to Riveri Early Favourite Plum, also referred to on the same page. An $\Delta$ ward of Morit was given to alpine Strawberry Rouge amelioré, a long-pointed seedling variety of the Le Qustre Sainson's section, shown by Mr. J. Hudson, Gunnersbury Hions Gardens.
A very intarestiag exhibit, from Mr. 1 CULVERWELL, sant through Dr. MasTERS, was a hybrid Gooseberry, product The branches were spineless, the leaves Currant-like frag. rant, and the fruits, small red Gooseberries, had quite s black Currant flavour. A vote of thanks was accorded for this interesting exhibit. No doubt more will be heard of it at some future day.
A Cultural Commendation was awarded to a collection of the varieties of Plums from Chiswick Gardens, grown on the wallh, These consisted of reds, Sultan, Curiew, Bittern, Lations lash Golden Esperen, Reine Claude. Comte Althanns, and Coctho Gelden Rsperen,
Pere, rich yellow.
Messrs. J. Veitce \& Sons, Chelsea, showed a fine collective of eighteen dishes chiefly early dessert Apples, numene Plums, Cherries, Pears, \&c., to which a Silver Knightin Medal was awarded. The Apples included Devonshire Quasp renden, Beauty of Bath, very handsome; Mr. Gladstach Early Harveat, Paradise Pippin, Red Astrachan; the Patis, Beurré Giffard, and Jargonelle. Plums were Czar, Fropmore Orleans, Old Orleans, Magnum Bonum, Strut, and Early Po Orleans, old Orleans, Magnum Bonum, strut, ancage, Truns lific, red; and Early Grolden Drop, July Greengage, parent Gage, Mamelone, and
some good alpine Strawberries.
Messra. G. BUNY 1 RD \& Sons, had a splendid lot of 4 ppleth some thirty-six varieties being wonderfully good so early in the season, getting also an award of a Silver Knightian Medsh Fine dishes of Gold Medal, Lord Surfield, Pott's Seediim Grenadier, White Transparent, Stirling Castle, Lord Grosenor Northern Dumpling, Old Hawthornden, Duchess of Oldenbuag Northern Dumpar Sugar Loaf, and Frogmore Prolific. Kitchen sors Palace later, promise of what may be looked for at the Crystal Palace iere alo especially if fine weather would but come. There were ain Beauty of Bath, Lady Sudeley. Red Juneating, Warceter
Pearmain, Cardinal, Mr, Gladstone, Red Quarrenden, En, Pearmain, Cardinal, Mr. Eladstone, Red Quarrenden, \&en and dessert varietien.
Messra. T. RIVERS \& Sons, Sawbridgeworth, also reveived s Messra. T. Rivers \& Sons, sawbriageworti, ald Plums, Cherries, \&cc. Good Apples were Stirling castur Ecklinville, Keswick Codling, Duchess of Oldenburg, Eariy Rivers Codlin, Cardinal, \&c.; Plums, Grand Duke, Mallaw Monarch, Oullin's Gage, from indoors and outside, to shom fitness for drying purposes: and of Cherries, Bigaresin Monstreuse de Mezel and Emperor François, white; and Bigarreau Noir de Guben, and Géant de Hedelfingen, the lattien obtaining a First-cless Certificate for its rare and rich flavouril Mr. Empeon, gro to Vere Wivg Fichd, Esq., Ampertill Mr. Kmpeon, gr. to Vere Wirgrien, including some huis House, had a nice collection of Grapes, including Silver Binlb
Muscat of Alezandria and hardy fruits: a emall Muscat of Alerandria and hardy fruits: a small before the com
sian Medal was awarded. He also placed ber mittee seedling Grapes from Madresfield Court and from Gros Maroc, but both seemed to be too like their wat the parents to be regarded as distinct. It will be seen theting. parents to be regarded as distinct. It interesting meeting

## LEICESTEB.

August 6.-Promoted by the Park Committee of the Leiceater Corporation, who allotted the liband sum of $£ 200$ to be offered in prizen, the tent abbes show took place in the fine grounds of Park, on the above date. The attendance good, and nearly 20,000 persons pased the trinalia That many of them were attracted in a greanection *ure by the Gala held in the groands in cic with the show, and by the choice masic suppliers by the four excellent bands in atten of the tent can ba no doubt; but the crowded state of fraita throughout the day amply proved that the resedalo flowers were the chief attractions. of them mes contained 136 classem, and as many of them coltagen devoted to the exhibits of amateurn and
whose interesta are the mpecial object of the show committee, and whose entries were very numerous, it will readily be understood that an immense amount of work must have fallen on Mr. John Barn, the Carator, and the acting membera of the committee. These gentlemen muat be congratulated on having brought off auch a succesaful thow under aomewhat trying circumstances, the weather being very changeable throughout the day.

The principal classes were allotted a marquee apiece, that deroted to Division A-plants being mainly occupiod by the groupe arranged for effect-which took up the whole of the middle of the tent. As at most large exhibitions, great interest centred in the competition for these groups (to occupy 100 feet), the lat prize for which was \&7. The coveted let fell to Mr. C. J. MEE of Nottingham, whose arrangement was perfect from sn artistic point of view, and moreover, the puitable. The centre was a noble Phoenir rapicola, and set up on little mounds of velvety green moss were Alooasia Sanderians, Cocos Wedelliana, and other handsome foliage plants, deriana, Cocos Wedelliana, and other handsome foliage plants,
and it was observable that the most was made of every plant in the matter of producing effect. Some of the other groups had ten times the number of plants than this one, but the quantity amothered any artistic effect. Thn 2nd prize went to Mr. Rogers, Gipsy Lane Nursery; the 3rd to Mr. H. Buakeney, Dunsmore, Rugby; and the th to Mr. Geo. Perkiss, Belgrave Gate ; all these being fairly good arrangements. Mr. C. J. Mee'b exhibit also secured the 1st prize of ries, Notta, for the best elhibit of plants, fruits, or flowera, grown with the aid of their chemical manure.
For six exotic Forna, ${ }^{\circ}$. Mr. Blakenex, Dunumore, secured let prize, with very fine specimens ; Mr. C.J. MEE, Nottingham, 2nd ; and Mr. WFATT, Oadley, 3rd.
In the clase for siz stove and gresnhouse planta, the specimens in competition were good and well grown, though not largo. Mr. W. S. Bolton, Barkley, secured lot prize; Mr. C. J. Mee, Nottingham, 2nd; and Mr. G. HRown, Stoneygate, 3rd.
Both for six aingle and six doable flowered Begonias, Mr. Jis. Wriant, Granby Street, Leicester, took 1st, with excellent speoimens in each class, and he performed the same feat in both clasees for aingle and double zonal Pelargoniums.
Cut Blooms.-The National Rose Society was aseociated with the Leicester show this yenm and in the Rose tent there was a very fine and freah-looking display. Messrs. Harkiness \& Son, Bedale, who ahowed grandly, oarried off premier honoura for the prize for thirty-six Roses (open): Mesorrs J. Cocker \& Sons, Aberdeen, being 2nd: and Mr. W. H. Frettikgiam, Beaston, 3rd.
Mor twenty-loar Roses (open), Messrs. H\&RENEss and Mosura. Cooker aloo maintained tha same position.
For twelve Teas or Noisettes, Mr. H. V. Machin, Gateford Hill, was lat; and for twelve Roses, of any one variety, Messrs. HARKNEss \& Son were lst, with fine blooms of Mrs. John Laing; Mesars. Cocker \& Sons being 2nd.
In the bouquet tent, some very fine bouqueta, wreaths, epergnes, \&cc., were ahown, the Orchids, which were repreclass for them, showing in the plant classes, there being no Mesors. Pearsor a Soss, Chilwell, took lst, both for hand and for bridal bouquets.
Frutt.-Fruits were well shown, and the great prize for the best eight distinct dishes of fruit, three varieties of Grapes allowed, two bunches of each, one Pine and one Melon only, fell to Mr. J. H. Goodache, Elvaston Castle Gardens; 2nd to Mr. W. Messengen, Woolverstone Parl Gardens, Ipswich; 3rd, Mr. J. READ, Bretby Hall Gardens, Burton.
Miscellaneous, - Carnations were well represented, and hardy perennials were good, the floe exhibit of Mesars. HarkNES3 boing a representative one. The vegetables and cottagers' clasess were numerously competed in, and among the
fine groupe not for competition, and which wore perhaps the five groupe not for competition, and which were perhaps the and double flowered Begonias, staged by Mr. T. S. WARE, Hale Farm Nurseries, Tottenham; and that of Caladiums arraoged by Meserv. PEED \& Sons, Norwood.
The fact that some of the amateurs and cottagers entered each in upwards of forty classes, proves the good work the Abbey Park show is doing, and the interest taken in it by those it is opocially designed to benefit and instruct.

## WELSHPOOL HORTICULTORAL.

Augus 8.-This aociety is to be congratulated upon the great atrides it has made aince it was firat laanched into exiatence three years ago, and it can be aafely predicted of it now that it has come to atay, ite management being in the hands of enthu* siastic and old-experienced ahow-promoters.
The show itsolh, as regards exhibits, both competitive and non-competitive, was emphatically a succoss ; among the latter, most deserving of special mention, was an arrangement the gardene conspicuous pasition in the apacious tent from fineet thing Powis Castle; as an effeot it was one of the Ferns, Orotuns, Caladiums, Amaryllis, ic., with wello Ferss, Orotuns, Caladiums, Amaryllis, *c., with welldeveloped spikes of Humes elerans standing above the arrangement, formed miniature mountains, and in the cor-
reponding valley were the popular Caladium argyrites, nice plante of the new Dracmeak Sanderiana, the exceediayly
the supporting poles of the marquee were literally clothed with Maidenhair Fern suspended in terra-cotta wall-pots. Another fine group deserving of mention came from the gardens at Llanerclwyd, Captain Lovell being president for the year.
Competing groups were numerous and lilewise good, Messrs. Jones \& Son, Shrewsbury, taking 1st honours, followed by the Misses Howell, Rhiewport. Welshpool (gro. Mr. Jones), and Mrs. Curling. Drooklands (gro, Mr. Mac farlane). The same exhibitors were successful in other plant clasees, and in Roses, which were not numerously shown, Drcssons 2nd. The small classes of cut flowers were well filled, and the quality good, floral arrangements, too, being in the open and amateurs' classes, decidedly good.
The fruit-ranks contained competitors as far off as Staffordshire, who divided the honours with the local growers. Mr. A. Joilmson, Oulton Grange, Stone (gro, F., La wabert), woa lst for eight dishes, with a highly-meritorious collection. J. Tams, The Heyes, Stone, was list for Hamburghs and Muscats, followed in each case by Mr. F. Lambert:; other successes in fruit being gained by Mrs. Cubling, the Misses Howell, Captain Pryce, Mr. A. C. Humpireys-Owen, M.P., and others.

The same names were ag ain conapicuous in the vegetable clasess, with the addition of Dr. Hawrswobth, R. Ll. Kewron, Ksq., Oswestry (gro, Mr. Duralll), Sir P. P. Jones, Newtown (gra, J. Shute), and Captain Davioson; and a word
of praive should be added for the exoellence of the exhibits in of praise should be added for the eroellence of the exhibits in this department.
The amateur's and cottager's classes bore gratifying testimony in the generally high quality of the exhibits, to the value of such societies as this, in promoting the culture of edible and ornemental vegetation to the uadoubted adrantage of the public individually and collectively. Space will not permit other than a general notice of the many noteworthy erhibite, but mention muat be made of a fine diaplay of herbaceous cut flowery and of tuberous Begonias (for which special a wards were granted) from Messrs. W. Clibran \& Son, Altrincham ; an exhibit of plants by Messers. Dicksons, Chester; and a simuilar exhibit from Messrs. Kerr \& Son, Liverpool; a table of herbaceous blooms from Messrs. CuTbusgr, of Highgate ; a miscellaneous exhibit from Measrn. Jones \& Son, Shrewsbury; and a large collection of sweet Peas from Mr. ECEFORD's gardens at Wem.
$A$ word of credit is due to Mr. Lambert, the indelatimable gardener at Powis Castlo, who has worked hard with Mosers. ADDIE fand WARD, the secretaries, for the success of the show, and of congratulation to the society on having so
noble and publio-spirited a patron as Cord Powis, who allowed the free use of his home park, with the rua of the famous gardens, for their benefit. Visitor

## TAUNTON HORTIOULTURAL.

August 8.-This was the thirty-eighth annual exhibition, and the society not only holds ite own am producing the largent exhibition held in the weat of England, but it every jear attracte thousanda to wee it. It was atated that it was nineteen years the thow had been held on a wet day; and this occasion proved no exception, the day was perfect ap to 3 o'clock, then a slow drizzling rain aet in, which continued antil night. Despite this drawback, there was a very large attendance. The exhibition took place as usual in Vivary Park, which having now become the property of the town, has been laid out as a public garden, and very greatly improved, though not jet completed. As is uaual, there were four very large tente quite filled with exhibits; also one for table decorations; and others for honey and bee appliances.

## Phants (Opem).

In the large plant-tent, which contained all the opon classes. plants and cat flowers fift claim attention, the sum of £20, offored as a lst prize for twelve stove and greenhouse plants in flower, always bringing a good competition. As is usual, Mr. J. OYPHER, nursoryman, Chelteaham, was $18 t$, with very fine
examples of Bougainvillea glabra and Sanderiana, the latter examples of Bougainvillea glabra and Sanderiana, the latter
smaller ia the bracts but very deep-ooloured; Ericas tricolor rosea, Thompenni, and obbata purpurea; Allamandas nobilis and grandiflora,; Phcenocuma prolifera Barnesii, Inora salicifolia, \&ce. 2nd, Mr. W. Rowland, gr, to W. Brock, Eeq., Exetar, who had much the same subjects.
With six plants, Mr. OrPEER was again 1st, having Erioss Austiniana and Aitoniana, Stephenotis floribunda, Bougainvillea glabra, Allamanda nobilis, and statice profasa. Mr. W. RowLaxd was again 2nd.
The bert group of plants arranged for effect came frome Mr. Rowhard, and had as a baokground Palms and the red-tinged Hames elegans. Bamboos were present, also gsy-coloured Crotons and dwarfer plants, foliaged and flowering, forming the foreground. Mr. W. Peel, gr. to Miss ToDd, Shirley, was 2nd.
Here was the fine.t display of large epeoimen Begorina we have yet seen. With eight plants comprising some fine double varieties, Mr. W. Thomse, gr. to W. Marsialle, Esq., Norton Manor, Taunton, Whas lst, snd Mr. W. Bond, gr. to
F. V. A. Reved, Keq., Milverton, came and; be had admirablyP. V. A. REiR, Keq. Milverton, carae and; be had admirablyin habit, but the flowers had become damaged in course of transit, which probably lont Mr. Rond the lst prize.
zual Folargoniums, both doable aoil mingte, were well grown and flowered. Fuchnias were decidedly below what wo
are accustomed to at Bath. The beat newly-introduced plant in bloom was Cypripedium Chariesworthii from Mr . W Thomas, and Mr. Cypeer was plaoed lst with four ()rehids Mr. Murrell, gr. to A. H, Miltor. Eaq., Clifton, was 2nd.

Foliaged Plants. - The best eight came from Mr. J. CYPRER, prominent among there were very fioe specimens of Keatime australis and Forsterisna, Latania borbonica, Crotone Sunset and Queon Victoria, \&c. Mr. Rowlard was placed 20d, The latter had eight exotic Ferns, having in excellent condition Miorolepla hirta oristata, Alsophile excelsa, Louco tegia immuna, Adiantum aseimile, and others, which were deservedly a warded the 1at prize, he being the only exhibitor,
Several clasest for specimen stove and greonhouse plant found a place here, but though well grown and bloomed thay do not require particularisigg.

## Out Flowers.

Those shown in the open to all diviaions, found a place round the sides of the tent. Rsses were decidediy good, the darkcoloured hybrid perpetuals largely preponderating. Messrs. Hıbiness \&ows, nurserymon, Bedele, were lot with thirty-sirand also with sightenn varieties; Mesers. TUWMsemD a Soy, nurserymen, Worcester, taking the add prizes in each

The best twolve blooms of show Dahliay came from Mensre. Hareness \& Sons ; Moara. Keynes. Whliams \& Co. bureerymen, Salibbury, taking the lat prize with twelve fancien man, Bath, was lst with nine bunches of single Dahliss ; and man, Batb, was ist with nine banches of single Dahliss; and
Mosers. Townemp \& 8 on with six bunches of $C$ actus and Moesrs. Townemid
decorative varietices.
Phlozes were good, and buaches of P. Drummondii very protty; the quilled and flat-petalled Asters showed traces of bad weather. Collectione of twenty-four spikes of Gladioli were very fine; Mr. S. Bird, gr. to W. Y. Yox, Esq., Wellington, was lat; and W. H. FowLEr, Esq.o 2nd. Carnations, Hollyhocks, and stands of doable and single Begonias were also hown.
Hardy pereanial and bulbous plants in eightoen bunches, wore very fiae. Moemra. Harinise \& Son, as at Leicester, ataging fine exhibita, tix varieties of Tigridias being oopecially fine; Mr. A. A. Walters was 2 ad.
Mr. THomas had the best twelve bunches of stove and greenhouse cat flowers, very handsome examples being ataged. Mr, Shelton, gr. to C. K. WAIT, Esq., Clifton, was 2ad.

Mr. Rowland was again 1 st with a prettily-arranged group; Mr. T. Eeeex, gr. to C. E. J. Esdaile, Esq., Biehops Lydiard, was 2nd. Mr. Bowhind was ist with twelvestove and greenhouse plants, and Mr. PIEL 2nd; but in the claes for six the positions were exactly the reverse. In the olass for four
plants, Mr. Peri was 1st, and Mr. Brocr 2nd; and the same with six foliaged plants.
Mr. PeEL had tho best six Exotic Ferne, etaging good apeoimens of a Gleichenia, Adiantum polyantha. A. cardiochlos, Davallia Moorenne, le.
Mr. R. Huxtable, gro to Y. W. Niwtow, Zsq., Taunton, was the only exhibitor of Hardy Ferns, and Moses, teking the lat prize.
Some fine specimens of Lilium specionum ware ataged, and nent bushes of Fuchsias. Mr. Thomes had the best six plants neet bushen of Fuchsias. Mr. ThoMAs had the best six plants
of single, and Mr. W. H. Fowler of donble Begonius. Some oxcellent specimens of Achimenes gained a let prize for Mr. Essex, they were Mauve Queen, Margaretta, Perfection, and Ambrose Verschaffelt, four excellent exhibition varietice. There were clases aleo for Coleus, Petuniss, Oloxinias, Cockscombe, table plante, de.
Cut flowers by amxteurs were numerous and good, and Mr. Thos. Hosbs, of Bristol, is to be congratulated on beating Dr. Budd, of Bath, with twenty-four, and twelre Rowen: Mr. $A$. H. Gray, Beth, beiog let with tweive Tens. Mr. W. H. FOWLER was las with twelve five apikes of Gladioli; and Mr. Thomss with six bunches of stove and greenhouse cut flowers Asters were in plenty, as were Drummond's Phlox; there were Dahlias also, Mr. Tros. Hobrs taking the 1st prize with twelve blooms. Pelargoniam blooms were very pretty, and Hardy Annualo very gay

Our record of the fruit shown is briet, owing to rain having driven the company to the tents and blocked the way to the tables. The best collection of eight varieties came from Mr. J. Lloyd, gr. to V. Stucker, Eaq., Langport, who had a very fine lot, consisting of Madresfield Court and white Muacat Grapes, Bellogarde Peaches, Pineapple Nectarines, Moor Part Apricots, Hero of Lockinge Melon, Bigarreau Cherries, very tine indeed, and Jargonelle Pears. 2nd, Mr. H. W. WARD, The Gardens, Iongford Captlo, Salisbury. Mr.
 was the only exhibitor of two Pineapples. The best throe bunches of Black Hamburgh Grapee, very fine, came from Mr. 4. Croseman; any othea black was well-fininhed Madresteld Court, from Mr. W 1 RD; and he had the three best buchan of whiter, from Mp. G. Webber, ©r. to G. F. Luctrall, Esq., Water, from Mr
Dunstlor
Melon, Peaches, Nectarines, Apricoth, deasert Pears, light and dark Plums, Apples (dissert and culinury), Cherries, ad bush fruith, all made a brave diaplay, the quality very good throughoat.

## Table Dec jrations

Were somewhat sparingly showa. There was but one dinner table, that from Mrs. Macaligter. Mr. H. R.Caryer had the best centre-piece, filled with dessert fruit; and Mr. J. CYPHER the best épergae. Boaquets and baikets of wild fowers made an attractive featuro.

## Vegetables.

These wore so numerous that they can only be briefly referred to. Mesors. Buttor \& Sons, Webs \& Sons, and Jarman \& Co., as well as the Society, offered prizes for six dishes in four clasess, and the lst in each case was won by Mr. T. Wilking, gr. to T. M. GUEst, Esq., Henstridge, Blandford. All these lst prize collections were very fine indeed, and wht up with admirable taste, and proved valuable object-lessons to young gardeners. Potatos, in several classer, Onions, Cauliflowers, Carrots, Paranips, Beans, Peas, Tomatos, \&c., were roally superb. In addition, there whas a large tent filled with very fine cottagers' productions in great variety, also wild flowers and honey.

## Miscellaneous Exhibits

Meosrs. Jarman \& Co., Chard and Taunton, had two collec tions, one consisting of Lilies, foliaged plants, and flowering also, Dahlias, Begonias, and other cut flowers; and a econd one of cut flowers. Messrs. Beechey, Jenkins \& Co. Kingoterwell, had Begonias, zonal Pelargoniums, sce. Mr W. J. Gonrrey, nurseryman, Exmouth, had his new Carne Clom, Reginald, in the way of Miam Joliffe, and regarded by market growers as an improvement upon it; also Wilfred Godirey, a perpetual yellow-ground variety of decided prinise also Sweet Pess, zonals, sc.
Mesors. R. Vettch sons, nureerymen, Exeter, had some very fine seedling forms of Nemesia strumora, showing a wide range of new colours ; also examples of their climbing French Beans, Dahlias, Carnstions, \&c. Mesart. Kelwhy \& Sons, nurserymen, Langport, had five boxes of Gladioli, among them some aew varieties of great merit, Certificates of Merit being awarded to the Shahzada, dark orimson-purple, very distinct; Daisy Vane, pale Jellow, very chaste; and Robert Morrow, pale rose; also Cannae, Gaillardias, and bunches of hardy flowere.

## CARDIFF HORTICULTURAL.

August 14 and 15. -This was the meventh annual hhow, and it must be admitted, denpite the changeable seamon, the bent the Society has yet held. The Sophia Gardens, in which the tenta were pitched, looked frenh in the extreme after the heavy rain. Eleven tente were required to take the whole of the exhibits, including honey, and the ahow of vegetables througbout was very fine. The morning opened guaty, but rain held off, and a brilliant afternoon brought together a very large campany.
STOVE ATD GMeraniouse plants are alwaya a lendingfenture, and Mr. J. CxpaER took the lut prize for an even collection Duffit Statice prof Bongainvillea glabra and Sanderiana, Ixora Duffi, Statice profusa, Ericas exquisita and Aitoniana, Clero desdron Balfourianum, Allamanda Hendersoni, Anthuriums wherzerianum and Andreanum, \&ce. The 2nd prize was withheld.
In the amateur clase for four specimens, Mr. J. GUNN, Llandaff (gri, B, MeLeod), was lst, having good examples of Crinum giganteum, Boagainvillea glabra, and Cissia co Fuchnias Col. Iir E. S. Hikl, M P. (gr., T. Clarke), was 2nd. Hobhy, and well blopresedted by some rery fine plants, large, bushy, and well bloomed. Col. Sir E. S. HILl was 18t; and Mr. T. Hileard, Cardiff, a working-man exhibitor, was 2nd, also with excellent specimens. Col. Sir E. S. HuL, also had the best four in the amateut division; Mr. E. CisHmas, Cardiff, 2nd.
Very good specimens of zonal Pelargoniums were staged, recalling nomething of the old days of the London Pelar gonium Society, but there is a tendency to train them a little too severely. In the clase for six apecimens, Mr. T, Hillard Ine in lst; and Mr. J. Oxemeam, Cardiff, wae 2nd.
In the elase for four specimens, Mr. C. WAldron, Llaadaff (gr., H. Bex), was lst with finely-grown and finely-bloomed plante; Major Thormeey, Penarth (gr., E. Perall), was 2nd, also with capital plante. Tuberous-rooted Begonias were good, but not equal to those seen at Taunton; the best dozen came from Mr. J. L. Thomas (gr., T. Malpan); Mr. E. LEwis (gr., G. Wale), wae agood 2nd. With six plante, Cal. Sir E. S. Hink was lot; and Mr. A. W. WintrepleLd, Candifi, znd.
Ghoupsof mpants amraged for effect falled one tint. In that frling a space of 100 feet superficial, Mears. Cast Bros., nat seircle, burdiff, were lot, the groap arranged in the form of taste. Mr but bright, hight, and graceful, showing excellent Page; Mr. R. Crosewnive, Penarth, was 2nd ; and Cal. C. H. Page, Handaff (ecr., Mr. J. Hockley), 3nd. The beat group occupying a space of 50 feet, came from Col. Hill, very nicely arranged: M. Gowiv, Keq., Presswylfa (gr., J. Styleo), was 2ad. The beat group occupying a space of 25 feet, came from Mr. K. Lewis; Mr. C. WALDRox, Llandaff. was ind. In Begonias competiag for the two fine groups of tuberous-rooted WIRr. Col Sirg for the special prizes offered by Mr. T.S. haractarised by R. S. Ricu was lat with a collection had, also vary bright quality; and Mr. J. L. THomas was Ior, also vary bright and elleotive. Some very good plants bright in decaration wave thown, all well grawn, clean, and bright in appearance. Some very good Gloximias took the lat prize for Mr. E, Lewrs.
Fine folisged plants came from Mr. Crperer and Mr. W. of HUCELEY, Lianelly (gr. W. Carpenter). The former was 1st Belmoreans, and Cycas undulata; and four charming Cis, and -Warreai, angustifolius, Queen ; and four charming Crotons fnely-coloured.
The bent eight atove and neenhouso Ferais came from Col.
Sir E. B. Hins, a very fine lot, chie amone

Woodwardıa radicans, Davailia Mooreana, Adiantum Frarley ense, A. tenerum, and Microlepia hirta !cristata. Mr. Jонw Gunn was a very close 2 nd; he had a splendid specimen of Neottopteris nidus, Davallia Mooreana, Oymnogramma chryeophylla, Adiantnm Farleyense, \&c.
With four fine-foliaged plants Mr. A. Petticrew, Cardiff Castle Gardens, was lst, having very good examples of Oyca revolata, Davallia Mooreana, Phognix compacta, and one othor. Mr. J. GUNN was 2nd.
With four stove and greenhouse plants, Col. PlaE was list also with very good speoimens; Mr. C. H. Bhilex, Cardiff, took the 2nd prize. The best collection of British Ferns came from Mr. W. L. Blake, Cardiff.
CUT FLOWERS, both"in the open and, amateurs' classes, made a very fine display. Mr. S. Treskder, nurseryman, Cardiff, was 1st, twelve varieties of trebles, having good blooms of J. S. Mill, S.•M. Rodocanachi, Mrs. J. Laing, Caroline Testout, Victor Hago, ac.; 2nd, Mr. R. Crosshing, Penarth.

Hoses and eighteem Teas, the same exhibitors were again list and 2nd. Some of the beat Teas ware Catherine Mermet, $\mathfrak{S}$ 。 Uun Ami, The Bride, Bridesmaid, Medea, Marie Van Houtte, Francesca Kruger, and the Hon E. Gifford. The Silver Medal of the Royal Horticultural Society' was aleo a warded to Mr; 8. Trasener, for his twolve trablen of Tea Roseg.
In the amateur's clase for twelve Roses, Mr. E. G. Garraway, Bath, was 1st ; and Mr. Thomas Hobbs, Bristol, 2nd With twelve Teas, Mr. T. Hobss took the lst prize; and Mr A. Hill Grax, Bath, was 2nd. Messrs. Keynes, Williams \% Co., Balisbury, had the best twenty-four Dahlias; and Mr. Tressider was and, beth decidedly good for so early a time With twelve bunches of Cactus, Mesors. Keynes, Williams \& Co, were 1st, with Harmony, Earl of Pembroke, Bertha Mawley, Lady Penzance, Mrs. Barnes, \&c.; Mr. W. 'Tres. sider, ind. Dahlias were also shown by amateurs. Asters were shown in twelves, the Comet varieties preponderating. The only twelve bunches of hardy perennials came from Mr. G. Garriway, Bath.
Gladioli, shown in twenty-four spikes, were good, Mr. R. Morrow, The Natseries, Leominster, was 1st, and Mr. G Clark, Cardiff, and.
Zonal Pelargoniums in banches were finely shown by Mr S. Treseder; Mr. J. Moore, Cardiff, was 2nd.

The beet twelve bunches of stove and greenhouse cut flowers came from Mr. L. GUEREX, Chepatow (gr., Mr. Chatfeld); Page was 2nd.
Annuals, shown in bunches of twelve, were very good indeed, Mr. A. Pettiarew being lst with some very fin bunohes indeed of Salpiglosses grandiflora, Malope grandiflora, wreet Peas, Lachasholzia croces, Bartonia aurea, \&c' ; 2nd Col. C. H, Page.
Herbaceous Phloxes were fairly good. The Silver Cup offered for twelve Carnations and twelve Picotees brought no competition.
Tabledecorations were a very fine feature, Mesors. Cane Broprers taking the lat prize for a table arranged with flowers and fruit; Messrs. Peelps \& Co., Cardiff, were and. In anothar class, Migy Evar Lewes, Llandaff, was 1st, and aluable sewing-machine, given by the in this class was turing Company.
Bouquets were very good indeed. Mr. A. E. Price, Cardiff, W. Treisider thad hand; Messrs. Case Bros. was 2nd. Mr W. Treisider had the best Bride's, a beautiful one, which was also a warded the Bronze Medal of the Royal Horticultural
Society; Mr. A. E. Price was 2nd. Society; Mr. A. E. Price was 2nd.
Wreaths and croses were superb. It is doubtful if they are done better anywhere than at Cardiff. Mr. A. R. Price wis 1st in both classes; Messrs. Case Bros. was 2nd with a wreath; and Mr. W. Tressider with a cross.
Buttonholes and lady's sprays were shown, and some pretty babkets and bouquets of wild flowers.
Fruits filled a commodious tent. The bast six bunches of Grapes came from Mr. Vircent Stucker, Langport (gro J. Lloyd), who had two of Black Hamburgh and Muscat of Alexandria, and one each of Lady Downes and Madresfield Court ; Mr. P. A. Clitye, Hereford (gr., R. Grindrod), was 2nd having two bunches each of Black Hambargh, Gros Maroc, and Museat of Alexandria.
Mr. T. Gutwey had the beet three bunches of Black Ham burgh; Mrs. Pictor-TURBEVILLE, Swansea, was 2nd. Mr H. PITT, Abergavenny, Wan the only exhibitor of three bunches of White Mascat, taking the 1st prize. Mr. P. A. Clive had the best three blaci, any variety; Mra. Turbevilice 2nd. Mr. Prit had the thres best buaches of any other white, having Poster's Seedling; Mr. L. GUERET was 2nd, with the same. Single bunches were also shown.
Melons ware numarous, being shown in threa classes. who had Black Hamburgh Grapes, Pineapple, Nectarie, Golden Ragle Peach, Apricots, Figes, and Melona, Mr, C. LEe Cimpbeil, Glewston Court, was 2nd, aleo with a good collection.
Mr. H. Prtr was 1st with two Pineapples, having a Queen and a Ripley Queen. Mr. W.J. Buckley was and with two Deseert Appl
CAMPBELL had the beat in but nicely coloured. Mr. O. L. Worcester Pearmain, Lady Sudeley, Mr. Gladstone. Irish Peach, and Quarrenden. Mr. V. STucker. Gladstone, Irish Ribeton, Duchess of Oldenburg. Grand Bichard, 3nd; he had some conical-shaped Apple, conieal in shape, a very hand atreaked with bright rod; Quarrendea,', Early Margaret, and
Eeauty of Bath.

With"inix dishes of Cessert Applees, Mr. G. Oharawhy hed fine lot from five-year-old bush trees on the Roglish Pamadien stock, the varieties Queen, Eoklinville, Lord Suffeld, Pen. good's Nonsuch, Pott's Seedling, and Warner's King; hand, Mr. J. Baseam Bassalig, who had Prince albert and Bir marck, differing from the foregoing. The best dessert Apple was Beauty of Bath, very fine fruit of which took the leading prizes. The best culinary, were Peasgood's Nonsuch and Lord Suffield. Cherries, Currants, Peaches, Nectarines, Apricots Plums, \&c., were also numerously shown in single dishes. Vegetables were very fine. The lst of Messra. sution a Son's special prizes for sir dishes went to M. S. Wruming, Esq., Glyn Neath (gr., C. Foster), a very fine lot. This yona gardener promises well to take high rank as a caltvator and exhibitor of vegetables. General lee, Dim Powis, was 2nd. General Lee took the 1st of Meser J. C. Wheeler \& Sons special prizes for six dishes ; Mr. 7 Richards was 2nd. The 1st of Messrs. Webe \& Soxs' spocial prizes for six kinds went to Mr. W. Moobe, Weavoc; Mr. G . Garratway was 2nd. Mr, E. Rees, Merthyr, took the let d Mesars. James Carter \& Co.'s prizes for the same number of dishes; Mr. A. Tromas, M.P., Cardiff, was 1st with their Jubilee Runner Bean. Messrs, Garraway \& Co, also offered prizes for six dishes of vegetables, Sir E. S. Hul was 1st, and Mr. E. Lewis 2nd. Messrs. Ward \& C 0 . did the same; Mr, G. Shewring took the 1st prize, and Mr. G. Clabke the and. But these are only a few leading features of a wonderful display of vegetables, the cottagers showing very fineity indeed. Miscellaneous exhibits were plentiful, and greatly aseisted the show. A Gold Medal was awarded to Messrs. W. Curbusa \& Sons, Highgate Nurseries, London, for a goodly group of plants arranged in excellent taste. Silver-gilt Medals were awarded to Messrs. Dicksons \& Co., Chester, for cut flowers; to Mr. W. Birienhead, Sale, for a large collection of Fema; to Messrs. Clibran \& Son, nurserymen, Altrincham, for representative and unique collection of succulents; ard to Mr. Phelps, floral decorator, Cardiff, for various floral deemtions. A Silver Medal was awarded to Mr. A. E. Pricg for Ferns; and a Bronze Medal to Mesars. Edwards \& Nuttall, for Edwardian decorations in Ferns.

## SHOW REPORTS, \&c.

Owing to the great prensure on our space, several reporte of Flower Shows, as well as remarke on the Fruit Crops, are unavoidably $k$ p $p$ over till next welk.

## The Weather

(The term "accumulated temperaturo" indicates the ager gate amount, as woll as the duration, of degrees of
temperature above or below $42^{\circ}$ Fahr. for the periad named: and this combined result is oxpreseed in twenty-four hours, or any other number of degrees ler an inversely proportional number of hours.)

 10. Irelsad, S.: "Ohannel falands.

THE PA8T WREK
The following summary record of the weather throughoal the British Islands for the week ending August 10, is fursion from the Meteoralogical Office :-

The weather during this week remained in ary entlled state, with frequent falls of rain in all parter it

Kingdom. Smart thunderstorms occurred from time to time, and those experienced on Saturday were very severe in many localitios.
"The temperature slightly exceeded the mean in "Scotland, N. and E., but was again below it in all other districts. The highest of the maxima were registered on the 10th, and varied from $75^{\circ}$ in 'England, S., and $74^{\circ}$ over our 'Eastern and Mialasd Counties,' to $68^{\circ}$ in 'Scotland, W.,' and to $67^{\circ}$ in 'Scotland, N.' The lowest of the minima occurred on the 8th, when they ranged from $38^{\circ}$ in 'England, S.W. and Ireland, $\mathrm{N}_{0}$ ' and $39^{\circ}$ in the 'Midland Counties,' to $44^{\circ}$ in several of the northern and eastern districts, and to $56^{\circ}$ in the 'Channel Itlands.'

The rainfall exceeded the normal amount in all districts, the fall over England being about twice as much as the rean.

The bright sunshine was again lese than the mean very generally, but showed a slight excess at some of the Scotch stations. The percentage of the possible duration ranged from 39 in 'England, B. and the Channel Islands, to 26 in the Scotland districte, 25 in "Ireland, S.,' and 23 in "Ireland, $\mathbf{N}$." "

## MARKET8

## COVENT GARDEN, August 15.

Wo cannot accept any responaibility for the subjoined reports. They are farnished to us regularly every Thursday, by the kindness of severai of the prineipal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular lay, but only the general averages for the week preceding the date of our report. The prices depend apon the quality of the samples, the supply in the market, and the dam, but often several times in one day. ondy from day to , but atten several himes in one dav. KD .

## Potatos.

Demand alow at about last wreek's prices. Supplies fairly good of all kinds. J, B. Thomas.

## SEEDS

Lormon: Aug. 14.-Mears. John Shaw a Sons, Seed Merchante, of Great Maze Pond, Borough, London, 8.E., write that, as regards new Trifolium, buyers find that they can this sesson satisfy their requirements on extruordinarily low terms. Sowing Mustard and Rape seed are also exceedingly cheap. For new Englieh winter Tares and Bye there is good inquiry. Whitu Clover seod, Trefoil, and

Italian Rye-grass are held at moderate rates. Bird seeds-are for the moment neglected. There is no alteration in either Peas or Haricots. The Board of Trade Returns give the imports into the United Kingdom of Clover and Grass seeds for the first seven months of this year as $246,480 \mathrm{cwt}$., value £364,063, as against 198,867 cwt., value $£ 502,417$, for the corresponding period of 1894

Farrivedon: August 15.-Quotations: Putitans, 90s. to 100s.; White Hebrons, 90 s. to 100 s .; Red Hebrons, $80 \%$ to
 9.8.

London Averages: August 14. -snowdrope, 75s, to $95 s$. Puritans, 80s. to 100s.; Hebrons, TOr, to 90\%: Early Begente, 65s. to 76. ; Kidneze, 60s. to Tos; Early Rove, 6b, to 75 s per ton.

Brave Rescue on Oulton Broad.-A aerioua boating accident happened on Suturday, August 10, on Oulton Broad, in which Mias Lee Barber nearly lot her life. Miew Barber and her brother were having a ail up the Broad in their jacht, the Taliaman, when a audden breezo caught the sail and the yacht luffed over. Misn Barber over-balanced herself, and in falling into the water caught hold of her brother and dragged him overboard too. Mr. B. J. Monro, son of Mr. G. Monro, of Covent Garden Market, a vinitor ataying at 14, Wellington Esplanade, Lowestoft, was pasing in a rowing boat at the time, and without heaitation, jumped into the water after Miss Barber, and managed to graap her clothing an she about to sink for the third time. He then wwam with her to a steam launch which was lying near, and also helped Mr. Barber on to his Jecht.

## EnQuIRIES.

## "He that questioneth mweh ahall learn much." -Bacow.

Gardinivg in the Canaries, - Would mome reader kindly inform me in your correspondence column as to the atate of gardening in either Madeira or the Canary Islands, and whether there is any opportunitie for emigrants? Madeira.

Tmanarfi,-Wanted, the name of one or two seed firm in the itland of Teneriffe $F, F$.

* Owing to the large increas in our circulation, we are reluctantly under the necsssity of going to press som, we ar carlior. Our contributors, who well know what this implies, with kindly aid us by sending their comsmunioations as early in the week as possible. Communicatione shorid rench us not later that Wedneeday.
**ing plants or fruits to be manalis.-Correspondents armanding plants or fruits to be named, or asking ouestions comanaing time and ressarch for their solution, must not espect to obtain an answer to their enquiries in the owrrest week. specimens should be good ones, carefrelly pocked and numbered. Tho not more than sixe should be sent at one time. Leaved only, or Lorists varieties cannot, as a rule, be named
A Flum: A. B. Either glazed atone-ware pipes of 9 inches in diameter, or special tiles with rebated edgen, the bottom being laid with ordinary brick on a solid foandation of concrate. Whichever material is used, the flue for 6 feet diatant from the furnace should consist of ordinary bricke, lined inside with fire-bricke of good quality. The covering of the flue, if made of tiles, may be covered with tiles having dish-like depression in them for holding water. In any case the flue should stand free of the walle of the house, and it need not re in ite entire sarface on the foundation, but on bricks loonely placed, any 6 inches asunder. There should be a gradual rive all the way from the fireplace to the chimney. We fear the concrete you purpose making woald not atand fire. Moreover 3 inches in thickness is too great, 2 inches would be the extreme thicknens of the sides and top.
Booss : J. G. B. requires a copy of Newton's Landscape Gardener. He should apply to some secondhand bookseller. We cannot help him.
Cracining of Prach stonk: A. M. M. Ifregular or diaproportionate growth, caused probably by too mach or by too little water at a particular atage of growth.
Evcharis: W. L. Union of two flowern is not uncommon.
Insects: J. Hogan. The larva of the Death'thead Moth, Acherontia atropos. It feeds on various plante, of which Jammin and Potato are the favouriten, chiefly at night.
Kew: E J. H. Write to the Carator, Royal Gar dens, Kew, who will nend you a form of application.
Mrlosw: G.F.G. The preparation inquired about is very efficient, if used with due cation. The formula is as follows:-In 2 quarte of cold water put 1 lb . of flowers-of-aulphar and 1 lb . of quicklime; stand on the fire, and let it come to the boiting-point alowly, atirring the ingredients occaaionally, as they are aure to settle at the bottom. Boil for ten minuter. Stand it aside to cool, and then decant the clear liquid into a stone jar, and cork it tightly. A large wine glanaful to 3 gallona of water is as sufficiently strong mixture for planta with lesves on them. It will make the water resemble milk in coloar. Wait half-an-hour after applying it, then syringe the plants with clear water.
Names of Fruit: J. Andrew. Red Aatrachan Apple, past ita beat.
Names of Plants: Correspondents not answered in this issue are requested to consult the next number. - X. 1, Sedum kamskatikam; 3, Sedum, which we do not recognise from the scrap sent.J. W. 1, Retinospora tetragona aurea, a form of obtuan; 2, Capressus Lawzoniane var.; 3, Thuia plicata; 4, Capreusue nutkaenais ; 6, C. Law-oonianna-T. WO. COMMERCE, WITH ITS SPREADING WINGS. has traversed the globe many times, and binds nations together with the strong ties of mutual self-intereat. Through ins influence London has become the metropolis of the world, and her merchants have amaseed wealth sufficient to make them the envy of princes. HOLLO WAY'S PILLS and OINTMENT have now bacome essential articles of commerce With all parts of the world. They have effected cures which all hope had been lost. In all known diseases their success all hope had been lost. In all known diseases their saccess stomach, bile, liver complaint, indigeetion, fevers, ague, the., they act like a charm, at the cure is apeedy and cortain.

SATURDAY. ATGUST 24, 1895.

TIIE ROSE GARDEN IN AUTUMN. VARIOUS are the Rose gardens of England, seldom do we come across what may be called an ideal one. Some are cramped hy want of spaoe, and, although their ambition may be great, they are unable to gratify it; others are formed to meet the wants of an exhibitor, and, while it is perfeotly true that, if you want to grow Roses of first-rate character, you must be guided by the prinoiples, and follow the methods adopted hy that olass of growers, we are fain to confess that they do not conform to any esthetio ideas of garden beauty. There are others, again, in which no respect is paid to regularity; their owner does not know much about them, and tells you that be only wants a quantity of blooms, and it is in suoh gardens as these you are apt to come across flourishing bushes of Manetti. The grouping of Roses, that is, the employing a good number of the same variety, is one of the points on whioh, if there were spaoe and mesns, one would very strongly insist. Sometimes one does come acrom beds of Mrs. John Laing and other wellknown flowers, and the effeot is very oharming ; bat as it was not given to everyone in old times to get to Corinth, so there are heights in Rosegrowing to which hamble mortals cannot arpire. But there are some things whioh are common to all kinds of Rose-gardens, and suggestions which are applicable to all; and the Rose-grower an he looks round apon his garden may be thankfal that such things as Roses in autumn can be written about-there was a time when wo had nothing of the kind. Hybrid perpetasls (a very misleading name to be given to them) were anknown; there are many of them which, while they have a good bit of the hybrid, they have very little of the perpetual in them-but, nevertheless, there are many which give us blooms after the first flush of the summer flowering is over, leading us to pleasant reminiscences of the triumphs of the past, and cheering us with hopes of the fature.
Then we were without those lovely Roses which Philip Noisette and the Frenoh raisers generally have added to our gardens in the beantifal Noisette and Tea seotions; then a few of the Bourbon Roses were hailed with gratitade when such varieties as Soavenir de la Malmaison, Mrs. Bosanquet, and Sir Joweph Paxton favoured us with flowers. But now when we go out in autumn into our Rose gardens we are surrounded with lovely blooms of the many varieties of these classes which the last thirty years have added to our colleotions. Shoot succeeds shoot, and flower after flower opens, and until the cold grip of frost lays hold upon the bushes they never cease to enliven our gardens; it is true they are not brilliant in their coloars, and so there is not the blaze amongst them that proceeds from a bed of bybrid perpetuals (indeed, we do not want that),
but it is the exquisite and delioate coloaring into which no orudity or coarseness enters that constitutes one of their chiefest oharms.
The extraordinary character of this season eem: to be maintained throughout, and now a apell of hot sutumnal weather has set in after the heavy rains which we experienced in the latter part of Jaly and the earlier part of Augast, we seem to be assured of a plentiful apply of flowers. For the past few years I have adopted a plan which seems to metothoroughly nit the Rose, namely, that of cutting out the old wood which hase flowered and thus done ita daty, for if the planta (of course, I am speaking of dwarfs), have done well, they will have sent up strong shoote, which will form the ataple of bloom for next year. In fact, it in very much the wame zort of treatment to which we sabject our Raapberrien, and for the aame reason the old wood is aselesa, and its removal admits free circalation of air to the plants, and thus tend to the ripening of the wood. When these new shoote are very long, it will be necessary to stake them; but as one very mach objects to such aids when they can be dispensed with, it may be afffcient, unless in very exposed situations, to top these long shoots, and thus not give no much play to the wind. In these suggestion I have had in view those dwarf plants which are cuitivated in the orthodox style. Where it in intended to form large bushen, and get a quantity of flowers irrespective of quality, the plants may be left to grow more naturally, although the praning-knife will be r quired to keep them, to a certain extent, in shape. Where malching has been adopted in the anmmer monthe-a practice puraued by nome, eapecially by those who have exhibitions in view-it it will now be time to remove that unsightly addition to Rone garden. I have been into some Rose gardens from which all appearance of beauty was taken away, and the whole thing was auggestive of a farmyard with Roses planted in it; if there be any of this malching now remaining it ought to be removed. Roses on walla will now require some attentionlong shoots will mate their appearance ; these ought to be nailed-in, and provision made for removing the old wood. Most of these wall hoses will probably be of the Noisette or Tea sections, and with which of these the Gloire de Dijon race is to be clamed it would be difticult to say, for the origin of the illantrious mother of this family is obscare, it having come up accidentally in a walk of the garden of Mons. Jacotot at Dijon ; bat in all probability it and some of its progeny ach an Madame Bérard, Bonquet d'Or, Belle Lyonnaise, Madame Trifle, and Baauté de l'Europe will be foand amongat these wall Rosen, for I can hardly call them climbers, becaune they do not climb. I never can apeak of Maréchal Niel as a astiefactory Rone for a wall, the pendent habit of ite bloomsexposing simply the discoloured outhide petala ; in the same way, I think, objection mast be taken to W. A. Richardson, not for the same reason, but because ar far as my experience goes, it is apt to lose ita brilliant colour and become simply a white Rone. Why it should do so I cannot anderatand, because I have seen it mont beantifully coloured under glass, notably at Lord Bravsey's \& Normanhurat, where the heat would, of coarse, be rouch more intenee than that on a wall. Some people, however, my that there are different strains of it, and that there are some which always will go white; if so, the sooner they are discarded the better, for it is useless in that form, while in its normal condition there ir no greater favourite, expecially with the ladie:
This month ia that in which Rose growery taide atock and cowsider what alteration they shall make, and what new varieties they ahall obtain; a great taste for what are called garden Rosen, and more especiall the ingle or semi-doable varieties, has been developted of late years. It would be a great pity if this taste were checked, but I think thowe who are contemplating an increane in their ntock of thene should in increane secollect that they are of a very Heeting character. The single Rones, with the exception of Macractha,

Which now and then gives a late bloom, are truly summer Rones; while Lord Penzance's hybrids of the Sweet Briar partake very much of the name character, and as yet, so far as I have seen, develop nothing of a tendency to second blooming, although I am informed that some of the newer varieties have more of this character. My own striped Briar, "Janet's Pride," which seems to be increasing in popularity, gave me last year a considerable number of necond blooms, but it cannot be depended upon to do this; therefore I would aay, to all who intend to increase their collection of these varieties, make up your mind beforehand as to how you are going to use them, and consider when you are planting ont in your mind a Rose-garden for next year whether you are going in for effect, or aimply for the enjoyment of the individual flowers.
I do not here enter on the subject of new Roses, which I think it would be well for our grower: to add to their collections, because, until the announcements are made, we do not know what they may be. I speak, of course, of those rained by our home growers, for we have long ceased to feel much interent in the long, wordy and fattering descriptions of the foreigners, few of which now seem to find a footing on our shores, nurserymen and amateara alike seeming to think they are not worth all the troable of growing, propagating, and then perhaps throwing away; whereas in the cene of our own raised flowers, we have many opportanities of seeing them, and are guided in our melections not by what we have been told, bat by our own knowledge of them, either in their growing state or when staged for exhibition. Wild Rose.

## New or Noteworthy Plants.

## DENDROBIUM (PEDILONUM) GLOMERTFLORUM, $\mathrm{Kr} z l_{0}, n$, sp.*

The habit of the plant in promining, but the pale rosy flowers are comparatively amall and inaignificant. As they appear in dense clusters of 1 to 5 on each stem, the effect is rather agreeable, neverthelen the plant cannot be ranged among our garden beauties. It flowered at Messra. F. Sander \& Co. St. Albans, July laat. Dr. Fr. Kränzlin.

## Orghid Notes and Gleanings.

## AERIDES SANDERIANUM,

Fashion has as atrong a hold upon gardenera and their employers an upon ladies and their dreseas. Even in the cultivation of Orchids, Fashion asserts her away, and the beautiful and gracefal genera, Vanda, Aërides, and Saccolabium, are now-a-daye neglected. I send you a raceme of the lovely Aëriden Sanderianum to prove, were it needed, that thin genut is well worth taking pain with. Not only are the racemes and individual flowers beantifal, but the habit of the genus is very graceful, and the numerona apecies preaent marked distinctions. I may remark that Willisme' Manual devoter only thirteen of its 800 pagen for Aëriden, while it allote ninety to Cypripedia! T: $L$.

## Cyphiprdium selligratar,

Mr. W. Ball kindly sends a flower of this apecies with two lateral sepals, one petal median and opposite the lip. This reveraion to a two-membered flower in not uncommon in Orchidn. Was the ancentral Orchid of this nature?

[^13]Cattleya Gaskelliana,
To the courtesy of Mr. W. Macdonald, Pitlocin we are indebted for some carious specimens of thi plant. There were three flowers on the raceme, ena one normal except that the inner half of each appal was lip-like, thus affording an instance of partial petalody of the sepals. We understand the plat flowered in a imilar manner last year.

## THE DAISY, BELLIS PERENNIs

Your illastration of Daisy The Bride recallan my mind the once prominent part Daisies und th form in our spring bedding. The lover of the flower will not have forgotien the great diaplay o spring flowers at the late Mr. Qailter' gromis Lower Aston, during the year 1873, in which the modest Daisy played so prominent a part. I haven vivid a recollection of it now a I have of the boile trials, and the ladie falling over the muddy plawte, scrambling to get a view of the Saltan of Zansime Here the Daisy and Viola tried to outrie each othe in quantity and attractiveness, but the Daiay took the lead. Nowhere way the Daiay to be eeen in med quantitie and perfection an at Aston; it not ouls formed long vandyked lines, ripzag and diamond beds, various other denigns, but filled ap in mam some of the most prominent placen in the grounde Now in some of our prominent pablic gardens whem flower are planted in the beds to make a apring display, the Daisy is not to be found, ae, for inntance, Hampton Court, where nearly the only apring flown are about three colourm of Polyanthas, or banch Prim. rose, more properly called; these are very well dose, and make a good dieplay, but every one geta tird d the same thing year after year. Now, if some of these beds were edged with Dainien, Violan, Aubristim, \&ce, they would certainly prove more interenting ind attractive. Even carpet-beds could be made of tho different varieties of Dainies, which, I ventare to uy, would prove more interesting and be betterapprecind than this one solid mass of bunch Primrosen, as variety is charming at all times, and we have plenty of nato rials wherewith to make spring bedding charwing One would think that apring beddiag is lonirg ground, for we hear very little of it now-even thi three champion places, Aston, Cliveden, and Belvoir, are silent. Now the Daisy is a very important littio thing in spring bedding, easy of culture, a genert favourite, and can be adapted for almont any rart of artistic work; it is true we have not much varisty in colour, but enough for most parposes required fos 10 uturdy a little grower, and I would much like to see it more brought into caltivation again. I had s fine collection at both Osberton and Eaville jut formed when I left, and spring bedding war given if I had, at the latter place, all the varieties I could pro cure, variegated and otherwise, and found amplo colour and variegation with the aid of other thiret for all my requirements. It neem quite nanecemins to give any inatructions as to its calture, being ouly a Daisy-but atill a few remarks respecting it mily not be out of place. The best soil suitabie arm Daisy would seem to be a good allavial loam, mo by drained - a too light soil is soon penetrator by drought. Propagation is best done in the sprime dividing the roots an noon as they have done flomerime selecting a rather wady pot for their munally quarters. Numbers of Daision are lost sumaty through not sufficient care boing taken of them ant their removal from the flower-beds to the remed Daisie are apt to degenerate if they are permitud remain long unremoved; it is beat to have frean eant up every second year, planting them in from in prite For seedlings with a chance of variety, now bed il in a pan or box, prick off the aeedlings into plath summer, attend to watering and weeding fower sol and by the autumn many of them will fort bat continue doing so until stopped by frost, ther start again al soon as the milder wean should permit. From these plantw the beat E, four selected and the remainder thrown awly, E. Bu Lyne, Chertsey.

## THE FRUIT CROPS.

[For Tabulated Summary, see p. 119.]

> (Cont inued from p. 152.)
2. ENGLAND, N.E.

Nobthumberland.-The Apple crop is quite extraordinary, with the trees in plendid health. Pears on walla irregalar. Plums on walls and in the open are very fine, eapecially Denyer's Victoria. Of Gooneberrien, red Currants and Strawberrie the crop is quite exceptional, finer than we have had for many years. George Harris, The Castle Gardens, Alnwick.

Apples an average good crop. Stirling Castle, Ecklinville, Hunthouse, Domino, and a few other varietiea are bearing heavy crops. Pearu not so good. All amall fruit are good. Strawberrie and Rappberrien are excellent; Raspberry Saperlative is first-class variety, it is the heavient cropper of any I have tried, and it meem to withatand dry weather betcer than any other. Goosebernies and red Currants enormone crops. All treen and bushes are very healthy. David Inglis, Howick Hall, Lesbury, R.S.O.

Durham,-Apples and Pears are about the average, on some trees none at all. Thim applies to the early llowering aorts, the cold east wind having cut off the blosoms. Strawberries were a bad crop, owing to the dry weather, and Raspberries are few, the evere winter having killed most of the canes. The greenfly and nmut was very bad, but of late the thunderstorm: have washed the frait. $R$. Draper, Seaham Hall.

Yorkshire,-Strawbertien in thia district were a heavy crop, excellent in quality, and at thi place they were ripe in abundance by the middle of June, which is very early for this district. Laxton's Noble was the first to ripen, and the crop of it was a heavy one, the frits large, and owing to the dry weather the flavour was good. It is an excellent variety and stands the drought well. Next in the order of ripeniag was J. Ruokin, the crop heavy, bat quality poor; Black Prince came next, a heavy crop, and excellent in quality; President and Sir J. Paxton were large and good, and the latter kept in bearing very well; Elton Pine, British Queen, and Aberdeen Favourite, were fine cropa, of good quality, Morellon and sweet Cberries carry heavy crop:; Apricota are a thin crop outaide, but there is an abundant crop in our open shed. Of Pear-trees on wall., Easter Beurré and Bearı́́ Diel have nice crops. Lord Saffield and Keswick Codlin Applen have good crops of frait. B. Wadds, Birdealk, York,
-- Strawberrien have been an exceptionally heavy crop, the individual frnits large, and of excellent flavoar. Applew will be plentiful with us, the younger trees bearing very heavy cropi of fruit where they had ahelter from the cold cutting wind which prevailed during the flowering time. Damana are abundant, but the frait is likely to be amall owing to their great abundance, $J_{0}$ Riddell, Castle Hovoard Gardens, York.

Applen showed remarkably good blonom, but were aeriously affected by the cold winds and atorma from the north and north-east about the middle of the month of May. In favoured epota Apples are, perhapi, above the average. Pear and Plams showed only moderate blossom in this diatrict. Cherries nowed plenty of blossom, but the cold clayey natare of the soil is not adapted to their saccessfal cultivation; only Morellos do well. Apricots, the heavy crope of which so exhauted the trees daring 1894, and the growth being made late, did not get ripened. Small fruit are excellent, except black Currante, which are almost a failure. J. P. Leadbetter, Tranby Croft Gardone.

The cold, wet, sunless autame of 1894 has left ite mark on the fruit crops of 1895. Io apring the firat aurprise wan the almout total sasence of Apricot bloom. Peare and Plums did not carry nearly their uanal amount of bloom, and it was amall and weak, not eithing well; a few trees on walls with a south aapect are bearing hemv cropn. Applen bloomed fairly well, but the crop in not in
proportion; the earlier varieties appear to be carrying the beat crops. Strawberries most abuadant and good. Gooseberries, Raspberries, red and white Carrants extra good. Black Currants not so pleatifal, but clean and good. Willian Higgie, Stanwick Gardens. Darlington.

- The very hot and dry pring weather has much benefited all ontdoor crops of fruit. Apples are looking uncommonly well, especially free-growing culinary varietien, which is rather remarkable after the plague of caterpillar we had; but thanka to the use we made of the garden hose, we cleared this plague off. Pears, too, are promising well, also Plums, Cherries and Strawberries. I never saw more or better fruits, bat the latter, through continued heavy rain, rotted ere they ripened. J. Rubert Dawes, Temple Neusam.

Applea in this district are a good average crop. A few kinde, viz, Lord Saffield, Keswick Codlin, Prince Albert, Nonsuch, Yorkshire Greening, Eanter Pippin, Greenup' Pippin, and Tower of Glamia for instance, are carrying heavy crops. Peara are a fair average crop, both on walle and standard. Plams have fair crope, and a few have full crop:. The Gooseberry bushen were dreadfully infested with caterpillars of the sawly; I never anw them so bad before. Of Strawberrien, President and Vicomtense H. de Thury were by far the best out of many varieties. J. Hughes, Wentworth Woodhouse Gardens.
Cambridgrshire.-The fruit crops here are, with the exception of Plams and Apricots, very good. Apples are the best crop that has been for some time. Pears were nadiy thinned by the cold winds, and are nothing near a crop. Plums also nffered from ame cause and through the dronght. Gooseberries and late Strawberrienare very mall. Peache and Nectarines are, as unaal, very good, although a lot of the unripened shoot were killed by the frost. Apricots were spoilt from the same cause. Qainces are a crop. Taken on the whole, it is the beat frait crop that has been for some years. J. Hill, Babraham, Cambridge.

- The fruit crop in this district is good on the whole, with the exception of Pears; Lane's Prince Albert being by far our best cropning Apple, Ecklinville Seedling coming next. The red-spider is a very bad plague in most gardens hereabouts on Grooseberries, the result of neglect, there being plenty of water in this district, and any ordiasry force-pump on wheels, with a small pipe and a tap to regulata the quantity of insecticide, would anawer. I find petroleum the best thing to drem the trees with, and in ita paanage through the pump and a few lengthe of the hose it becomes well mixed with the water. It is fatal to the black Curraat-hud mite. Wilson C. Smythe, Upwell House Gardens, Wisbech.
Esscx. - Applen are remarkably good, the treen clean and healthy. The great drought stopped the growth of these and all other large and amall fraita, but all are now going on healthily. The Stramberry crop was exceptionally good, and all mall fraits abundant, but they affered greatly from drought, and on that account Gooseberries lacked flevour. Jas. Douglas, Great Gearies, Ilford.
Lincolnshire,-Apples upon the whole are a good average crop, although in mome casen it is a very partial one, the severe atorms of May 17 and 18 having greatly damaged the blomoms and foliage where exposed to the full force of the wind. Pears are a very light crop; Apricots, scarcely any of the trees suffered much daring the winter; and Peach and Nectarine trees on a south-eant wall are bearing abundantly. All treed are now making good and healthy growth, not having suffered so much from the drought here as in soms localities. The rainfall for June was 270 inches. The Gooseberrycaterpillar is very troublesome. E. F. Hazelton Broaklesby Parle Gardens.

Sufforis. - The Apple crop in thil district is at only under the average, bat is very partial. Here and there a tree carries a fairly good crop, while on others not a fruit is to be meen. I consider the
failure is entirely owing to the continued frost and catting wind that prevailed during the fowering period, as all the trees were masses of bloom. Years are thin, but the fruit promises to be good. Apricots are a failure. Peaches and Nectarine are very good. Plams thin, bat Cherries are a good crop, both dessert kinds and Morellos. Strawberries were excellent. All emall fruit are very abundant. $H$. Fisher, Flipton Hall Gardens, Bungay.

Apples variable; most old treen well clothed after month of dropping, which palie the crop up to an average. Peara mach whipped by winde, as well as checked by droaght. Pinme decidedly scarce ; few blooms, which set fairly well. The only fall cropt of the Plum family are Bullaces, the black, where grown, being at heavily laden as the common Bullace. Peacher and Nectarinea are a full averagn, but Apricots are thin. Gooseberries, Carrants. Rasperrien, extra cropa, amaller than usual from lack of rain. Walnut trees much injared by the February frosts; very few Nute. D. T. Fuh, Bury St. Edmunds. The everity of the winter months, coupled with the low night temperatares which continued up to the end of April, had a diesstrons effect on fruit crops; the growth of fruit trees was slow and weak, on Apple treen there was a prevalence of insect which riddled the young leaves, Peari also affered, then drought aet in, and daring the monthe of May and Jane only nine-tenth of an inch of rain fell. In some casea Apples that appared to have set freely in spite of unfavourable conditions now dropped off, strewing the groand, and those left refused to grow larger. Peart also fell off, but at an earlier atage. Strawberries muffered greatly on light woil, the frait was mall, and almost cooked on the plants when ripe. Cherrien have been clean and good. Plams are a short crop, and Apricots almost a complete failure. John Wallis, Ot well Park Gardens.

The fruit crop of 1895 promised to be an exceptionally good one, but the long contiaued drought was dissatrous to early Pears, and moat of the fraite dropped. Marie Looine, Doyenné da Comice, Bearré Diel, and later varieties of Peare are likely to be very good. Apples, eapecially the calinary varieties, are a fair crop and very good. H. Rogers, Rendlesham Gandems, Woodbridge.

## 4. MIDLAND COUNTIES.

Boceingamsmine-Although the drought interfered in some degree with the Strawberry crop, in other respects it did bat little mischief. Among notable eabjects in this department, the early varietie of the Peach demand a remark. Early Beatrice, Early Amsden, Waterloo, and Alexander have produced excellent crops of frait of good aize and quality-in fact, they ripen outside even before our good old early varieties with the asnistance of glass; these are, therefore, an acquisition aufficiently great to be appreciated. G. T. Miles, Wycombe Abbey.
-. Generally speaking, the frait crops of South Backe are well up to the average. Applez in some districts are over average; here we have a fair crop. Of orchard tree Quarrenden, King of the Pippins, Coz' Orange Pippin, Datch Mignonne, Welliagton, Fearn's Pippin, and Starmer Pippin are heavily laden, while Blenheims and Ribstoas and wome others are very thin. Of a number of bash-trees on the Paradiee atock, Lord Growvenor and Grenadier, two early cooking Apples, invariably crop heavily, and this year look remarkably well. Other kinde also bearing good crops are Ecliaville, Pott's Seedling, Lord Derby, Warner's King, Cox'e Pomona, Cox's Orange Pippin, Worcester Pempain, Prince Albert, Stoae's Apple, Ribston, and Bramley's Soedling. Pare on walle and bath- treen are scarce, whilo a few orchard-trees, Beań Clairgma, Loaise Bonne of Jersey, and Autucan Baygamot are cropping heavily. All varieties of Peaches and Nectarine have required a considerable thinning of fruits, but notwithetanding the loog wpell of drought look remarkably well; this latter remark appliea to all fruit trees. Apricot are rather under average crop. Plame and Cberrie good. Small fraite and Suranberriea very good, although the latiar uffered
somewhat from the dry weather. Nuts are very plentifal throughout this district. Chas. Herrin, Dropmore, Taplow.

- Piums and Applex a very heavy crop, breen clean and healthy. Among early Apples bearing freely are Irish Peach, Mr. Gladatone, Lord Saffield, and Seaton House. Among Strawberries, Royal Sovereign, British Queen, Laxton's Latest of All, and Waterloo have been very fine. J. Smith, Mentmore, Leighton Buzzard.
- Apples Lord Saffield, Lord Derby, King of the Pippins, Cox's Orange Pippin, and Blenheim Orange are very good here; in fact, the Apple crop is decidedly a good one. The following varieties of Pears are carrying good crops, viz, Comte de Lamer, Pitmanton Dachess, Bearré Clairgean, Vicar of Winkfield, Black Worceater, Marie Lonies, Eatter Baurré, Louise Bonne of Jersey, Glou Morceaa, and Doyenné de Comice. F. Capp, Wexham Park Gardens, Slough.

Cebshire,-Applen are very good crops, more especially the following uneful varieties:-Lord Saffield, Lord Grosvenor, Grenadier, Hawthornden, Cellini, \&ce, which are overloaded with fruit. Pears are very good crope, too, Marie Louise, both on the walle and in the open, being fall of fruit. Victoris Plums are so heavily loaded with fruit that the branches require support, other kinds fair. Robt. MacKellar, Abney Hall Gardens, Cheadle.

With the exception of Apricots, which are almost a failare here, the fruit crop in a most astisfactory one. Apples are a very full crop, the fruit remarkably clean, and the trees free from blight. Plume and Damsons are also a full crop, in some casen, trees of the latter have suffered a great deal from spider. Pears are mach below an average crop. There was very little bloom in the early apring, donbtlen accounted for by the hesry crop: carried laet year, and this remark applien to Apricots as well. Strawberriee have been a very henvy crop, and of excellent quality. With me, Royal Sovereign has established its claim as a first-claes second early variety for pots, as well as outside. Cherries and mall bush froitu are an abundant crop. Old brakes of Rapberries suffered somewhat severely from the frost, but younger brakes have carried enormons crops; and out of a number of varieties, I find Superlative the best. N. F. Barnes, Eaton Hall Gardens.
Derbyshirs.-Apples and Pears, favoured with magnificent weather whilot in blossom, set a prodigioan crop, bat the long-continued drought thinned them considerably, and advantageously. Pears, however, are atill a very heavy crop, particularly such varieties as Jargonelle, Beurré de Capiaumont, Easter Beursé, Vicar of Winkfiela, Williama' Bon Chrétien, \&c. Oar heavient crop of Apples are Gravenstein, Keawick Codlin, Emperor Alexander, Cellini, and Northern Greening. Oar newly-made Strawberry beds suffered terribly through the exceptional veverity of the winter, hundreds of plants being killed outright. Ben Ashton, Glosop Hall Gardene.

The prenent seaton is one of the mont fruitfal we have had for many yeart, both in gardent and orehards; the trees are literally loaded with fruit, and considering the long apell of dry weather we have experienced, the trees are wonderfully free from insect pesta. Jo. Bottrell, Sudbury Hall, Derby.
Leichertesehres,-The Apple crop on atandard trees is heary in this district, especially of the varieties Bienheim Orange Pippin, Wellington, Qieen Caroline, Dachess of Oldenburgh, Kentish Fillbasket, Lord Suffield, and Pike's Pearmain. Pyramidal trees have fair average crops of Duchess of Oidentargh, Domino, Pott's and Bramley's Seedling, Pince Albert, Frogmore Prolific, Newton Plppin, Braddick's Noupareil, Lord Lennox, Water100. Fearn's Pippin. Golden Rawet, and Irish Peach. Alfred Hamshere, Beau Manor Park Gardens, Lough.
borough.

- Apple treen are remarkably healthy this year, and the fruit is wwilling well. Some of the trees are mithout frait, owing to inclement weather,
and nevere attacks of insects laat season, which weakened them considerably. Pears set well, but have fallen mach aince from maggot and other cansen. All bushes are clean and healthy, but Gooseberrien were severely attacked by caterpillars daring the late dry hot weather. W. H. Divers, Belvoir Castle Gardens, Grantham.

The crop of Apples this year is particularly good, pyramid trees on Paradise stocks being heavily laden, and require severe thinning. Bismarck, Seaton Honse, Lord Grosvenor, Stirling Castle, Frogmore Prolific, Prince Albert, Cox's Pomona, Potte' Seedling, Warner's King, Tyler's Kernel, and The Queen (Saltmarsh) are amongst the most noticeable. Of orchard atandards. Keawick and Manx Codlins, Ecklinville Seedling, Queen Caroline, Winter Hamthoraden, and Bramley's Seedling are the best. Amongst Pears on the walls, Marie Louise, Passe Colmar, Bearré Sterckman, Winter Neli,, and Lonive Bonne are the mont productive. Raspberries, Gooseberries, and Red Currant are abundant. Stramberries have been a phenomenal crop, bat the bulk were soon over, owing to the drought. All fruit treen are clean and in good condition. Danl. Roberts, Prestwold Gardens, Loughboro'.
Oxfordshire, - The anripened shoots on the lower parts of Peach trees were killed by frost, bat the crop nevertheless is a good one. Amsden's Jane, Alexander, and Waterloo Peachen were ripe on July 24. Strawberry President was particularly abundant and fine. Fruit trees of all kind, have kept remarkably clean this year. G. Stenton, Park Placs Gardens, Henley-on-Thames,

- Frait trees this year are, on the whole, almost free from green-fly, the revere winter probably having deatroyed their egga. Considering how acarce Applen were laat year, it is remarkable that we should have another bad year following, for although early vareties are plentiful enough, the later and main croppers are very deficient. The trees had acarcely any blonom; perhaps the cold wet summer had most to do with this failure A. J. Long, Wyfold Court.
Shropshire.-Apples fall crops, though partial in places, some trees loaded and othern bare, many falling throagh drought. Pears are thin and mall. Plums especially plentifal on walls. Damson trees are breaking down with the weight of their crop. This year's rainfall for May was 060 , for June, 10 Last year it was for May, 304 , and for June, 24 , these figures speak conclanively as to the drought. A. S. Kemp, Broadway, Shifnal.
- In this district Apricots are the only fraita that are a partial failure, which considering the cropa of the paat two years is not aurprising. Applen are a heavy crop, and the trees very healthy. Many varietien are grown, and all are good. Unfortunately a hailatorm of nnusual neverity passed over this neighbourhood on Jaly 21, damaging the Apple crop badly, cutting and bruising the frait. Peara are a good crop, Marie Lonise better than last season. Peach and Nectarine trees are bearing good cropn. Plame have not required so mach thinning, but the tree have a fall crop. Sraall fruits have been abundant and good, but caterpillars have been bad on Gooneberries and Carrants on north walls. Strawberries have been very plentiful, and Laxton's Noble, President, and Waterloo, are the varieties that do best and keep up a long succention. This season we are discarding Sir Harry, Lord Napier, Vicomteane Héricart de Thary, Elton Pine, and Serling. 8. Backhouse, Onslow Gardens, Shrewsbury.

Staffordshire. - The Apple crop in this district is the beat we have had for some jeara, such varietien as Keswick, Lord Saffeld, Manx Codlin, Cellini Pippin, Small's Admirable, and Stirling Castle, being *o loaded with fruit, it would almost pay to thin them. Pearn are a good average crop, and promize to be good in quality; the same may be sidid of Plums. Cherries have aleo been very good ; and Strawberries excellent both in crop and quantity. Noble, that hae the character of being defficient in flavour, has been very good this year, conld not wish for better flaroured
froit. Gooseberries and all kinds of Curranta bam been plentiful and good. John Wallis, Keele Gardem, - It is the first time I have been able to gim you such a good report of the frait crop genernily from this district. Almost every Apple tree is loaded with frait, free from blight, and where proper thinning has been done a good harvest may be looked or : in many cases old dwarfed, most-covered, and In. bound Apple trees, that have been atraggling for existence for years past, are wreathed with mull fruit this year. Pears on wall are good average crop and quality, standarde are remarkably healthy al good. Caerries, small fruits, and Strawberriee (unde good culcivation), have been all that could be deimen Some of the carses of part failure other years han bsen caused by late spring frost. I mast also wh that birda have been reaponsible for a great deal by taking the bude in winter and spring, the frott insa winter has greatly reduced their number-lean buh were taken this year than unual. H. G. Wikks, Sandan Hall Gardens, near Stone.
Warwicishires.-The wealth of blonom on ill frait trees and bushes, except Apricots, hat man than fulifled expectationa, for the abundance of friut matured and mataring has not been equalled for mag yeara. Apples of mont varieties asually grown an almost breaking the trees, Plums also requiring to propped up. The drought of May and Tane told a the eize of Strawberries, but the quantity and quility quite compenated for that. A. D. Chritie, Bayle Gardens.

> (To be continued.)

## ROOT PROPAGATION OF SHOW

 AND FANCY PELARGONIUMS.A capital method of propagation, but one that in not mach known, is by means of root-catting. $\Delta 1$ soon as the flowering weason is past-any, in July "f Augast, the planta are tarned out of their pote, the atronger roots cut off, the whole of the soil shan clean off, and the root-mase washed in water to make them clesn. After this is done the plath should be repotted in fresh soil. By this repotiing the gardener is rewarded by a number of fine larg roote, which can be removed withont inflicting tho least injary to the plante. The atronger roots anoll be placed in catting-pots, the thicker end jafi appearing above the surface of the soil. The baif kind of soil for the cattinge consists of peat and de cayed hot-bed manare. The cattings should be lighty watered-in, and afterward occasionally aprintles Of course, they must at first be put into a frame, ase kept close, and shaded, bat as soon as growth sppetin ample ventilation must be afforded. Shoota beristo appear in fourteen dayb, and an ar rale seeveral of the appear on each piece of root. When there allole have reached a desirable length, the point mas ${ }^{\text {b/ }}$ taken off and treated as a catting, if further incrum be required. The rooted plants should be repotite when the catting pote get fall of roota, and at nehal depth that the point of origin of the ahoot or thoolt comes below the surface of the soil.

## LILIUM PARRYI.*

AT one of the recent meetings of the Royal Hent cultaral Society, flowering specimens of the sbow named citron-yellow, fragrant Lily (fg. 42, p. 2 were shown by Mesers. Wallace of Colchenter. An

[^14]plant is as yet little known, we append the following particulars taken from Elwes' noble monograph:"Extract from Dr. Parry's account of the plant:${ }^{06}$ In one of my last botanical excuraions in the vicinity of San Bernardino in July, 1876, I accepted an oft-repeated invitation to viait the intelligent brothers J. F. and F. M. Ring in their mountain
aion of the South Pacific Railroad. In one of these monntain nooks the Mesara. Ring have located a Potato ranch, the elevation of over 4000 feet giving a anffisiently cool, moist climate, while the adjoining mountain-alopes afford an extenive nmmer cattlerange long after the herbage of the lowland hav dried ap.
ap with rank Willow and Alder growtha, and oceasionally expand into amall meadons of coarue grasa and sedges.
" 'On all the steep gravelly slope sadjoining, there was the usual display of Californian evergeen shrabbery, inclading the Heath-like Adenostoma (which, uader the name of 'chamisal,' in largely

retreat near San Gorgonio Paar. Lemving the broad and pictureqque basin of the Santa-Anna Valley near the emergence of the atream from the rugged mountain-wall of the San Bernardino range, our route, after crosning Mill Creek, hagged the foothille bordering the Upper Yucaipa valley; thence, by a more rapid acent in a nearly direct easterly courte, we reached an elevated bench ecattered with Pine and Oak groves, overlooking the Eroad aweep of the San Gorgonio Panf, now tiaverted by the eastern exten-
" ' In scattered groves of Pinus Cuulteri, the ground was strewn with the massive cones of this peculiar species, ite denae scale armed with formidable hooked pine:. Many of the conen were fully 6 inches in diameter, with a length of 9 inches.
"'The fev perennial watercournen here met with are montly confined within deep and inaccessible ravines; but more frequently scanty springe ocze ont from beneath deep layers of porous strats, and opread out into boggy marahes, generally choked
used for frel), the Holly-leaved Cherry (Prunus ilicifolia) exhaling a atrong odour of bitter almonds. the Heteromeles arbatifolia, with glossy varniahed leaves, and a prevalent form of 'California Lilac' (Coenothan cramifoliat), with thick leathery foliage. The dall green hat which everywhere characterises the moorish growth, is at this time of year partly relieved by brilliant carlet fettoon of Pentatemon cordifolius trailing over acjoining bushen, or the len chowy blowome of P . ternatas.
"Bat what soon attracted more exclusive attention was a conapicaon yellow Lily growing abandantly on the boggy ground adjoining Mearts. Ringe' hoase, and sharing with the Potato- patch the care and attention of the undisputed possessors of the soil. Though not so showy as some other members of the Lily family in this region, there is a grace diaplayed in its large drooping flowers, surmounting a slender stem benet with narrow acattered leaves, which are occanionally crowded at the base into a distinct whorl.'

Trees and Shrubs.
sambucus racemosa, red-berried ELDER.
Tris plant atands out well at the present season as an object of beanty, with it cluaters of coral-red berries ; and so fond are the birds of the ripe seeds, that plant from the voided seeds are found all over the garden, and in some instances in exactly ideal positiong. For instance, we have averal large apecimen growing among trees, Box towering well above them, and I think that a better groundwork could not be found for the Elder than the Box. Oar stock of plants is also increased by cattings pat in daring the autamn.

## Sambucts nigra folifs atbeis.

Thit in another capital garden ahrab, and well adapted also for planting near the margins of woods and at the sides of the approaches to the mannion. It nhould be eeverely cut back in the apring if it in to look ita best. The plants at this place grow in peat bede among the Ghent Azaleas, and the foliage of these colours well.

## Sambucus migea var. folits lutbo marginatis,

This is a variety of the common Eider, which I can recommend for planting in a uhrabbery or on the edge of woods. It retains its variegation when planted in partial shade, in fact it grows satisfactorily under the shade of trees. [A: does the type. Ed.] Herbert May, Markree Castle, Sligo.

## Rubes lastostylus.

The number of Rubi known to botaniats has been very considerably increased by the explorations of Dr. A. Heary in China, bat our knowledge of most of thene new species is at present dependent on herbariam specimens. R. laviostylas, however, a speciea discovered by Dr. Henry in 1888, in the province of Hupeh, China, is now in the living collection at Kew, having been raised from zeed. It flowered for the first time in Jane, 1894, and has recently been figured in the Botanical Magazine (6. 7426). The flowers are mall, and the petals of a bright reddish-parple. They are, however, very fagacious, and whatever value the apecies may ponsess from the horticultural standpoint, lies in its being an addition to the white-atemmed kinds, of which we have already three or four in cultivation leucodermis, biforas, \&es. The atems of this new apecies are at prement 4 feet high, thickly armed with pricklen, and covered with a bluish-white bloom which rubs off at the touch. The leaves are pinnate, the leafeta masply and irregularly arerrated, and the mid-rid and petiole armed with short apinen. Having stood the winter of $189 t-5$ with no protection of any kind, and quite uninjared, it may definitely be included among perfectly hardy shrub. W. J. $B$.

## Clerodindron thichotomons.

The only apecies of Clerodendron of traly shrubby habit that is hardy in England is C. trichotomam. It in a native of Japan, and is found in various parts of that country. Although it is anid to have been firt introduced in 1800, it is far from being as extennively cultivated ase ite beauty and diatinctneus from all other hardy shrabs entitle it to be. It grows to a height of 10 to 15 feet, the wood being aoft, and the branches largely componed of pith, The large, broadly ovate leaves are soft and of a
many of the Clerodendrons, emit a divagreeable odour when braised. The flowers appear during the months of Auguat and September, and are produced in loose terminal cymes. The corolla is white, the lower part being tabalar, bat the apper part dividea into five spreading, oblong segmentr, and measures $1_{2} \frac{1}{2}$ inches across. Surrounding the corolla, and making an effective contrast to it, is the purplered calyx, which is infated, and traversed by âve ridges. The species is easily increased by means of suckers and root cattings. W. J.B.

## Magnolia gilatuca.

Whilat the American representatives of the genas Magnolia never display that magnificent wealth of blossom which renders the Asiatic species and bybrids the most lovely of apring-flowering trees, they possens sufficiently good qualities to make them indispensable to every garden with apace enough for their development. They flower, too, when their allies from China and Japan are long past. Juat now M. grandiflora and M. glauca claim most attention. The latter is somewhat hardier than M. grandiflora and its flowers, although much smaller, have a more exquisite, if less powerful, fragrance, suggesting at once a delicious fruit, and a bunch of Tea Roses. The flowers are never seen in great numbers at one time, bat a aingle shrab will keep ap a succersion of them for ten or twelve week. Each Hower is from 2 to 3 inches in diameter, and cupshaped, the colour a soft creamy-white. In some localities in the United States this Magnolia attains the dimenaions of a mall tree, with a well-formed slender trank, but in Britaia it rarely gets beyond the shrabby state. It usually retains a large proportion of its foliage throughout the winter, bat different planter vary a good deal in regard to the persistence of the leaves, some, even in mild seasons, becoming almont bare. The leaves are oblong, mooth, and glossy-green above, but vividly glancona beneath. The apecies has been in cultivation in Eagland over 200 yeara. There is a fine varitty of it known both as major and as Thompsoniana. It has larger leavea and flowers than the type, and is equally fragrant. W. J. B.

## THE DEVELOPMENT OF THE <br> CARNATION.

By the mereat accidental circumatance a vinit was paid recently to the gardens of Mr. John Garnett, nurseryman and florist, at Bownen-onWindermere. Here we fortunately encountered the urbane and genial proprietor, whone extensive stock of every description of flowering plants is a rare aight to be reen, cultivated on what appears to be little better than rocky barren ground; but the reverse is the cave, though the blue, ragged limestone of the district projects above ground in every direction, and that forms a grand neatling place for an immense collection of rare and other Forns. Bat Mr. Garnett figures most prominently at a breeder and raieer of Carnatione, of which there are many hadreds of difforent varieties growing in the open in a light woil, which evidently overlies a rocky foundation. The richnens and parity of the prodactions prove that the ground is well adapted for the parpose, many of the blooms measaring $4 \frac{1}{2}$ inches in dismeter, and showing good sound calycen and brilliancy of coloar, in which many of the tinte of the rainbow can be discerned. Mr. Garnett's great aim for wome years past has been to produce a blue Carnation, and be considers that he in now on the brink of succem. Many scores of blooms were pointed to as ponesaing the akyblae tint on the fringe of the petale, bat it is inside one of the glamhouser that the coming
flower is carefully tended. The carefally tended.
The great difficulty, as Mr. Garnett explains, wa to obtain the proper combination of opposite coloura for a foundation to work upon, which is an entirely different procens to that adopted by the artist; bat after continued perneverance his effort have been rewarded by a zingle bloom of pure indigo-blue, chowing only the faintent shade of violet on the
caly

This plant differs cousiderably from the rest o the stock, and has but a weak and rather wickly appearance; but Mr. Garnett is firmly convinced that if he can retain it and induce it to prodee prolific seed, that by a cross with another varien upon which he has already fixed, but of which bu did not reveal the name, he will meet with the result which he seeks, and in the course of another remove or two will be able to prodace a brighe blue Carnation.

Many other experiments which he has made in hytho dising have produced remarkable and beantiful effio and a short time previously he had deapatched twa three single fowera to the Carnation and Pieta Uaion for inspection, though not with a viem on competition. A letter just received from the secretur and treasurer, Mr. Arthar Medharat, showed the these had attracted the attention of the jadges, ul in reference to them the following was embodied in the jadges' general report: -" "The seedlings thow gooi blood, and are decidedly promising; bat an it in rule to give certificates only in cases of two or man blooms of one variety being shown, no award did certificate could be made on this occasion mithou infringing the rulea." J.W.

## KNIPHOF'S BOTANICA IN

## ORIGINALI, 1758-1764.

The name Kniphof, as commemorated in the gena Kaiphofia, is not unfamiliar, bat comparatively fun persons will know anything of the history of the man who was the author of the work of which tho above is the abbreviated title. An uacat coppy this rare and carious botanical book has lately bem added to the Kew library. It is interesting historcally, both on account of ita being a record of plath cultivated at that date in Germany, and chiefly, in all probability, at Erfort, as it was there the autior resided, and also on account of its being one of the earliest, if not actually the first, work of considerably extent, in which the process of natare-printing we employed to illustrate plants. It woald appear thit D. Brükmann, a contemporary of Kaiphof, wa redly the inventor, if it may be so termed, of thir method of representing plantu, as there is a publinhed leftre by him on the subject addressed to Kaiphof, dud 1733; but this is not in the Kow library. The eith is, Sendschreiben an J. H. Kniphof, die Art dic Rrãim nach dem Leben abzudrucken und also comp sndiow ITr baria picta zu machen, vorstellend. The foll tittod the work in question is, Botanica in Origimlis som Herbarium Vivam in quo Plantarum tam Indigonans quam Exoticarum peculiari quadam operosqque nndiriw atramento impressorio obductarum Nominibunque mim ad Methodum Illustrium nostri aevi Botanicornm lim naei et Indwigii Insignitarum elegantiwsina dijf exhibentur.
Trampe.
There are two foolscap folio volumes contsinim 1202 figuren, one on each leaf, besides a nanter introduced on the title pages of the twelve partiil which it was issued, for the purpones of embaliew ment, making a total of 1250 apcies repretearith Figure 545 is miasing. The Kew copy is prow unique in being coloured, the colouring being math likely the work of a private person, for there in 10 mention of coloured copies by any of the billiontr phern. The colouring is generally well and tively done, though in some instances it is then for extent neatralised by the too intense blachan the print. This copy first belonged to J. G, 1 , M.D., Professor Pablicus Primarius at Cologie, 1 , neems to have acquired it in 1764 , the dably pablication of the last part. Subsequentij it have passed into Eaglish hande, as some permed written, in a very neat hand, the Eagliti many of the plant.
The arrangement is alphabetical, with the $I$ names of the first edicion of the Specias and refereaces to the pages of that work, the Systema, and Ladwig'" Definitiont Plantarum. The "specific phrases" of the Plantarum are also reprodaced.

## STREPTOCARPU'S LAING'S

 MULTIFLORA.ImPROTIMENTS are taking place with rapidity in the size of the flowers, and in the colonring of Streptocarpus. The plant now vie in beauty with Gloxinias, and in general usefulnes and length of

## A MOTH-CATCHING PLANT.

The following curioun atory of a well-known plant appeared a ahort time since in the Detroit Free Press, under the title of "A Moth-catching Plant." The plant in quention, the Araojia albens, or as it is now known an Arajo aericifera, is described by

Fig. 43.-streptocabpes multiflora.
time that a plant will remain in flower greatly excel theep plants. The variety depicted in our illustration ( 6 g. 43), was exhibited by Menry. John Laing \& Sons. Foreat Hill, at the Rogal Horticultaral Society's meeting on Taesday, July 9, of the present year. The flowert are of a blaikh-parple ground coloar, with parple lines in the throat. Tuere were thirty open flowers borne by the plant, which wat growing in a 5 -inch pot.
our contemporary as a native of South Africa, when it is, in fact, a native of Pera. It is , however, stated to have been introduced to Now Zanland quite accidentally about aeven years ago, and since then to have been extensively propagated there on accoant of ite effective service as a killer of destructive moths. Wherever the climata is mild the plant is an exceedingly free grower. Is twines and climbe with great luxariance, and prodace
immeneen"numbers of white or pinkith flowers, which have a very agreeable scent. These flowers attract innumerable moths. On a sammer evening a hedge of Arajias will be covered by a perfect cloud of mothe, and in the morning there will not be a single flower that does not imprison one or two, and sometimes as many as four, insects, of various sizes and genera. The action of the Araojia is parely mechanical. The calyx of the fower is rather deep, and the receptacle for ita aweet juices is placed at ita base. Attracted by the powerfal scent, and the prospect of honey, the moth dives down the calyx and protrades its proboscie to reach the temptiog food, but before it can do so, the proboscis is nipped between two strong, hard, black pincers, which gasrd the panage, and once nipped, there is no escape for the moth, which is held as in a vice by the extreme end of the proboscis, and dies miserably. The rationale of the process is not get explained. A plant of Arajjia, covering a apace of 10 yards in length, will destroy many hundred of mothe every night, and consequently prevent the ravages of fifty times an many larve. It is bowever a singular fect that in New Zealand, where the plant has often been caltivated for the expreas purpose of destroying the detested Codlin-moth (Carpocapa pomonella), that wily insect declines to enter the trap.

## APOGAMIC FERNS.

Acthooger the discovery of apogamy, or the power of the Fern prothallus to prodace the epore-bearing generation by simple budding, instead of through the interaction of the antherozoids and archegonia, dates back some twenty year, a practical application of the koowledge then gained and publibetd by its discoverer, Profestor Farlow, and sabsequently by Profeasor A. de Bary, appears only now to cone into question when the hybridising and crossing of apecies and varieties is being conducted on a aytematic basis. We have been led to this concluaion by the fact, that for the parpose of obtaining a crested Cyrtominm, we made not long since several sowiage of spores of C. falcatum and C. caryotideam mixed with spores of Lastrea paendo-mas cristata, thinking that, as these two apecites were very clovely allied, the chances of a crine were great. Pending, however, the appearance if the young plante, a stady of the literature of apogems in connection with the carious prothalla illast ased in your columns (Nowember 10, 1894), of waic'। more amon, led at to D, Biry's discovery. ret lorth in the Botanische Zeitunq, Jaly 19. 1873, and the following numbers, of the fact that precisely L. form. criatate and C. falcatum are invariably prodaced apogamoualy, that the first cariously enough jactifies its common name of male Fern by never b-aring archegonia, while the wecond only produce these aparingly and never perfects them-bade, and bude only, being prodaced in both cases. Ojviously, therefore, a cross is imponible. Unfortanately for the ordinary Fern caltivator, the development of Ferns in this asexual way, demands the atmost alkill of the microscopiat for its determination, since the Ferna so produced uecally apring from precisely the ame parte of the prothallas nt those jielded sexaally, and being of exactly nimilar appearance cannot be diveriminated from them by ordinary observation. Heace if such pitfalls are to be aroided as the one we have described above, the would-be hybridiet mast look to the specialiat in microscople dissection to help him, and we think renewed research in the line of D3 Bary's inventigations would well repay the trouble. In the frat place, although De Biry tested a considerable number of Forna, and found the large majority capable of normal, i.e., of sexaal reprodaction, thirtysixindeed asagainat three (Pteris cretica, Lastrea flixmase cristata, and C. falcatam), yet in thone days the pouible diccoveries in connection with abnormal varieties were almont entirely ignored, and of the thirtynine Fernu named by D \& B ary, only three are abnormal, of which, bo it noted, one, Lustrea filix-mas cristata,
is constantiy apogamons, though the normal un crested form ie not so, the apogamy being thus corre lated with the taaselling, a point to our mind of great importance. The folly of applying the term of "garden varietien" to many of our abnormal forms is seen in this connection, since D3 Bary alludes to L. filix-mas cristata as such, and asomes, therefore, that the date of origin can be ascertained while, in point of fact, it was found wild, and is as purely a natural product, i.e., as independent of haman caltaral influences as the common normal form.
Another point is, that the crested male Farn has been found as widely differing and altozether independent aports in varioue parta of the British Isles, the whole of the thren anb-species, L. propinqua, L. filix-mas, and Lo paendo-mak, having afforded examples. We ourselves found a aplendid form of L. f.-m. polydactyla near Kilmarnock, and a thorough L. f.-m. criotata at Kitruah in Ireland Mr. Dadds found exsmples at Ilfracombs, Dr. Wills near Cbard, and extreme forms have been found eleewhere. Now it is here that the Fern epecislist should go hand in hand with anch inveatigstors an Da Bary, in which case we nhould probsbly know, as we now do not, whether apogamy in always correlated in this apecies, i.s., in all three rab-divisions with cristatus, or in a relatively varging degree, or not at all. A point aloo would have been that varions ab-varieties exist, and did then exist which are the repated offapriag, sad in themselves bear evidence of being so of the identical L. f.-m. cristats, which is in queation. L. f.-m. crittata angurtata is one of these, and more recently, that lovely ailken form, L. f.-m. crictata fimbriata has been rained, while denes narrow-crested form raised by Mewrr. Lang of Kirkcaldy, bear! every evidonce of being a crom between L. f.-m. c. anguatata, and one of the dwarl forms of the same apecies From these facts, it is clear that within this single section of the varions crested male Ferns, there are ample ponibilities of further light being thrown apon apogamic reproduction, since though we have no reason to asnume apogamy is a bar to variation any more than other bud-forming phenomena, zet the reputed cromses point diatinctly to exceptions which $\mathbf{D} \rightarrow$ Bary failed to find.
Oar Britigh Fern varietier, we are convinced, are replete with possibilities, their diversity of form being, se we know, attended occasionally by anch modifications of reproductive energy as were quite undreamt of. Externally, they form a chapter of wonder to any one who cares to stady them, and it would be atrange indeed were thin diversity all *kin-deep only, leaving nothing for that deeper renearch which we auggert.
Raverting to the curiout prothallus mentioned nowe, the two horns developed therefrom bear at present two similar Athyria, thav, at any rate, affordiag an inatance of true apogamy in that family, the normal form of which, as well ss A. f.f. Frizollize were found by De Bary to be normally fertile. In thir cave tbe phenomenon appears in a different form sltogether from sny noticed by him, the seate of the bulbils being far remored from the archegonial nites, of from any projection unch as he observed in the indentation of the prothallas. Each Fern shows three frond, one developed, and bearifg n) lese than ten pairs of pinnate pinne, inutesd of the wasal much simpler primary frond. Rootr, however, are only $\begin{aligned} & \text { Iow forming, and the plants are }\end{aligned}$ consequently of very slow growth. One very cariove fentare it that the horn bearing thene plante, and which were at firut sharply pointed, are now in both caser diating at the tipw, the stronger of the two forming a diutinet Ieshy prothallus. A eccond prothallas in the asmo batch developed a similar but maller horn direct from the apper aurface; a bud appeared on thit in preciely the ame fathion as the others, but the resalting plant, also an Atayrium, is of very differeat form, promising to be well crented, while the others are plain. Nothing at all akin to thir cam hav, we believe, been noted or reeorded hitherto. Chas, T. Druery, F.L S.

## Plant Notes

STOCK PRINCESS ALICE AS a bedding PLANT.
This comparatively new $\quad$ triety of Stock is a decided advance and improvement on older varieties, and formes a very beantifal nabject for bedding pur poses. It is of snowp whitenes, perfect habit, and a continuons bloomer. Raised in heat in March, and plented out early in May, it blooms from Jane antil cat down by frost. Large beds have been planted in the groands auder my charge thim neason, having a broad edging of "Croton-leaved" Bent or scarlet Verbena, and the effect is charming. Its also seems to me to be more pewerfally fragrant than other Stock. W. H. Aggett. Bermondsey, S.E.

## The Aplary

the treatment of robber bees.

## IT is easy to prevent bees robbing each othes'

 hives, if the hive of the robbers can be ascertained. Search should be made for it, and when found famigated with mask or camphor, so as to give the bee living in it a strong mell, by which the bees in other hives will know, and be warned acainst them. It is also good to give the robber bees some work to do in their owa hive by trewing the floor with chaff, newdut, \&e.; and to tara the robbed stocks to face in another direction, or place them eleewhere. Placing the hive of the robbers in a cool, dark cellar way aleo be recommended. If the bees then acquire better behaviour, they will bave forgotten their robber habita. If the robbors are the property of a neighbour, he should be requeated to pat these regulations in force.
## The Week's Work.

## THW HARDY GRUIT GARDEN

## By W. Pope. Gardswer, Bighclern Castle. Newbury.

THINNING THE CROWNB OF ORCHARD TREEB,
ETC. - Now is an excelleut time to operate on the tops of orchard or other tandard trees that may have failed to fruit, or on early kinds that need it after the frait has been gathered, in taking out muperflanas wood, and so admitting a little anlight and air to the interior. It is neceesary to proceed cautionaly with old and hitherto neglected trees, as thinning in their case may paily be over done, and tha ramedy is then nometime worse than neglect. While the foliage is on the trees, it is easy to see where to thin out branches with advantage to the tree, and by taking out a fe small ones here and there, or a larger branch occanionally when deemed necamary, in a few yeary many treen now practically worthlen might be annaally bearing fairly remunerative cropa of fruit. It in a good plan the firat year to take out all croaing and interacing branchen; thil, with shortening a faw overgrown spare here and there, will often be sufficient for one meavon, and it ahould be followed by a good duating with quicklime as aon at the leaven have fallen. Thiv, if applied whilat the tree are damp, will dentroy lichens and monsy growth, and conduce to the health and well-being of the treen
preparationa for planting.-Those who contemplate planting to any extent hould make a point of visiting some good fruit nursery at this season, and melect the trees required to be sent a soon as the leaves fall. It is alway more satisfac tory to the purchaser if he can select bis trees, as be thea know exactly what to expect from the pureryman when the time comes to plant. It will be well, too, to prepare the ground at once, if it can be ao managed. When a border or quarter ir to be plented, the ground whould be tranched at leat two sit deep, making eare that the drainage is good; and if not, the land must be thoroughly drained. If some good tarfy loam can be obtained, for placing roand about the roots when plantiag, all the better; if not a heap of compost hould now be got in readines, which may consint of road-scrapings, decayed and charred vegetable refane, wood-anhen, or the like, which mould be put into a begp and turned two or three times. If wall frait-tree are to be planted, the
tations may be prepared by trenching and drainiag but the holes should not be left open. It is well to preserve all old mortar, plaster, \&ce, for mixing with the soil in which stone fruits are to be planted, a well as for working-in round the roote of exituing trees which may require it.

## TET ORCRID HOUSES

By W. H. Whitr, Orchid Grower. Beerford. Dotking.
REPAIRS AND MAINTENANCE.-At thie segeon the heating-apparatus should be overhauled, and put into order tor the winter searon. Tbe boilers shoth at least be cleared of sediment, if nothing elogh done, and the doing of this will empty the pipes of water, but they should not be left empty. If the boilers have manhole or openings that are lame enough for a scraper or iron chisel to be ased, the incrustation which is aure to take place with ordi nary water at points where the fire is hottent, cen perhaps be removed. This will easble the boiler to do it work more efficiently, and ave the materis of the boiler trom being destroyed by the action ol the fire. Loose joints in the hot-water pipes mat be made good; valves oiled, and overflow and foel pipes put in good order. The fire bars, fire-lampa flues round and ovar the boiless, and ash-pit doors abould receive attention. The hard frosts of lat winter mut have neverely tested the heating capacity of man $a$ toiler, and proved the inefficiency of othere, and nom ia the time to make provision for anotber minter. Ualess an Orchid grower bas an apparatas that will maintain the right degree of warmth in biu houses, the plants mat suffer in bealth. Some persons are under the imprestion that $\boldsymbol{*}$ long a th pipes are as hot as they can be that is aufficient, butitio a mistake, for the plant. quickly detertorate whem pipes have to be kept fiercely hot on purpoes to wirn the air of the house. It is better to furnish more and keep them moderately warm. When this kin of work is to be carripd out the plants should bo allowed gradually to become dry. I allade to thom species which occupy the hottest houses. If durivg the performance of the work any of the plants appar to onffer from drgnesp, water may be affuded in about one-hali the usual quantity.

CATAEETUMA, MORMODE8, ETC.-Partieuly attention whould be given to plants of Cataetari Mormodes, and Cycnoches, which having bloomal have finished growth for the searon, in the matter of maturing that growth by and-heat. Sach plant bould be placed where they may obtain ninater rapted sunshine, and the atmosptere is dive and leas close than the houses they ham hitherto occupied. Whilnt the leaves remsin frem keep them nupplied with water at the yoos When the growth is properly matared the plast will go for a very long period uniojared, witaum receiving any moisture at the root. So soon as mot leaven turn of a yellow colour, the water supply muk be gradually reduced, and when they drop, diccot. tinued entirely. If the psendo-balbs keep pluy looking no more water will be required before Li plants beain again to break. Cgrtopodiam, sochilas, Cyrtopera, Thania, Bletia, and the decidaw Eulopbias may be similarly treated. As regardon of these pecies, it is certain that the treaman fforded during rest is as important as that durile their growth.

## THE KITCEEN GARDEN

By Jobr Lakbeht, Gardener. Powis Caule Foldpol
box edginas. - From now onwards, them edgiaga may be trimmed; sud in order to give dug and other creatures bat little covert, the edgim Box should be kept to about 2 inches in height, the ame in width at the bottom, and 1 inct top. When Box is cat at this season, new, nof growth has time to mature, and is, therefore, browned by frout, which is the case with lave the ming. Repaira may now be made, althong thy apring is a better time for lifting and divino plante. Box, to look nice, should be kept rery line whether curved or atraight, and cat very at the top and nidea.

THE COLLECTINO OF GEEDS -Seedr of Spisal Borecole, Tarnip, Broccoli, and Cabbage mation Lathered as fast as they become ripe, or beat in the plant palled $u p$ by the root. Lay the sped and whe eun on clathe or tray". Do not collect sedd onf damp with rain or dew. Tarn the aed-d occasionally, and in about a fortnight they at is be quite ready to ba threabed or abbed ouk mainy weather, and durnug the nighto the to be placed under coumr. Open aheds sull tinlit to ba pleced uader

CARDOONB.- The earliest plants are now ready for blanching. For this parpose procare hay-bands -not masty ones; and when commencing the job, put a strip of wide bast around the leaf-atalkn, to keep them better together, and then wrap them in haybbands, being careful to place each coil close to the next one, so as to shat out the light.
fennel and angelica.-Fennel and Angelica may be sown at this date, instead of in the spring, some gardeners fancying that autumn-sowing gives stronger plants. Sow the aeed thinly on a piece of ground, in an open place.

ONIONB. - In some parta of the country the Onion crop is atill in fall growth, but as moon as the majority of the balbs show signs of the tops falling over, a man should go with a wooden rake and press over the tops generally, and in ten days afterwards, if the weather is sunny, the crop should be lifted, sud the bulbe laid out in a dry shed or on sheephardies, \&ce, in the open. When dry, twist off the leafy part and the outermost akin, and store in a cold, dry room. Keep the spring and autumn oown produce apart ; in fact, the difforent varieties should be stored in according to their use at different easone. If the bulbs are roped, that job can be done at leisure.

## FRUITS UNDER GLABS.

## By Rtora rd Parker, Gardener, Goodwood, Chichester.

PRUNING.-The advantage of pruning the different kinds of frait trees soon after the crop is gathereds and before the foliage falls, is not so generally known es it should be. The gardener who prunes then, is in a better position to see what quantity of wood is required to properly farnish a given space, and the removal of superflions growth gives that of the current season a good chance of thorougbly mataring, a very essential condition for good fraiting. Peach and Nectarine trees ahould have all of the weakly or unfruitfal wood cat out; and it may be necessary to cut back some of the stronger growth where crowded, as in all cases sufficient space must be allowed for the fall development of the leaves. Care must be taken to retain young fruitful wood in anfficient quantity at the base of the tree. Some of the stronger shoote on thene fruit trees in the earlier houses may also be slortened back, and any growtha that were tied acrose others, wo as to enable the sun to reach the frait, may be loosened, thas exposing all parts to the action of direct sunshine. In the case of the Cierry, Pear, and Apple, whose shoots were pinched, so as to compel the fruit-spars to form on them, these will in the course of a ferm years become crowded, and the foliage very denae, by praning these trees at this season it will be an eabier matter to se which fruit-spars ought to be removed to enab.e light to penetrate the crown.

FIG-TREES.-These will require bat little praning et this season if they were properly managed during kroxth, atill, it may be denirable to cut back weak shoots, but not the extremitien of the main oner, as it is on these that the earlieat fruite form.

WATERING. - Water should be copiously afforded to Prach and Nectarine treen, dryneas at the rootn at tho weason often causing bud-dropping at a later date.

8YRINGING.-Continue the nyringing of fruit treen and Vines twice daily during hot weather, and where posible, the roof-light may be taken off the houste.
tomatos.-Plants that have been placed in thelr fiuisug pots should not receive much water at the root; the stem should be secared to a stout Nakn. and the side growth removed-pulled out. Utilive any apare lighte daring rainy weather, to keep the plauts dry.

## THE PLOW ${ }^{\text {PR }}$ GARDEN

By Batcuy Wadds, Gardener. Birdsall Gardens. Fork.
FLOWER GARDEN ARRANGEMENTB FOR NEXT SEABON -The present ie a good time to decide upon may alteration that may be required to be made in the bedding-out next season, and the number of the plante needed to fill the bede. It is alwaya a good thing to make some alteration in the arrangements of the culours. so an to impart freahness to the scenc. The fashion of aning plants so as to give toanta of coloar is disappearing in favour of lone Fividnes. by the cue of plante of varied habit, fuliage, \&c.

DAHLIAS.-The various how, fancy, pompon, Cactas, and the varieties of single and decorative Dahlias, might be more employed than at present in the beds in the flower garden proper. We possess in these plant beantifal colours which are not to be found in any other sammer-flowering plants. Dablias, moreover, are plants eanily propagated, and stored when out of bloom. The doable and single varieties of Cactu Dablias being particularly attractive, should be largely used in bed and borders, or in the kitchen garden for catting parposes. Good varietien are H. Cannell, Dr. Mastery, Lady Marmam, Mr. A. W. Tait, Marchioneas of Bate, Rayon d'Or, Harry Freeman, Claxton Harlequin. Mra. John Arnold, Matchleas, Mrs. A. Peart (grand), and Dake Alexis.

PROPAQATION.-For nome few weeks to come, the propagation of hardy and half-hardy sabjects will require anremitting attention. Pelargoniums struck in the early antumn flower more satiofactorily than those raised in the apring, and the cuttings atrike freely out-of-doort up to the middle of the month of September.

CENTAUREA CANDIDIB8IMA.-If ide shoot be taken off old plants, they will atrike freely when inserted in pots filled with sandy soil, placed in a warm house and shaded for a fortnight. For affording cuttings, it is necessary to keep nome plant in pote, and if the planta are kept somewhat dry, they mase number of ide hoote suitable for cattinge. When the Centarea is required to make a epecimen plant, several years elapse; but for an even batch of small plants for making panelling or edginge, seedlinga raised in February are the more anitable.

FUCHsiAB. - Cattings of the varieties which stand an ordinary out-of-doore winter, viz., Riccartoni, Meteor, Coralliaa, and Elegans, ahould row be struck in alight botcom-heat ander a hand-glass or in pots. Fuchsia Riccartoni is a very useful plant in ehrubberies and as solitary plante on the tarf, and in some districts it will stand our winters well and grow to a great height. It can be increased by offsets and division early in the pring.
balvia fulgens and 8. patens.-Cuttings will atrike in a moist, warm frame if carefully thaded at this season. Salvia patens being tuberout-rooted may be lifted and atored away for the winter after it is cat down by frost.
succulentr. - The propagation of Sempervivam, Mesembryanthemam, Sadam, Kleinia repene, $\& c$, should be now pashed on. These cuttings should not bs inserted as soon as made, bat the cut surface allowed to become dry. Place cattinga in a pit or frame in moist noil, bat afford no water for a time, and no shading.

TUBEROUS - ROOTED BEGONIA8. - Cattinge strike freely in boxed or pots in an siry frame, affording them but little water, and not depriving them of light and air, their treatenent generaly being that of the zonal Pelargonium.
miscellanequs. - Helictrope, sweet-scented Verbena and Cape Pelargonume used in bedding, Ageratum, Lantana. Hydrenga. Verbena, beddiag Tropmolume Mins Clibran and Scarlet Bedder, are clant. which may now be struck from cutticgn. Kooaigs variegata is a useful plant for edgings, and variegated Alysam saxatile deserves to be used more than it is. It surikes and growa well, and is most useful for ummer edgings ; also Nierembergia gracilis and fivularis, beautitel for edgings of mail heds, and for filling baskets, but seldom sepn now. Babinas thesp, Gezania splendens, and Autathea coeleatis, a pretty blue Marguerite, and Mangle's variegated Pelargoniam, and the varieties of Anagellis, crimson, blae, and white; Lobelie speciosa in variety, are plants required to be kept as succk, cuttinga of which should now be rooted. All of them s'rikereadily on aslight bottom-heat, carefallvahading them whilst the wn shiner, and keeping the light close, except for an hour in the morning to ditsipate moisture and dry the leaves. To keep the young plante atncky, the cutting-potim mat be pot more than 6 or 9 inches diatant from the glass. When it is seen that any potful of catting is rooted, remove it to a more dry frame.
herbaceous borderb.-Seedling perennials and biennials raised last month should be transplanted from the need-bede to the border in piaces remarved for them. Dig in some rotiten manure before planting them, place a amall stake ugainat
each to ave them from being trampled upon, and afford a watering. The present is a good time to plant permanentily prepared offets of various hardy herbaceous and perenaial plants, as they will be enabled to get eatablithed before the seamon of growth comen to an end.

Bowing seeds. - The seed of Sweet Peas, Digicalis, Dalphiniam, Aatirrhinum, Pentatemon, Poppy, Mignonette, \&c., should now be gathered, and dried in the whade. Our Sweet Peas, that were nown in pots and transplanted, have been very beantifal objects, the varieties being Counteas of Kadnor, Princens Beatrice, Mra. Gladetone, Captain of the Blues, and others.

## PLANTR UNDEHE GLABE.

By W. B. Smith, Gardener, West Dean Park, Chichester.
NERINES (GUERNBEY LILIE8) will require Watering in every case, and those which have not exhibited aign of flowering will carcely do so now. Nerines do not flower astiafactorily if distarbed at the root; bat if it is a necessity to increase the stock of the plants, any potfuls that are much crowded with bulb may be haken ont, divided, and the bulbs re-potced separately in flower-pote of 3 to $4 \frac{1}{3}$ inches in diameter. The compost employed in potting hould consist of tarfy loam, leaf-mould, and mand, and a manall quantity of finely-broken charcoal The pots should be thoroughly well crocked. Very little water will suffice for thea newly-potted bulbs, and a light syringing overhead will be beneficial Bulbs that need no re-potting should be top-drensed with the above compost, or afforded a little of Clay' Fartiliser in the proportion of a teaspoonfal to each 32-nized flower-pot.

FANCY PELARGONIUMS-Old planta will now be ready for being pruned hard-back to well-ripened wood of the current gear. After praning, place them in a common frame close to the glaes, and when they commence to break, shake the soil from the roots, tarn the latter slightly, and repot them in pots of the same or maller ize, presing the soil with moderate firmners. Replace in the frame, syringe regalarly, and affurd air at the top and bottom of the lights. Cattiage of these wavisties which were pat in at the beginning of last month, being rooted, will be ready for potting into 3 -incle pota. A suit able soil will conist of turfy loam and leaf soil, with a small quantity of sharp asnd if the loam be heavy.

COLEUB. - The present is a good tiane to atrike a quantity of cattings for stock parposes, as theme keep better through the wiater in suall pote, than older and larger planta. Moreover, they do not cceapy so much pace. Coleus cattings strike almont anywhere now in a little bottom - heat They keep perfectly thronghout the winter, if placed on a shelt clone to the glans in the stove.

PINKB-In case the quantity of Carnatione for winter and apring flowering is limited, some of the older plante of the Pink ahould be potted up, planting them in a cold frame and keeping close for a few days. The plants soon make fresh roots, and may then be stood outnide. Before kard froste set in place them in cold frames. They may be gently foreed into bloom, commencing in Janary. Suitabla varietiea are Mrs. Sinkins, Ernent Ladbams, Her Mrjeaty, Mrr. Lakin, and Mr. J. M. Welsh.

A New Pencil.-The Blaiadell Paper Pencil Company, Philadelphia, U.S.A., has introduced a kiud of pencil, the lead of which is seen, on examination, to be covered with many very narrow stripe of paper. The peacll never neede catting in the ordinary senwe of the word, but, to expose more lead, all that is necesnary is to make suall alib in the paper near the lead, thue raising tiny flap. By gently pulling aud unwindiug this, working towarde the point, a spiral of paper is twisted off, and a length of the lead is laid barw. This procest can be repeated as required, till the pancil it too short to be used at all, and is less laborious, and is more certain in result than is catting with a knife. The lead is excellent in quality, and keeps a good point. In appearance thin pencil alweys reaemblea an ordinary cedar pencil, the "ancut end of it being covered with red glazed paper, which increase the likenes, and is pleanat to handle.

## EDITORIAL NOTICES.

Advertasements ahould be sent to the PUBLISEER.
Newspapers.-Correspondents sending newspapers should be careful to mark the paragraphs they with the Editor to see.
Local News.-Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is destrable to bring under the notice of horticulturists.
Illuatrations.-The editor will thankfully receive and select photographs or drawings, suitable for reproduction in these pages, of gardens, or of remarkable plants, flowers, trees, dc.; but he cannot be responsible for loss or injury.

APPOINTMENTS FOR THE ENSUING WEEK.

CORRRCTED AVERAGE TEMPERATURE FOR THE ENSUING WERK, DEDUCED FROM THE ORSERVATIONS OV FORTY-THREE TEABS, AT CHISWICK. $-60^{\circ} .7$.

Watering.
Therres is probably no one operation in the whole routine of gardening that is more thoughtlessly carried on than that of watering. The individual requirements of particular plants are little thought of, and "watering" is administered indisoriminately to each and all alike. Where there is a mixed oolleotion to be dealt with, the difficulties in adjasting the sapply to the needs of the individaal are, no doubt, great, but in market establishments, where large quantities of one plant are grown, and where s hoase or houses are set apart for the exclusive caltivation of some particular subjects, the diffizulties are materially lessened, though not overcome. In any case it is most important to gain a knowledge of the principles which govern the relations between the growing plant, the amount of water it receives, and the period at which it receives the supply.

That a plant needs water, suffers if it gets too little or too much, that it requires more at one time than at another, and that different plants vary in their requirements according to their conformation and structure, and the circumstances under which they are growing-all this, of course, is well known, though in practice it is often not remembered or acted on.
Again, the inflaence of exoess or defioiency of water may affect not only the individual plant, but may determine variations in the productiveness of the plant, and indaoe variations in the number, size and vigour of the seed and its contained embryo. Ia reference to these matters, the Reous Scientifique for July 6 pablishes a report of a thesia prepared by M. Edmond Garn, and presented to the Paris Faculty of Science. The general character of this thesis may be gleaned from what has already been said, but it may be of interest to at which M. Gars, a wel the conclasions on agricultural chemistry, has arrived, as they
are of great practical importance. There is, says M. Garn, an alternation in the requirements of plants for water. Continuous deprivation or continuous supply of water are alike contrary to the physiological requirements of plants. In all M. Gaxis's experiments those plants which were supplied with water at the two critical periods-the commencement of the unfolding of the leaves, and the beginning of the flowering period-and at no other time, did as well as those provided with a continuous supply of water during the whole period of vegetation. Further, the experiments of M. Gain showed that this influence of moisture is not felt equally by all the organs: it has a greater effect on the aerial than on the subterranean organs. The result of this differing influence is shown in the fact that plants grown in dry soil have thicker roots than plants in damp soil, though the stems may be equal in weight. This is in accordanoe with the well-known fact that plants of very dry countries have frequently roots which are very large in comparison with the weight and height of their aërial parts.

With regard to the influence exercised by the greater or lesser quantity of water on the propagation of the species, the researches of M. GAIN have established the two following facts, relating, the former to seeds, the latter to the tubers:-

1st. The humidity of the soil favours and greatly augments the number of fruit and seeds, but drought indaces the formation of larger and heavier seeds. On damp soil a plant yields smaller seeds, which, consequently, tend to bring about the degeneration of the species.

2nd. The number of the tubers is bat little influenced by the variation in the retentive powers of the soil for water, but on damp soil the plant yields larger tubers. There is then an increase in weight; the polarity of these tubers is, however, not mach marked, and they are consequently less perfeot than those which have been submitted, in the earth, to relative dryness.

It may be repeated that moistare perceptibly inoreases the immediate yield, but tends to the formation of imperfect reproductive organs, which produce less vigorous plants. This is to the advantage of the individual, but to the detriment of the conservation of the species. The practical inferences are obvious.
